Cadence Design Systems, Inc. (Cadence), 2655 Seely Ave., San Jose, CA 95134, USA.

Trademarks: Trademarks and service marks of Cadence Design Systems, Inc. (Cadence) contained in this document are attributed to Cadence with the appropriate symbol. For queries regarding Cadence's trademarks, contact the corporate legal department at the address shown above or call 1-800-862-4522.

All other trademarks are the property of their respective holders.

Restricted Print Permission: This publication is protected by copyright law and international treaties and contains trade secrets and proprietary information owned by Cadence. Unauthorized reproduction or distribution of this publication, or any portion of it, may result in civil and criminal penalties. Except as expressly permitted below, this publication may not be copied, reproduced, modified, published, uploaded, posted, transmitted, or distributed in any way, including automated processes, training or services involving a large language model, foundation model, deep machine learning, generative artificial intelligence, or any other similar process or technology, without prior written permission from Cadence. Unless otherwise agreed to by Cadence in writing, customers are granted permission to print one (1) hard copy of this publication subject to the following conditions:

1. The publication may be used solely for personal, informational, and noncommercial purposes;
2. The publication may not be modified in any way;
3. Any copy of the publication or portion thereof must include all original copyright, trademark, and other proprietary notices and this permission statement; and
4. Cadence reserves the right to revoke this authorization at any time, and any such use shall be discontinued immediately upon written notice from Cadence.

Disclaimer: Information in this publication is subject to change without notice and does not represent a commitment on the part of Cadence. Except as may be explicitly set forth in such agreement, Cadence does not make, and expressly disclaims, any representations or warranties as to the completeness, accuracy or usefulness of the information contained in this document. Cadence does not warrant that use of such information will not infringe any third party rights, nor does Cadence assume any liability for damages or costs of any kind that may result from use of such information. Cadence is committed to using respectful language in our code and communications. We are also active in the removal and/or replacement of inappropriate language from existing content. This product documentation may however contain material that is no longer considered appropriate but still reflects long-standing industry terminology. Such content will be addressed at a time when the related software can be updated without end-user impact.

Restricted Rights: Use, duplication, or disclosure by the Government is subject to restrictions as set forth in FAR52.227-14 and DFAR252.227-7013 et seq. or its successor.

About This Manual

The Cadence® Stylus Implementation System family of products provides an integrated solution for an RTL-to-GDSII design flow. This manual describes the syntax for the Stylus Implementation System (Stylus) text commands.

The chapters are presented alphabetically by general command functionality. Within each chapter, the text commands appear alphabetically.

Audience

This manual is written for experienced designers of digital integrated circuits. Such designers must be familiar with design planning, placement and routing, block implementation, chip assembly, and design verification. Designers must also have a solid understanding of UNIX and Tcl/Tk programming.

Conventions Used in This Manual

This section describes the typographic and syntax conventions used in this manual.

<i>text</i>	Indicates text that you must type exactly as shown. For example: <code>analyze_connectivity -analyze all</code>
<i>text</i>	Indicates information for which you must substitute a name or value. In the following example, you must substitute the name of a specific file for <i>configfile</i> : <code>wroute filename configfile</code>
<i>text</i>	Indicates the following: • Text found in the graphical user interface (GUI), including form names, button labels, and field names • Terms that are new to the manual, are the subject of discussion, or need special emphasis • Titles of manuals
[]	Indicates optional arguments. In the following example, you can specify none, one, or both of the bracketed arguments: <code>command [-arg1] [-arg2 value]</code>

[]	Indicates an optional choice from a mutually exclusive list. In the following example, you can specify any of the arguments or none of the arguments, but you cannot specify more than one: <pre>command [arg1 arg2 arg3 arg4]</pre>
{ }	Indicates a required choice from a mutually exclusive list. In the following example, you must specify one, and only one, of the arguments: <pre>command {arg1 arg2 arg3}</pre>
{ [] [] }	Indicates a required choice of one or more items in a list. In the following example, you must choose one argument from the list, but you can choose more than one: <pre>command {[arg1] [arg2] [arg3]}</pre>
{ }	Indicates curly braces that must be entered with the command syntax. In the following example, you must type the curly braces: <pre>command arg1 {x y}</pre>
...	Indicates that you can repeat the previous argument.
.	Indicates an omission in an example of computer output or input.
<i>Command - Subcommand</i>	Indicates a command sequence, which shows the order in which you choose commands and subcommands from the GUI menu. In the following example, you choose <i>Power</i> from the menu, then <i>Power Planning</i> from the submenu, and then <i>Add Rings</i> from the displayed list: <i>Power - Power Planning - Add Rings</i> This sequence opens the <i>Add Rings</i> form.

Overview

The following lists the Advanced Timing Tcl Scripting commands. For each category of similar commands, we explain what they are used for followed by some simple examples.

all_* Commands

The `all_*` commands return a collection of all the items of a specific type. Several of the commands provide options to filter the collection based on certain properties:

- `all_clocks`
- `all_connected`
- `all_fanin`
- `all_fanout`
- `all_inputs`
- `all_instances`
- `all_outputs`
- `all_registers`

Examples

- To set all the clocks to propagated mode, use the following command:
`set_propagated_clock [all_clocks]`
- To report the worst timing path that begins at a register and ends at an output port, use the following command:
`report_timing -from [all_registers] -to [all_outputs]`
- To store a collection of pins that fanout from a specific port, use the following command:
`set clk1Fanout [all_fanout -from clk1 -pin_levels 1]`

get_* Commands

The `get_*` commands return a collection of items filtered by name pattern or object type. Additionally, you can use the `-filter` option for most of the `get_*` commands to filter the collection by property value. See the [get_property](#) command for a list of all the properties.

The `filter_expression` for the `-filter` option can be created by combining several object properties using the following relational and logical operators: `>`, `<`, `==`, `!=`, `<=`, `>=`, `&&`, `||`, `=~`, `!~`, `AND`, and `OR`. You also can use parentheses to create expressions. The `get_*` commands include the following:

- `get_arcs`
- `get_cells`
- `get_clocks`
- `get_designs`
- `get_generated_clocks`
- `get_lib_arcs`

- `get_lib_cells`
- `get_lib_pins`
- `get_libs`
- `get_nets`
- `get_object_name`
- `get_path_groups`
- `get_pins`
- `get_ports`

Examples

- To return a collection of all input ports (same as running `[all_inputs]`), use the following command:
`get_ports -filter "direction==in"`
- To return a collection of pins that match `*/D`, use the following command:
`get_pins -hier -filter "hierarchical_name =~ */D"`
- To return a collection of the libraries a cell belongs to, use the following command:
`get_lib_cells INVXL`

property Commands

The `report_object_property_names` command lists the properties for the different object types. This command, without arguments, will list all the properties for all object types. Use the `-type` option to list properties for a specific object type. Legal option types are: `cell`, `clock`, `design`, `lib`, `lib_cell`, `lib_pin`, `lib_timing_arc`, `net`, `path_group`, `pin`, `port`, `timing_arc`, `timing_path`, **or** `timing_point`.

Examples

- The `get_property` command returns the value of the specified property. To report the clock period of `clk1`, use the following command:
`get_property [get_clocks clk1] period`
- The `report_property` command returns the properties and their values for a specified object. To report the properties for clock `clk1`, use the following command:
`report_property [get_clocks clk1]`
- For timing related properties such as properties for timing arcs, paths, and points run `report_timing -collection`. This will return the results in a collection of timing paths.

- To report timing and store the top 10 paths as a collection in the variable `$paths`, use the following command:

```
set paths [report_timing -collection -max_paths 10]
```
- To filter `$paths` to include only those paths with slack between -0.806ns and 0ns, use the following command:

```
set newPaths [filter_collection $paths {(slack > -0.806 && slack < 0.0)}]
```

collection Commands

Once you have the collection defined you can manipulate, filter, cycle through, and query it using the collection related commands:

- `add_to_collection`
- `append_to_collection`
- `compare_collections`
- `copy_collection`
- `filter_collection`
- `foreach_in_collection`
- `index_collection`
- `query_objects`
- `remove_from_collection`
- `sizeof_collection`
- `sort_collection`

Examples

- To list the contents of a collection, use the following command:

```
query_objects $collectionName
```
- To cycle through the items of a collection, use the following command:

```
foreach_in_collection iCell [get_cells *] {  
  Puts "Cell = [get_property $iCell hierarchical_name]"  
}
```

add_to_collection

```
add_to_collection  
base_collection  
second_collection_or_list  
[-unique]
```

Creates a new collection by adding objects from one collection to another collection. The following rules apply:

- If all of the objects in the base collection are of the same type, only the objects in the second collection that are the same type as those in the base collection are added to the new collection. If you specify an object list instead, all of the objects in the list must be the same type as those in the base collection.
- If the base collection contains different types of objects, all objects in the second collection are added. In this situation, you cannot specify an object list.

