Release Overview

The *Certus Closure Solution* software, also known as Certus, is a next generation design closure solution that enables engineers to perform distributed ECO on larger and complex designs. It provides enhanced performance and capacity by using the Paradime architecture that fully leverages multiple threads on distributed processes allowing maximum scalability. Certus provides a flexible computing environment, which ensures that a single user can perform subsystem/full-chip ECO timing/power closure, while reducing turnaround time from several days to hours.

Another advantage of this solution is that Certus allows users to perform ECO routing and parasitic extraction in batch mode, in order to collect updated parasitic, and perform updated timing analysis with signoff accuracy post ECO within the same session.

Currently, users perform timing analysis runs and ECO closure runs in separate sessions if the design has a large number of MMMC views. After the ECO closure run, users need to implement ECOs, collect new Verilog and SPEF data, and then perform post ECO timing analysis.

The Certus software addresses these usability concerns by automating all these steps through a single cockpit and a single session.

Other advanced ECO solutions, such as High Capacity ECO (allows to reduce database size), and SmartMMMC (allows compact timing graph when large number of timing views are used), are complementary to Certus.

For more details, refer to the following Certus documents:

- [Certus Text Command Reference](#)
- [Certus User Guide](#)

Release 26.10 Overview

The following is a high-level overview of the highlights and new features in this release.

New Text Commands

The following table lists the commands that were added to the Certus software. The second column identifies the chapter of the *Certus Text Command Reference* where the command is documented.

New Commands and Global Variables	Chapter
<code>generate_summary</code>	Signoff ECO Commands

New Command Parameters

The following table lists the parameters that were added to the Certus software. The second column identifies the chapter of the Certus Text Command Reference where the command is documented.

New Parameters	Chapter
<code>set_eco_opt_mode</code> - <code>custom_distribution_file</code>	Signoff ECO Commands
<code>start_gui</code> -designs	System Commands - Basic Tool-Tcl Commands

Manual ECO

Release 26.10 Enhancements

The following enhancements have been made:

Support for Distinct Resource Allocation for Certus and Tempus Clients

In this release, a new parameter, `-custom_distribution_file`, has been added to the `set_eco_opt_mode` command. This parameter specifies a file containing customized resource distribution information for the CPU and memory configurations of Certus and Tempus clients. This enhancement supports various resource requirements, helping ensure optimal performance.

Specify the following custom resource distribution details in `set_eco_opt_mode - custom_distribution_file <file>`:

- For every client, either for Tempus or Certus, or Tempus and Certus, use the below settings:
`module=<moduleName> view=<viewName> nCpu=<Number of threads allowed> {<farm distribution instruction>}`
- For client machine sharing, specify the View as `view=<viewName>` with one (or multiple) Modules, `module=<moduleName>`
- For two Certus clients sharing the same machine, specify `module=<moduleName>` twice on the same line (where the `nCPU` value is then divided by the number of Certus clients and provided to each Certus client).

For details, see the [Recommended Guidelines for Certus](#) chapter in the *Certus User Guide*.

New Command to Display Log Summary Report

In this release, a new command, `generate_summary`, has been added that displays the software's log summary report in a text file.