If the software finds no objects to add, an empty collection is returned.

Parameters

<i>base_collection</i>	Specifies the base collection of objects. Objects from the second collection or object list are added to this collection to create the new collection.
<i>second_collection_or_list</i>	Specifies the second object collection, or a list of objects.
-unique	Removes any duplicate objects from the new collection.

Examples

- The following command returns a collection which contains both the output ports as well as the input ports:

```
tempus> add_to_collection [all_outputs] [all_inputs]
```

Output:

```
CLK4 CLK3 CLK2 CLK1 IN4 IN3 IN2 IN1 OUT4 OUT3 OUT2 OUT1 OUT5
```

Here, the input and output ports are as follows:

```
tempus> all_inputs
```

```
CLK4 CLK3 CLK2 CLK1 IN4 IN3 IN2 IN1
```

```
tempus> all_outputs
```

```
OUT4 OUT3 OUT2 OUT1 OUT5
```

all_clocks

```
all_clocks  
[-help]
```

Creates a collection of all the clocks in the current design. If no clocks were defined, an empty string "" is returned.

To filter clocks, use the `get_clocks` command to create a collection of clocks matching a specific pattern. These clocks can be assigned to a variable or passed using another command.

Parameters

-help	Prints out the command usage.
-------	-------------------------------

Examples

- The following example applies the `set_propagated_clock` command to all the clocks in the design:

```
set_propagated_clock [all_clocks]
```

Related Commands

- `create_clock`
- `get_clocks`
- `set_propagated_clock`
- `all_inputs`

all_connected

```
all_connected  
[-help]  
[-leaf]  
obj
```

Returns a collection of all of the objects connected to the specified net, pin, or port.

Note: If you specify a pin or port object, the `all_connected` command will return the net connected to that pin or port. If you specify a net object, this command will return ports, pins, or hpins connected to that net.

Parameters

-help	Prints out the command usage.
-leaf	Returns all instance pins connected to the specified net. When specified, only the flattened connection points (leaf pins) for the specified net are reported. <i>Default:</i> Returns hierarchical ports connected to the specified net.
obj	Specifies the net, pin, or port for which collection of connected objects is to be reported. You can specify an object name, or a single-object collection.

Examples

- The following command returns a collection of all of the objects connected to the pin `b1_Sin1`:

```
all_connected Sin1
```

The software returns the following information:

```
Sin1
```

- The following command returns a collection of all of the objects connected to a pin contained in the single collection object `i_block1/b1_Sin1`:

```
all_connected [get_pins {i_block1/b1_Sin1}]
```

The software returns the following information:

```
Sin1
```

- The following command returns a collection of all of the hierarchical ports connected to the net

```
net_1:  
all_connected [get_nets net_1]
```

The software returns the following information:

```
TL2/l2_in TL1/l1_out
```

- The following command returns a collection that contains only the flattened connection points for the net `net_1`:

```
all_connected -leaf [get_nets net_1]
```

The software returns the following information:

```
TL2/L1/RX/D TL1/RX/Q
```

all_fanin

```
all_fanin
[-help]
[-hpin]
[-only_cells]
[-startpoints_only]
-to {collection | object_list}
[-trace_through {case_disable | user_disable | all | clocks | loop_snipped | latches}]
[-view view_name]
[-levels value | -pin_levels value]
[ > | >> ]
```

Returns a collection of pins, ports, or cells that exist in the fanin cone of the specified objects.

Note: The `all_fanin` command does not work on netlist traversal but on timing graph traversal.

Parameters

<code>-help</code>	Prints out the command usage.
<code>> >></code>	Writes a list of the returned collection to the specified file. You can add the <code>.gz</code> extension to the file name to generate a compressed report. Note: The file name must be the last parameter specified.
<code>-hpin</code>	Returns the hierarchical pins along with the flat pins.
<code>-levels value</code>	Specifies the number of gate levels to go back from a specific pin object to create the collection.
<code>-only_cells</code>	Returns a collection of cells in the fanin zone.
<code>-pin_levels value</code>	Specifies the number of delay arcs to go back from a specific pin object to create the collection.
<code>-startpoints_only</code>	Returns a collection only of valid startpoints (sequential cells and input ports) in the fanin cone.

<pre>-trace_through {case_disable user_disable all clocks loop_snipped latches}</pre>	You can specify one or more of the following options: • case_disable: Allows traversal of arcs disabled using the <code>set_case_analysis</code> command. The arcs disabled using the <code>set_disable_timing</code> command are not traversed. • user_disable: Allows traversal of arcs disabled using the <code>set_disable_timing</code> command, but arcs disabled using <code>set_case_analysis</code> command are not traversed. • all: Allows traversal through all the arcs. • clocks: Allows traversal through pins for which clock constraints, such as, <code>create_clock</code>, <code>create_generated_clock</code>, are applied. The pins that are disabled using the <code>set_case_analysis</code> and <code>set_disable_timing</code> commands are not traversed. • loop_snipped: Allows trace through the loop snipped arcs. • latches: Allows traversal of arcs of the latch cells.
<pre>-to {collection object_list}</pre>	Specifies the objects for which to return the collection. You can specify a list of objects, or a collection of objects.
<pre>-view view_name</pre>	Specifies the view name for which fan cone traversal is to be performed.

Examples

- The following command returns the collection of cells in the fanin zone of the output port OUT1:
`all_fanin -to OUT1 -only_cells`
- The following command returns all the valid startpoints (sequential elements and/or input ports) in the fanin zone of OUT1, allowing the traversal through arcs disabled by `set_case_analysis` and `set_disable_timing`:
`all_fanin -to OUT1 -startpoints_only -trace_through all`

Related Commands

- `all_fanout`

all_fanout

```
all_fanout
[-help]
[-endpoints_only]
[-hpin]
[-only_cells]
[-trace_through {case_disable | user_disable | all | clocks | loop_snipped | latches}]
[-view view_name]
[-levels value | -pin_levels value]
{-from {collection | object_list} }
[ > | >> ]
```

Returns a collection of pins, ports, or cells that exist in the fanout cone of the specified objects.

Note: The `all_fanout` command does not work on netlist traversal but on timing graph traversal.

Parameters

<code>-help</code>	Prints out the command usage.
<code>-endpoints_only</code>	Returns a collection of valid endpoints (sequential elements or output ports) in the fanout cone.
<code>-hpin</code>	Returns hierarchical pins along with the flat pins.
<code>> >></code>	Writes a list of the returned collection elements to the specified file. You can add the <code>.gz</code> extension to the file name to generate a compressed report. Note: The file name must be the last parameter specified.
<code>-from {collection object_list}</code>	Specifies the objects for which to return the collection. You can specify a list of objects, or a collection of objects.
<code>-levels value</code>	Specifies the number of gate levels to go forward from a specific pin object to create the collection.
<code>-only_cells</code>	Returns a collection only of the cells in the fanout zone.
<code>-pin_levels value</code>	Specifies the number delay arcs to go forward from a specific pin object to create the collection.

<pre>-trace_through {case_disable user_disable all clocks loop_snipped latches}</pre>	Allows traversal through disabled arcs. You can specify one of the following options: • case_disable: Arcs which are disabled using the <code>set_case_analysis</code> command and through physical constant are traversed. The arcs disabled using <code>set_disable_timing</code> are not traversed. • user_disable: Arcs disabled using <code>set_disable_timing</code> command are traversed but those disabled using <code>set_case_analysis</code> command are not traversed. • all: Enables trace through all the arcs. • clocks: Allows traversal through pins for which clock constraints (such as, <code>create_clock</code>, <code>create_generated_clock</code>) are applied. The pins that are disabled using the <code>set_case_analysis</code> and <code>set_disable_timing</code> commands are not traversed. • loop_snipped: Allows trace through the loop snipped arcs. • latches: Allows traversal of arcs of the latch cells.
<pre>-view view_name</pre>	Specifies the view name for which fan cone traversal is to be performed.

Examples

- The following command returns the collection of cells in the fanout zone of the input port IN1:
`all_fanout -from IN1 -only_cells`
- The following command returns all the valid endpoints (sequential elements and/or output ports) in the fanout zone of IN1, allowing the traversal through arcs disabled by `set_case_analysis` and `set_disable_timing`:
`all_fanout -from IN1 -endpoints_only -trace_through all`

Related Commands

- [all_fanin](#)

all_inputs

```
all_inputs
[-clock list_of_clocks]
[-no_clocks]
[-edge_triggered]
[-level_sensitive]
```

Returns a collection of input or inout ports in the current design.

To filter inputs, use the `get_ports` command to create a collection of ports matching certain criteria. You can assign these ports to a variable or pass them using another command. You can limit the contents of the collection to ports with input delay relative to a specific clock.

Parameters

-help	Prints out the command usage.
-clock <i>list_of_clocks</i>	Considers or limits the search to ports that have input delay relative to a specified list of clocks.
-edge_triggered	Returns a collection of input ports (specified with the <code>set_input_delay -clock</code> constraint), that have edge-triggered input delay.
- level_sensitive	Returns a collection of input ports (specified with the <code>set_input_delay -level_sensitive</code> constraint), that have level-sensitive input delay.
-no_clocks	Returns primary input ports that do not have <code>create_clock</code> or <code>create_generated_clock</code> constraints.

Examples

- The following command returns the names all of the input ports with input delay relative to an ideal_clk:
`all_inputs -clock ideal_clk`
- The following example lists all input ports in the current design:
`tempus > all_inputs`
- The following example sets the drive value of all the input ports on the current design to 10:
`tempus > set_drive 10.0 [all_inputs]`
- The following example marks with a multicycle value of 0 to the all paths from inputs having level-sensitive input delay relative to PHI1 to level-sensitive registers clocked by CDNSCLK:

```
tempus > set_multicycle_path 0 \  
    -from [all_inputs -clock CDNSCLK -level_sensitive] \  
    -to [all_registers -data_pins -clock CDNSCLK]
```

Related Commands

- `all_outputs`
- `get_ports`
- `report_ports`
- `set_input_delay`

all_instances

```
all_instances
obj
[-hierarchical]
```

Returns a collection of all instances available in a design, or all instances of a specified library cell existing in the current design.

Note: You cannot use the `all_instances` command on the top level of the design (`all_instances [get_design top]`).

However, you can use the command for hierarchical modules inside the top level. For example, if `SUB` is a hierarchical module in the top level of the design, you can specify the following command to return all instances of that module:

```
all_instances [get_design SUB].
```

Parameters

<code>-help</code>	Prints out the command usage.
<code>- hierarchical</code>	Specifies that the patterns should be matched hierarchically. If the hierarchical name of an instance at a particular hierarchical level matches the patterns, it is included in the result.
<code>obj</code>	Specifies the name of a design or a library cell in the current design. You can specify a pattern for the design or library cell name, or a single collection of a design or library cell.

Examples

- The following command returns a collection of all the instances of the library cell `BUF`:

```
tempus> all_instances BUF
```

- The following returns a collection of all instances of the sub-module `subblock`:

```
tempus > all_instances [get_design subblock]
```

```
subblock_inst1 subblock_inst2
```

all_outputs

```
all_outputs
[-clock list_of_clocks]
[-edge_triggered]
[-level_sensitive]
```

Creates a collection of all output ports in the current design. You can limit the contents of a collection to ports with output delay relative to a specific clock. You can assign these ports to a variable or pass them using another command.

Parameters

-help	Prints out the command usage.
-clock <i>list_of_clocks</i>	Considers only output ports with an output delay relative to a specific collection or a list of clocks.
-edge_triggered	Returns a collection of output ports with the <code>set_output_delay -clock</code> constraint.
-level_sensitive	Returns a collection of output ports with the <code>set_output_delay -level_sensitive</code> constraint.

Examples

- The following command returns a collection of output ports with an output delay relative to `ideal_clk`:

```
all_outputs -clock ideal_clk
```

Related Commands

- `all_inputs`
- `get_ports`
- `report_ports`
- `set_output_delay`

all_registers

```
all_registers
[-clock {clock_list}]
[-cells]
[-rise_clock {clock_list}]
[-fall_clock {clock_list}]
[-flops | -edge_triggered]
[-no_hierarchy]
[-latches | -level_sensitive]
[-macros]
[-master_slave]
[-data_pins]
[-clock_pins]
[-output_pins]
[-async_pins]
[-slave_clock_pins]
```

Returns a collection of instances and pins of flip-flops, latches, or sequential macros in the design. A cell is considered sequential if the library cell defines trigger or timing check arcs.

Note: The following options can be used only after building the timing graph:

- -clock
- -rise_clock
- -fall_clock

Parameters

<code>-help</code>	Prints out the command usage.
<code>-async_pins</code>	Returns a collection of async preset or clear pins.
<code>-cells</code>	Creates a collection of cells. This is the default option.
<code>-clock</code> <code>{clock_list}</code>	Specifies the name of a clock, a list of clocks, or a clock collection. The <code>all_registers</code> command returns a collection of registers clocked by the specified the clock list.
<code>-clock_pins</code>	Returns a collection of register clock pins. You can use other parameters to further filter this collection.
<code>-data_pins</code>	Returns a collection of register data input pins. You can use other parameters to further filter this collection.
<code>-fall_clock</code> <code>{clock_list}</code>	Specifies the name of a clock, a list of clocks, or a clock collection. The <code>all_registers</code> command creates a collection of registers opened by the falling edge of the clocks specified in the clock list.
<code>-flops</code> <code>-edge_triggered</code>	Returns a collection of edge-triggered sequential instances. Both the <code>-flops</code> and <code>-edge_triggered</code> parameters return the same collection. The <code>-flops</code> parameter is provided for backward compatibility.
<code>-latches</code> <code>-level_sensitive</code>	Returns a collection of level-sensitive sequential instances. Both <code>-latches</code> and <code>-level_sensitive</code> parameters return the same collection. The <code>-latches</code> parameter is provided for backward compatibility.
<code>-macros</code>	Returns sequential instances that are neither flip-flops nor latches.
<code>-master_slave</code>	Returns a collection of master-slave register cells.
<code>-no_hierarchy</code>	Searches the current design hierarchy level; does not descend the hierarchy into sub-modules.
<code>-output_pins</code>	Returns a collection of register output pins.
<code>-rise_clock</code> <code>{clock_list}</code>	Specifies the name of a clock, a list of clocks, or a clock collection. The <code>all_registers</code> command creates a collection of registers opened by the rising edge of clocks specified in the clock list.
<code>-slave_clock_pins</code>	Returns a collection of slave clock pins of the master-slave registers. You can specify the slave clock pins as <code>clocked_on_also</code> in the library.

Example

- The following command reports the 10 worst paths going to registers in the design:
- The following script uses the `all_registers` command along with other TCL commands to get the number of flip-flops in the design:

```
report_timing -to [all_registers] -max_paths 10
```

```
set flopName [all_registers -flops]
set flopCount [sizeof_collection $flopName]
puts "Number of flops in the design is $flopCount"
```

Related Commands

- `get_cells`
- `get_pins`

append_to_collection

```
append_to_collection  
[-help]  
var_name  
second_collection_or_list  
[-unique]
```

Appends objects from one collection to another collection. The following rules apply:

- If all of the objects in the base collection are of the same type, only the objects in the second collection that are the same type as those in the base collection are appended to the base collection.
- If the base collection contains different types of objects, all objects in the second collection are appended to it. In this situation, you cannot specify an object list.

If the software finds no objects to add, an empty collection is returned.

Parameters

-help	Prints out the command usage.
var_name	Specifies a pointer to the base collection of objects. Objects in the second collection or object list are appended to this collection. If you specify a pointer that does not refer to an existing base collection, the software creates a new collection that uses the pointer as a reference.
second_collection_or_list	Specifies the second collection of objects, or an object list.
-unique	Retains any duplicate objects that already exist in the base collection, but does not append duplicate objects from the second collection to the base collection.

Examples

- The following command appends the nets in the specified collection to the collection `newVar`:

```
append_to_collection newVar [get_nets {CLK1}]
```
- The following command appends the specified nets to the collection `newVar`:

```
append_to_collection newVar {Sin1 CLK1 Sout1}
```

- You can use the following commands to create another collection:

```
tempus 6> set base_clock [get_clocks sbw_clk]
0xe50
tempus 7> set top_clock [get_clocks aclk]
0xe51
tempus 8> set base_top_clock ""
tempus 13> append_to_collection base_top_clock $base_clock
0xe54
tempus 14> append_to_collection base_top_clock $top_clock
0xe54
tempus 15> get_clocks $base_top_clock
sbw_clk aclk
0xe55
tempus 16> get_clocks $base_clock
sbw_clk
0xe56
tempus 17> get_clocks $top_clock
aclk
0xe57
```

Note: If a new collection variable is defined with an existing collection, then both point to the same object set. Any modifications made into either collection will be visible in both cases - because they reference each other.

Related Commands

- [range_collection](#)
- [compare_collections](#)

compare_collections

`compare_collections collection1 collection2 [-order_dependent]`

Compares two collections, and returns a value of 0 if all of the objects contained in both collections are the same. If the objects contained in both collections are different, the software returns a value of 1.

Parameters

<code>collection1</code>	Specifies the first collection.
<code>collection2</code>	Specifies the second collection.
<code>-order_dependent</code>	Specifies that the order of the objects in both collections must be the same for the collections to be considered the same.

Related Commands

- `append_to_collection`
- `range_collection`
- `filter_collection`

copy_collection

copy_collection
[-help]
base_collection

Returns a collection that is an exact copy of the specified base collection.

Parameters

-help	Prints out the command usage.
base_collection	Specifies the base collection of objects.

Related Commands

- `append_to_collection`
- `range_collection`
- `filter_collection`

define_property

```
define_property
[-help]
-object_type string
-type data_type
[-lower_bound val]
[-upper_bound val]
[-string_values {values}]
property_name
```

Defines a new property.

Design objects can be associated with user-defined commands that can be used for analysis and debugging purposes.

You can use the `define_property` command if a `define` statement is not used for the specified property value(s). To read property values from the library, the command must be issued before the timing library is read.

Parameters

<code>-help</code>	Prints out the command usage.
<code>-lower_bound val</code>	Specifies a lower range - integer, float, or double.
<code>-object_type string</code>	Specifies the type of object on which the property is to be defined.
<code>property_name</code>	Specifies the name of the property.
<code>-string_values values</code>	Specifies the values that can be defined for the property.
<code>-type data_type</code>	Specifies the type of property.
<code>-upper_bound val</code>	Specifies a higher range - integer, float, or double.

Examples

- The following example defines property having object type `pin` and type of property `int`:

```
define_property -object_type pin -type int slk
```
- The following example defines a property on a library arc:

```
define_property -object_type lib_arc -type int libArcProperty
```

- The following example defines `aocv_weight` property on a library arc:

```
define_property -type float -object_type lib_arc aocv_weight
```

Related Commands

- `get_property`
- `set_property`
- `reset_property`

filter_collection

```
filter_collection
[-help]
base_collection
{filter_expression}
[-nocase]
[-quiet]
[-regex]
```

Returns a new collection of objects that were filtered from the specified collection of objects based on user-specified criteria (*filter_expression*). The original collection remains unmodified.

The following rules apply:

- The *filter_expression* can be created by combining several object properties using the following relational and logical operators: >, <, ==, !=, <=, >=, &&, ||, =~, !~, AND, OR. You also can use parentheses to create expressions.
- You can use the `defined` and `undefined` existence operators to determine whether an attribute is defined for an object.
- All design object properties supported through the `get_property` command can be used for filtering the base collection.

Note: You can perform filtering operations by specifying the `-filter` parameter with the `get_*` commands.

Parameters

<code>-help</code>	Prints out the command usage.
<i>base_collection</i>	Specifies the collection of objects from which to filter objects for the new collection.
<i>filter_expression</i>	Specifies the criteria with which to filter objects. The software adds any objects in the base collection that match <i>filter_expression</i> to the new collection. See "Examples" on how to create filter expressions.
<code>-nocase</code>	Specifies that pattern matching is not case sensitive. Note: You must specify <code>-regex</code> in order to use this parameter.
<code>-quiet</code>	Suppresses all the error and warning messages that are generated when the <code>filter_collection</code> command is run.

-regexp	Treats the specified patterns as regular expression patterns. <i>Default:</i> Treats the specified pattern as a wildcard.
---------	--

Examples

- The following command returns a single-object collection containing the pin with the hierarchical name `lat_3/Q`:

```
filter_collection [get_pins] {hierarchical_name == lat_3/Q}
```

- The following command returns a collection of pins that have a maximum slew greater than 0.1:

```
filter_collection [get_pins] {slew_max_rise > 0.1}
```

- The following commands create a new collection containing all those paths from the path collection with a slack value greater than -0.806 and less than 0.0:

```
set paths [report_timing -collection -max_paths 10]
set newPaths [filter_collection $paths {(slack > -0.806) && (slack < 0.0)}]
```

- The following command returns a collection of object names that do not match with “*clk*”:

```
filter_collection $abc {full_name !~ *clk*}
out in1 in2 in3 select TopBus[2] TopBus[1] TopBus[0] bidi
0x53
```

- The following command returns a collection of object names that are not “*clk*” only:

```
filter_collection $abc {full_name != *clk*}
out clk1 clk2 in1 in2 in3 select TopBus[2] TopBus[1] TopBus[0] bidi
0x59
```

- The following command returns a collection of object names that match with “*clk*”:

```
filter_collection $abc {full_name =~ *clk*}
clk1 clk2
0x5f
```

- The following command creates a collection of pins with `user_constant_value`:

```
set constant_pins [filter_collection [get_pins] {defined(user_constant_value)}]
```

Related Commands

- `append_to_collection`
- `copy_collection`
- `range_collection`

foreach_in_collection

```
foreach_in_collection  
[-help]  
var_name  
collection  
body
```

Iterates through all objects in the specified collection and executes the commands in the specified script body.

Parameters

-help	Prints out the command usage.
body	Specifies the script of commands to execute during each iteration.
collection	Specifies the collection of objects through which to iterate.
var_name	Specifies the iterator variable. During each iteration, <i>var_name</i> is set to a collection of exactly one object. Any command that accepts collections can accept <i>var_name</i> as a value.

Examples

- The following command prints out the hierarchical names of all the cells in a design:

```
foreach_in_collection iCell [get_cells *] {  
  puts "Cell = [get_property $iCell hierarchical_name]"  
}  
Cell = ck_0  
Cell = ck_1  
Cell = ck_2  
Cell = ck_4
```

- The following example shows a more complex use of the `foreach_in_collection` command:

```
set cellCollection [get_cells templ_reg]  
set libCellCollection [get_lib_cells -of_objects $cellCollection]  
set libArc [get_lib_arcs -of_objects $libCellCollection]  
  
foreach_in_collection arc $libArc {  
  set fpin [get_property $arc from_lib_pin]
```

```
set tpin [get_property $arc to_lib_pin]
set sense [get_property $arc timing_type]

set from_pin_name [get_property $fpin name]
set to_pin_name [get_property $tpin name]

puts [format "%25s -> %25s %-20s" $from_pin_name $to_pin_name $sense]
}

CK -> D          setup_rising
CK -> D          hold_rising
CK -> CK         minimum_period
CK -> CK         minimum_period
CK -> CK         min_pulse_width

foreach_in_collection.txt
CK -> CK         min_pulse_width
RN -> RN         min_pulse_width
CK -> RN         recovery_rising
CK -> RN         removal_rising
CK -> Q          falling_edge
RN -> Q          clear
```

Related Commands

- [append_to_collection](#)
- [copy_collection](#)
- [range_collection](#)

get_activity

```
get_activity
[-help]
[-out_file filename]
[-net netname]
[-pin pinname]
[-port portname]
[-summary]
[-tcl_list]
[-list_of_nets_based_on_driver {primary_inputs | sequential | combinational | memory | ICG}]
[-list_of_nets_based_on_source_of_activity_info
{activity_file|set_switching_activity|propagated|default}]
[-report_average_switching_activity]
[-report_cell_group_activity_summary]
[-inst inst_name]
```

Determines the source of activity for the specified nets/pins/ports. The power analysis engine has various sources from where activities can be annotated from, such as switching activity specification (input/sequential/global/clock gate), clock definitions/constants through SDC/TWF, activity files (VCD/TCF/SAF), user defined activity and/or propagated values.

Parameters

-help	Outputs a brief description that includes the type and default information for each <code>get_activity</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man get_activity</code>
-inst <i>inst_name</i>	
	Specifies the top/hierarchy instance or the leaf level instance name for which average activity is to be reported.
-list_of_nets_based_on_driver {primary_inputs sequential combinational memory ICG}	

	Specifies to output the list of nets based on the specified net driver. You can specify one or more net drivers at a time, as shown below: <pre>get_activity -list_of_nets_based_on_driver primary_inputs combinational memory</pre> To specify multiple drivers, you can use / (means 'or') or & (means 'and') between two drivers, without a space.
	<pre>-list_of_nets_based_on_source_of_activity_info {activity_file set_switching_activity propagated default}</pre>
	Specifies to output the list of nets based on the specified activity source information.
<pre>-net netname</pre>	Specifies the name of the net. Note: You can use the <code>get_nets</code> command to determine the activity source for a collection of nets.
<pre>-out_file filename</pre>	Specifies the output file into which the activity sources are to be written. The format of the report is: <i><net_name/pin_name> <activity_source> <duty_cycle> <transition_density></i>
<pre>-pin pinname</pre>	Specifies the name of the pin. Note: You can use the <code>get_pins</code> command to determine the activity source for a collection of pins.
<pre>-port portname</pre>	Specifies the name of the port. Note: You can use the <code>get_ports</code> command to determine the activity source for a collection of ports.
	<pre>-report_average_switching_activity</pre>
	Specifies to report the average activity of the given instance/hierarchy/top-level.
	<pre>-report_cell_group_activity_summary</pre>
	Specifies to give a summary of cell group activity.

<code>-summary</code>	Generates a detailed activity annotation report of the specified nets, pins, and ports. This report contains the following information: • Primary Inputs • Sequential Outputs • Memory/Macro Outputs • Tristate Outputs Note: Use the <code>get_activity -summary</code> command to report activity annotation summary without printing information for nets/pins/ports.
<code>-tcl_list</code>	Produces the report in the Tcl list format instead of a tabular format. The <code>-tcl_list</code> and <code>-out_file</code> parameters are mutually exclusive; you cannot specify them together.

The activity report for pins is displayed in the following format:

```
<Pin Name> <Source of the Activity Value> <Duty Cycle> <Toggles/Sec>
```

The report fields are described below:

- **Pin Name:** Name of the specified pins.
- **Source of the Activity Value:** Source of activity for the specified nets, pins, or ports.
- **Duty Cycle:** Probability of signal at 1.
- **Toggles/Sec:** Number of toggles divided by the total simulation time.

Examples

- The following example returns the activity sources of all nets that match the specified pattern and writes the output information to a file named `nets.rpt`:

```
get_activity -net [get_nets n*] -out_file nets.rpt
```

The following is the example output of the `nets.rpt` file:

```
n_14 user_defined_activity 0.5 6e+07
n_11 user_defined_activity 0.5 6e+07
n_25 user_defined_activity 0.5 6e+07
n_13 user_defined_activity 0.5 6e+07
n_26 user_defined_activity 0.5 6e+07
n_9 user_defined_activity 0.5 6e+07
n_27 user_defined_activity 0.5 6e+07
n_23 user_defined_activity 0.5 6e+07
n_20 user_defined_activity 0.5 6e+07
n_16 user_defined_activity 0.5 6e+07
```

- The following example returns the activity source of the pin `i_4/A1` and writes the output information to a power report file named `pin.rpt`:

```
get_activity -pin i_4/A1 -out_file pin.rpt
```

- The following command report the average activity of all nets:

```
get_activity -report_average_switching_activity
```

The following is the example output:

```
Avg Switching activity of all nets 4.727e+17
```

- The following command gives a summary of cell group activity:

```
get_activity -report_cell_group_activity_summary
```

The following is the example output:

Group Activity Summary Report:

Source ->	activity file	set_switching_activity
propagated	default	Total
All nets	2	1
2	5	10
Break-up based on net driver:		
Primary Input	2 (40%)	0 (0%)
0 (0%)	3 (60%)	5
Sequential	0 (0%)	1 (33.33%)
0 (0%)	2 (66.67%)	3
Combinational	0 (0%)	0 (0%)
2 (100%)	0 (0%)	2
Memory	0 (0%)	0 (0%)
0 (0%)	0 (0%)	0

ICG	0 (0%)	0 (0%)
0 (0%)	0 (0%)	0
Black Box	0 (0%)	0 (0%)
0 (0%)	0 (0%)	0

- The following command gives the list of nets based on primary inputs:
`get_activity -list_of_nets_based_on_driver primary_inputs`
 The following is the example output:
`D2 D1 CP2 CP1 dummy0`
- The following command gives the list of nets based on primary inputs or sequential driver:
`get_activity -list_of_nets_based_on_driver primary_inputs|sequential`
 The following is the example output:
`Q2 Q1 D2 D1 CP2 CP1 n1 dummy0`
- The following command gives the list of nets based on primary inputs or sequential driver for the instance `ff1b`:
`get_activity -list_of_nets_based_on_driver primary_inputs|sequential -instance ff1b`
- The following command gives the list of nets based on the propagated source for the instance `i2`:
`get_activity -list_of_nets_based_on_source_of_activity_info propagated -instance i2`
- The following command gives a summary of cell group activity for the instance `i2`:
`get_activity -instance i2 -report_cell_group_activity_summary`

get_arcs

```
get_arcs
[-help]
{ [-to to_list] [-from from_list]
  | -of_objects object_list}
[-filter expr]
[-quiet]
```

Creates a collection of timing arcs. Assign these arcs to a variable, or pass them to another command. If no objects match the criteria, an empty collection is returned.

Note: The timing graph must be built before you can use this command. A warning message is issued indicating that the timing graph is not generated.

Parameters

-help	Prints out the command usage.
-filter <i>expr</i>	Filters a collection based on the specified expression. For any arcs that match the pattern, the software evaluates the expression based on the attribute of the arc. For details on how to create filter expressions, refer to the filter_collection command.
-from <i>from_list</i>	Adds all timing arcs that fan in directly to the specified pins or ports to the collection. You can specify a list of pins or a list of ports, but you cannot specify a list that contains both pins and ports. You can specify a pattern for the pin or port name, a collection of pins or ports, or a pattern and a collection. Note: You cannot specify this parameter with the <code>-of_objects</code> parameter.
-of_objects <i>object_list</i>	Adds all timing arcs that are associated with the specified cells or nets to the collection. You can specify a list of cells or a list of nets, but you cannot specify a list that contains both cells and nets. You can specify a pattern for the cell or net name, a collection of cells or nets, or a pattern and a collection. Note: You cannot specify this parameter with the <code>-to</code> or <code>-from</code> parameters.
-quiet	Suppresses all error and warning messages generated when the <code>get_arcs</code> command is run.

`-to to_list`

Adds all timing arcs that fan out directly from the specified list of pins or ports to the collection.

You can specify a list of pins or a list of ports, but you cannot specify a list that contains both pins and ports. You can specify a pattern for the pin or port name, a collection of pins or ports, or a pattern and a collection.

Note: You cannot specify this parameter with the `-of_objects` parameter.

Examples

- The following command returns a collection of the timing arcs fan in directly to the pin `dff1/CP`:

```
get_arcs -from dff1/CP
```
- The following command creates a collection of the timing arcs that are associated with the nets in the specified collection:

```
get_arcs -of_objects [get_nets {n1}]
```

get_cells

```
get_cells
[-help]
[-filter expr]
[-hierarchical]
[-hsc char]
[-leaf]
[-nocase]
[-quiet]
[-regexp]
[patterns | -of_objects object_list]
```

Creates a collection of instances in the current design whose name matches the supplied pattern list. Assign this collection to a variable or pass it as an argument in another command.

Parameters

-help	Prints out the command usage.
-filter <i>expr</i>	Filters the collection with the specified expression. For any cells that match the pattern, the software evaluates the expression based on the attribute of the cell. You can filter cells using any of the cell properties supported through the get_property command. For details on how to create filter expressions, refer to the filter_collection command.
-hierarchical	Specifies that the patterns should be matched hierarchically. If the flat name of an instance at a particular hierarchical level matches the patterns, it is included in the result. For example, if there is top level hierarchical instance <code>Top</code> and it contains another sub-instance called <code>FF1</code>, then the following command can be used to get the instance <code>Top/FF1</code> (since the given pattern will be matched with instance flat name <code>FF1</code>): <pre>get_cells -hier FF*</pre> However, the following command will display an error: <pre>get_cells -hier Top/FF*</pre>
-hsc <i>char</i>	Specifies the hierarchical delimiter for patterns. For example, if the hierarchical delimiter is <code>@</code>, the <code>sub/I1@I2</code> pattern matches instance <code>I2</code> within the hierarchy limited at <code>sub/I1</code>.

<code>-leaf</code>	Returns leaf cells only. When the <code>-leaf</code> parameter is not specified, the <code>get_cells</code> command returns the hierarchical instances present on a net along with the flat instances at the same hierarchical level as the specified object. Note: The <code>-leaf</code> parameter can only be specified with the <code>-of_objects</code> parameter.
<code>-nocase</code>	Specifies that pattern matching is not case sensitive. Note: You must specify <code>-regexp</code> in order to use this parameter.
<code>-of_objects</code> <i>object_list</i>	Creates a collection of all cells associated with the specified pins, nets, library cells, or design cells. You can specify a list of pins or a list of nets, but you cannot specify a list that contains both pins and nets. You can specify patterns for the pin or net names, a collection of pins or nets, or a combination of patterns and a collection. The <code>-of_objects</code> parameter supports <code>get_designs</code> and <code>get_lib_cells</code> as valid collection objects. The use model is as follows: <pre>get_cells -of_objects [get_designs object_list] get_cells -of_objects [get_lib_cells object_list]</pre>
<i>patterns</i>	Specifies patterns for instance names. Patterns include the <code>*</code> and <code>?</code> wildcard characters and collections of instances. The <code>get_cells</code> command returns a collection of instances that match the patterns. If no such instance is found, an empty collection is returned.
<code>-quiet</code>	Suppresses all error and warning messages generated when the <code>get_cells</code> command is run.

<code>-regexp</code>	Treats the specified patterns as a regular expression patterns. When this parameter is specified, the given patterns <code>start</code> and <code>end</code> are assumed to be matching with the start and end part of the complete object name. For example, the following can be used to retrieve the hierarchical instance <code>Top/block1/block2/FF1</code>: <pre>get_cells Top/*/*/FF1 get_cells -regexp Top/.*/FF1</pre> However, the following command will display an error : <pre>get_cells Top/*/FF1</pre> If this parameter is specified with <code>-hier</code> parameter, the given pattern will be matched with the complete hierarchical name of objects instead of only the flat name and all the successful matches are included in the result. For example, if there is a top level hierarchical instance <code>Top</code> and it contains another sub-instance called <code>FF1</code>, then either of these can be used to retrieve <code>Top/FF1</code> instance: <pre>get_cells -hier FF1 get_cells -hier -regexp Top/FF1</pre> However, the following commands will display an error : <pre>get_cells -hier Top/FF1 get_cells -hier -regexp FF1</pre>
----------------------	--

Examples

- The following command searches for pins within the hierarchy limited at `B`:

```
get_cells -hsc @ B@*
```
- The following command searches for cells with set pattern and filter:

```
get_cells "o*" -filter "@ref_lib_cell_name != FD2 && @is_black_box==false"
```

Related Commands

- `get_libs`
- `get_lib_cells`
- `get_lib_pins`
- `get_pins`

get_clocks

```
get_clocks
[-help]
[-filter expr]
[-regexp]
[-nocase]
[-quiet]
[patterns]
```

Creates a collection of clocks whose name matches the supplied pattern list. Assign this collection to a variable or pass it as an argument to another command.

The `get_clocks` command reports all clocks, including inactive clocks.

Parameters

<code>-help</code>	Prints out the command usage.
<code>-filter <i>expr</i></code>	Filters the collection with the specified expression. For any clocks that match the pattern, the software evaluates the expression based on the attribute of the clock. You can filter clocks using any of the clock properties supported through the get_property command. For details on how to create filter expressions, refer to the filter_collection command.
<code>-nocase</code>	Specifies that pattern matching is not case sensitive. Note: You must specify <code>-regexp</code> in order to use this parameter.
<code><i>patterns</i></code>	Specifies a pattern (or a list of patterns) for clock names. A pattern can contain * and ? wildcard characters, or a collection of instances and clocks. Note: If a pattern is not specified, then <code>get_clocks</code> returns all the clocks that meet other filters.
<code>-quiet</code>	Suppresses all error and warning messages generated when the <code>get_clocks</code> command is run.
<code>-regexp</code>	Treats the specified patterns as a regular expression patterns. <i>Default:</i> Treats the specified pattern as a wild card

Examples

- The following example returns all clocks beginning with the name `CK`:
`get_clocks CK*`
- The following example returns a collection of all clocks beginning with the name `CK` and `Clk`:
`get_clocks [list CK* Clk* ]`
- The following example returns a collection of all active clocks beginning with the name `CK`:
`get_clocks CK* -filter {is_active == true}`
- The following command returns all the clocks that are propagated:
`get_clocks -filter "is_propagated_clock == true"`

Related Commands

- `all_clocks`
- `create_clock`
- `get_pins`
- `get_ports`
- `report_clocks`

get_designs

get_designs
[-help]
[-quiet]
patterns

Creates a collection of modules and assigns this collection to a variable or pass it as an argument to another command. The software uses this information during timing analysis.

Parameters

-help	Prints out the command usage.
<i>patterns</i>	Specifies patterns for module names. Patterns include the * and ? wildcard characters and collections of modules. The <code>get_designs</code> command returns a collection of modules that match the patterns. If no such module is found, an empty collection is returned.
-quiet	Suppresses all error and warning messages generated when the <code>get_design</code> command is run.

Examples

- The following command returns a complete list of modules:

```
get_designs *
```

get_generated_clocks

```
get_generated_clocks  
[-help]  
[-filter expr]  
[-regexp | -exact]  
[-nocase]  
[patterns]
```

Creates a collection of generated clocks whose name matches the supplied pattern list. Assign this collection to a variable, or pass it as an argument to another command.

Parameters

-help	Prints out the command usage.
-exact	Performs exact pattern matching against the object name, instead of wild card or regular expression matching. Use this parameter when the object name includes special characters such as *, ?, and +. Note: If you specify this parameter, you cannot specify <code>-regexp</code> .
-filter expr	Filters the collection with the specified expression. For any clocks that match the pattern, the software evaluates the expression based on the attribute of the clock.
-nocase	Specifies that pattern matching is not case sensitive.
patterns	Specifies patterns for generated clock names. Patterns include the * and ? wildcard characters, and collections of generated clocks.
-regexp	Treats the specified pattern as a regular expression. <i>Default:</i> Treats the specified pattern as a wild card Note: If you specify this parameter, you cannot specify <code>-exact</code> .

Examples

- The following command returns the collection of all the generated clocks present in the design whose name starts with "CK":

```
tempus> get_generated_clocks CK*
```

```
CKGEN1 CKGEN2 CKGEN3
```

Related Commands

- `create_generated_clock`

get_lib_arcs

```
get_lib_arcs
{ [-to to_lib_pins] [-from from_lib_pins]
  | -of_objects {lib_cell_list | timing_arcs} }
[-filter expr]
[-quiet]
```

Creates a collection of library timing arcs. Assign these library timing arcs to a variable, or pass them to another command. If no objects match the criteria, an empty collection is returned.

Parameters

<code>-filter expr</code>	Filters the collection with the specified expression. For any library arcs that match the pattern, the software evaluates the expression based on the attribute of the library arc. For details on how to create filter expressions, refer to the filter_collection command.
<code>-from from_lib_pins</code>	Creates a collection of all library arcs that originate from the specified library pins. You can specify a pattern for the pin name, a collection of pins, or a pattern and a collection. If you specify this parameter with the <code>-to</code> parameter, the software creates a collection of all library arcs that exist between the "to" and "from" library pins. Note: You cannot specify this parameter with the <code>-of_objects</code> parameter.
<code>-of_objects {lib_cell_list timing_arcs}</code>	Creates a collection of all library arcs that are associated with the specified library cells or timing arcs. You can specify a list of library cells or a list of timing arcs, but you cannot specify a list that contains both library cells and timing arcs. You can specify a pattern for the library cell or timing arc name, a collection of library cells or timing arcs, or a pattern and a collection. Note: You cannot specify this parameter with the <code>-to</code> or <code>-from</code> parameters.
<code>-quiet</code>	Suppresses all error and warning messages generated when the <code>get_lib_arcs</code> command is run.

`-to`
`to_lib_pins`

Creates a collection of all library arcs that terminate at the specified library pins. You can specify a pattern for the pin name, a collection of pins, or a pattern and a collection.

If you specify this parameter with the `-from` parameter, the software creates a collection of all library arcs that exist between the "to" and "from" library pins.

Note: You cannot specify this parameter with the `-of_objects` parameter.

Examples

- The following command reports the timing type off all the timing arcs of the flop 'DFF':

```
tempus> get_property [get_lib_arcs -of_objects DFF] timing_type
```

Sample output:

```
minimum_period minimum_period min_pulse_width min_pulse_width setup_rising hold_rising  
rising_edge rising_edge
```

Related Commands

- `report_lib_arcs`
- `get_lib_cells`
- `get_lib_pg_pins`
- `get_lib_pins`
- `get_libs`

get_lib_cells

```
get_lib_cells
[-help]
[-filter expr]
[-regexp]
[-nocase]
[-quiet]
{pattern_list | -of_objects object_list}
```

Creates a collection of library cells from the loaded libraries whose name matches the supplied pattern list. Assign these library cells to a variable or pass them to another command. If no objects match the criteria, an empty collection is returned.

Parameters

-help	Prints out the command usage.
-filter <i>expr</i>	Filters the collection with the specified expression. For any library cells that match the pattern, the software evaluates the expression based on the attribute of the library cell. You can filter library cells using any of the library cell properties supported through the get_property command. For details on how to create filter expressions, refer to the filter_collection command.
-nocase	Specifies that pattern matching is not case sensitive. Note: You must specify <code>-regexp</code> in order to use this parameter.
-of_objects <i>object_list</i>	Creates a collection of all library cells associated with the specified library pins or cells or libs. You can specify a list of library pins or a list of cells or a list of libs, but you cannot specify a list that contains mixed of library pins and cells and libs. You can specify patterns for the library pin or cell or lib names, a collection of library pins or cells or libs, or a combination of patterns and a collection.

<code>pattern_list</code>	Returns only those libraries in the collection whose name matches one or more of the patterns specified in the <code>pattern_list</code> argument. The characters <code>?</code> and <code>*</code> are wild cards. The <code>?</code> character matches any one character while the <code>*</code> character matches zero or more characters. If a library matches multiple patterns, it appears multiple times in the collection. A pattern can have only one hierarchical separator character. The left part of the pattern is the library name pattern and the right part is the cell name pattern. If there is no separator character, the pattern is compared to cell names in all the libraries. A pattern can have only one hierarchical separator character, dividing the pattern into one or two parts. If the hierarchical separator is <code>/</code>, the alternatives are: • <code>cell_name_pattern</code> Selects all cells whose name matches the <code>cell_name_pattern</code> from all libraries. • <code>lib_name_pattern/cell_name_pattern</code> Selects all cells whose name matches the <code>cell_name_pattern</code> from all libraries whose name matches the <code>lib_name_pattern</code>.
<code>-quiet</code>	Suppresses all error and warning messages generated when the <code>get_lib_cells</code> command is run.
<code>-regexp</code>	Treats the specified patterns as regular expression patterns. <i>Default:</i> Treats the specified pattern as wild card

Examples

- The following command prints all cells for all libraries:
`get_lib_cells *`
- The following command prints a collection with all cells in the `lca500kv` lib library:
`get_lib_cells lca500kv/*`
- The following command prints a collection with all cells whose names starts with `AN` in all libraries starting with `lca`:
`get_lib_cells lca*/AN*`
- The following command disables delay arcs on the `EF11L050032A` library cell. The `set_disable_cell_timing` command effects all instantiations of the specified cell, and lets you disable delay arcs from and to internal pins.
`set_disable_timing -from WACLK -to RBO1 [get_lib_cells {EF11L050032A}]`

Related Commands

- `get_lib_arcs`
- `get_lib_pg_pins`
- `get_lib_pins`
- `get_libs`
- `get_property`

get_lib_pg_pins

```
get_lib_pg_pins
[-help]
[-filter expr]
{-of_objects object_list}
```

Returns a collection of library-level PG pins from the loaded libraries. An empty collection is returned if no PG pin definitions are found in the loaded library.

Parameters

-help	Prints out the command usage.
-filter <i>expr</i>	Filters the collection with the specified expression. For any library pg pins that match the specified expression, the software evaluates the expression based on the attribute of the library pg pin. You can filter library pg pins along with the <code>-of_objects</code> parameter - using the library pg pin properties of <code>lib_pg_pin</code> object type (supported through the get_property command). For details on how to create filter expressions, refer to the filter_collection command.
-of_objects <i>object_list</i>	Creates a collection of all library PG pins associated with the specified library cells. The <code>-of_objects</code> parameter supports <code>get_lib_cells</code> as valid objects. For example, <pre>get_lib_pg_pins -of_objects [get_lib_cells sc9_cmos32lp/DFFQ_X1M] VDD VSS get_lib_pg_pins *</pre> **ERROR: (TCLCMD-1420): Currently only -of_objects option is supported

Examples

- The following command gets the collection of all the library-level pg pins of the specified library cell:
tempus > get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/A022X]
- The following command filters the collection of all library-level pg pins of the library cell to return only the library pg pins containing the string name defined with the `lib_pg_pin` name attribute:

```
tempus > get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/A022X] -filter "name =~  
*VDD*"
```

Related Commands

- `get_lib_cells`
- `get_lib_pins`
- `get_libs`
- `get_property`

get_lib_pins

```
get_lib_pins
[-help]
[-filter expr]
[-regexp]
[-nocase]
[-quiet]
{pattern_list | -of_objects object_list}
```

Creates a collection of library cell pins from the loaded libraries whose name matches the supplied pattern list. Assign these library cell pins to a variable or pass them to another command. If no objects match the criteria, an empty collection is returned.

Parameters

-help	Prints out the command usage.
-filter <i>expr</i>	Filters the collection with the specified expression. For any library cell pins that match the pattern, the software evaluates the expression based on the attribute of the library cell pin. You can filter library pins using any of the library pin properties supported through the get_property command. For details on how to create filter expressions, refer to the filter_collection command.
-nocase	Specifies that pattern matching is not case sensitive. Note: You must specify <code>-regexp</code> in order to use this parameter.
-of_objects <i>object_list</i>	Creates a collection of all library pins associated with the specified library cells or pins. You can specify a list of cells or a list of pins, but you cannot specify a list that contains both cells and pins. You can specify patterns for the cell or pin names, a collection of cells or pins, or a combination of patterns and a collection.

<i>pattern_list</i>	Returns only those libraries in the collection whose name matches one or more of the patterns specified in the <i>pattern_list</i> argument. The characters <code>?</code> and <code>*</code> are wild cards; The <code>?</code> character matches any one character while the <code>*</code> character matches zero or more characters. If a library cell matches multiple patterns, it appears multiple times in the collection. A pattern can have only two hierarchical separator characters, dividing the pattern into one, two, or three parts. If the hierarchical separator is <code>/</code>, the alternatives are: • <i>pin_name_pattern</i> Selects all pins whose name matches the <i>pin_name_pattern</i> from all cells in the libraries. • <i>cell_name_pattern/pin_name_pattern</i> Selects all pins whose name matches the <i>pin_name_pattern</i> from all cells whose name matches the <i>cell_name_pattern</i> in all libraries. • <i>lib_name_pattern/cell_name_pattern/pin_name_pattern</i> Select all pins whose name matches the <i>pin_name_pattern</i> from all cells whose name matches the <i>cell_name_pattern</i> from all libraries whose name matches the <i>lib_name_pattern</i>.
<code>-quiet</code>	Suppresses all error and warning messages generated when the <code>get_lib_pins</code> command is run.
<code>-regexp</code>	Treats the specified patterns as a regular expression patterns. <i>Default:</i> Treats the specified pattern as a wild card

Examples

- The following command returns all pins in all cells for all libraries:
`get_lib_pins *`
- The following command returns a collection with all pins for cell `A01` in any library:
`get_lib_pins A01/*`
- The following command returns a collection with all pins whose name starts with `Z` or `Q` for the `A01` cell in any library:
`get_lib_pins {A01/Z* A01/Q*}`
- The following command returns a collection with all pins for the `A01` cell in the `lca500kv` lib library:
`get_lib_pins lca500kv/A01/*`
- The following command returns a collection with all pins starting with `Z` in all cells whose names

starts with `AN` in all libraries starting with `lca`:

```
get_lib_pins lca*/AN*/Z*
```

Related Commands

- `get_lib_cells`
- `get_lib_pg_pins`
- `get_libs`
- `get_property`

get_libs

```
get_libs
[-help]
[-filter expr]
[-regexp]
[-nocase]
[-quiet]
{-of_objects object_list | pattern_list}
```

Creates a collection of loaded libraries whose name matches those specified in the pattern list. Assign these libraries to a variable or pass them to another command. If no objects match the criteria, an empty collection is returned.

Parameters

-help	Prints out the command usage.
-filter <i>expr</i>	Filters the collection with the specified expression. For any libraries that match the pattern, the software evaluates the expression based on the attribute of the library. You can filter libraries using any of the library properties supported through the get_property command. For details on how to create filter expressions, refer to the filter_collection command.
-nocase	Specifies that pattern matching is not case sensitive. Note: You must specify <code>-regexp</code> in order to use this parameter.
-of_objects <i>object_list</i>	Creates a collection of libraries that belong to the library cells in a given object list.
<i>pattern_list</i>	Returns only those libraries in the collection whose name matches one or more of the patterns specified in the <i>pattern_list</i> argument. The characters <code>?</code> and <code>*</code> are wild cards; The <code>?</code> character matches any one character while the <code>*</code> character matches zero or more characters. If a library matches multiple patterns, it appears multiple times in the collection.
-regexp	Treats the specified patterns as a regular expression patterns. <i>Default:</i> Treats the specified pattern as a wild card

`-quiet`

Suppresses all error and warning messages generated when the `get_lib_cells` command is run.

Examples

- The following command displays a list of loaded libraries starting with a or l:

```
get_libs {a* l*}
```

- The following command queries all libraries beginning with the letter l:

```
get_libs l*
```

- The following command creates a collection of libraries that are associated with the library cells in the specified object list:

```
get_libs -of_objects [get_lib_cells *]
```

Related Commands

- `get_lib_cells`
- `get_lib_pg_pins`
- `get_lib_pins`
- `get_property`

get_nets

```
get_nets
[-help]
[-hierarchical]
[-hsc char]
[-filter expr]
[-regexp]
[-nocase]
[-quiet]
[patterns | -of_objects object_list]
```

Creates a collection of nets in the current design whose name matches the supplied pattern list. You can assign this collection to a variable or pass it as an argument to an another command. If no such net is found, an empty collection is returned.

When you use the `get_nets` command to specify hierarchical nets, the software matches the specified pattern and returns the top level net connected to it.

Parameters

-help	Prints out the command usage.
-filter <i>expr</i>	Filters the collection with the specified expression. For any nets that match the pattern, the software evaluates the expression based on the attribute of the net. You can filter nets using any of the net properties supported through the <code>get_property</code> command. For details on how to create filter expressions, refer to the <code>filter_collection</code> command.
-hierarchical	Specifies that the patterns should match hierarchically. If the hierarchical name of a net at any hierarchical level matches the patterns, it is included in the result.
-hsc <i>char</i>	Specifies the hierarchical delimiter for patterns.
-nocase	Specifies that pattern matching is not case sensitive. Note: You must specify <code>-regexp</code> in order to use this parameter.

<code>-of_objects</code> <code>object_list</code>	Creates a collection of all nets associated with the specified cells, pins, or ports. You can specify a list of cells, a list of pins, or a list of ports, but you cannot specify a list that contains cells, pins, and ports together. You can specify patterns for the cell, pin, or port names, a collection of cells, pins, or ports, or a combination of patterns and a collection.
<code>patterns</code>	Specifies patterns for net names. Patterns include the * and ? wildcard characters and collections of nets.
<code>-quiet</code>	Suppresses all error and warning messages generated when the <code>get_nets</code> command is run.
<code>-regexp</code>	Treats the specified patterns as regular expression patterns. <i>Default:</i> Treats the specified pattern as wildcard

Examples

- The following command returns all nets within the hierarchy limited at A:

```
get_nets -hsc @ A@*
```
- The following command returns all patterns that match hierarchy and identifies nets to be excluded from optimization:

```
get_nets * -hierarchical -filter "@dont_touch== true"
```

Related Commands

- `get_pins`

get_object_name

get_object_name
[-help]
collection

Returns the name of the object(s) contained in the specified collections.

By default, the command hides escape characters in the output. To enable printing of escape characters in the output, you can set `timing_enable_get_obj_escaped_name_backward_compatible` attribute to `true`.

Parameters

<code>-help</code>	Prints out the command usage.
<i>collection</i>	Specifies multiple collections that contain objects.

Examples

- The following command returns a tcl list of names, which can match the collection inputs:
`get_object_name [get_cells and*]`
- The following command defines a variable called `endpoint_list` to store endpoints with the ten worst slacks:

```
set endpoint_list [get_object_name [get_property \  
[report_timing -collection -max_points 10] capturing_point]]
```

Related Commands

- `query_objects`

get_path_groups

```
get_path_groups  
[-help]  
[-regexp]  
[-nocase]  
patterns
```

Creates a collection of path groups whose name matches those specified in the pattern list. Assign these path groups to a variable, or pass them to another command. If no objects match the criteria, an empty collection is returned.

Parameters

-help	Prints out the command usage.
-nocase	Specifies that pattern matching is not case sensitive.
patterns	Creates a collection of path groups whose name matches one or more of the specified patterns. Patterns include the * and ? wildcard characters and collections of path groups. If a path group matches multiple patterns, it appears multiple times in the collection.
-regexp	Treats the specified patterns as regular expression patterns. <i>Default:</i> Treats the specified pattern as wildcard

Examples

- The following command returns a collection of all the path groups present in the design:

```
tempus> get_path_groups *
```

Sample output:

```
reg2reg reg2gate
```

Related Commands

- [group_path](#)
- [reset_path_group](#)
- [report_path_groups](#)

get_pg_nets

```
get_pg_nets
[-help]
[-filter expr]
[-of_objects object_list]
```

Creates a collection of netlist-level instance PG nets of leaf cells/pins in the current design. An empty collection is returned if no PG net definitions/connections are found in the design netlist.

Parameters

- help	Prints out the command usage.
-filter <i>expr</i>	Specifies the filters for the collection with the specified expression. For any pg nets that match the pattern, the software evaluates the expression based on the attribute of the net. You can filter pg nets along with the <code>-of_objects</code> parameter - using any of the pg net properties of object type <code>pg_net</code> (supported through the <code>get_property</code> command). For details on how to create filter expressions, refer to the <code>filter_collection</code> command.
-of_objects <i>object_list</i>	Creates a collection of all the PG nets, or PG nets associated with the specified cells or PG pins. You can specify a list of cells or a list of pg pins, but you cannot specify a list that contains cells and pg pins together. The <code>-of_objects</code> parameter supports <code>get_cells</code> and <code>get_pg_pins</code> as valid objects.

Examples

- The following command filters the collection of all pg nets of the cell instance object to return only the pg nets containing the string name defined with the `pg_net` `hierarchical_name` attribute:
tempus > `get_pg_nets -of_objects [get_cells iA/out_reg] -filter "hierarchical_name =~ *VDD*"`
- The following command gets the collection of all pg nets of the cell instance object:

```
tempus > get_pg_nets -of_objects [get_cells iA/out_reg]
```

- The following command gets the collection of all pg nets of the pg_pins of the cell instance object:

```
tempus > get_pg_nets -of_objects [get_pg_pins -of_objects [get_cells iA/out_reg]]
```

Related Commands

- `get_property`
- `get_nets`

get_pg_pins

```
get_pg_pins
[-help]
[-filter expr]
[-of_objects object_list]
```

Returns a collection of netlist-level instance PG pins in the current design. An empty collection is returned if no PG pin definitions are found in the design netlist.

Parameters

- help	Prints out the command usage.
-filter <i>expr</i>	Specifies the filters for the collection with the given expression. For any pg pins that match the pattern, the software evaluates the expression based on the attribute of the pin. You can filter pg pins along with the <code>-of_objects</code> parameter - using the pg pin properties of object type <code>pg_pin</code> (supported through the get_property command). For details on how to create filter expressions, refer to the filter_collection command.
-of_objects <i>object_list</i>	Specifies the collection of all the pins associated with the specified cells or nets. The <code>-of_objects</code> parameter supports <code>get_cells</code> as valid objects. For example: <pre>get_pg_pins -of_objects [get_cells iA/out_reg] iA/out_reg/VSS iA/out_reg/VDD get_pg_pins iA/out_reg/VDD</pre> **ERROR: (TCLCMD-1420): Currently only -of_objects option is supported.

Examples

- The following command filters the collection of all the `pg_pins` of the cell instance object to return only the pg pins containing the string name defined with the `pg_pin hierarchical_name` attribute:

```
tempus > get_pg_pins -of_objects [get_cells iA/out_reg] -filter "hierarchical_name =~
*VDD*"
```

- The following command gets the collection of all pg pins of the cell instance object:

```
tempus > get_pg_pins -of_objects [get_cells iA/out_reg]
```

Related Commands

- `get_property`
- `get_pg_nets`

get_pins

```
get_pins
[-help]
[-hierarchical]
[-hsc char]
[-filter expr]
[-leaf]
[-regexp]
[-nocase]
[-quiet]
{patterns | -of_objects object_list}
```

Creates a collection of instance pins whose name matches the supplied pattern list. Assign this collection to a variable or pass it as an argument to another command. If no such pin is found, an empty collection is returned.

Parameters

-help	Prints out the command usage.
-filter <i>expr</i>	Filters the collection with the specified expression. For any pins that match the pattern, the software evaluates the expression based on the attribute of the pin. If the expression is set to true, the pin is included in the result. You can filter pins using any of the pin properties supported through the get_property command. For details on how to create filter expressions, refer to the filter_collection command.
- hierarchical	Specifies that patterns should match hierarchically. If the hierarchical name of a pin at any hierarchical level matches the patterns, it is included in the result.
-hsc <i>char</i>	Specifies the hierarchical delimiter for patterns.
-leaf	Returns leaf pins only. When the -leaf parameter is not used, the <code>get_pins</code> command returns the hierarchical pins present on a net along with the flat pins at the same hierarchical level as the specified object.
-nocase	Specifies that pattern matching is not case sensitive. Note: You must specify the -regexp parameter in order to use this parameter.

<code>-of_objects</code> <i>object_list</i>	Creates a collection of all pins associated with the specified cells or nets. You can specify a list of cells or a list of nets, but you cannot specify a list that contains both cells and nets. You can specify patterns for the cell or net names, a collection of cells or nets, or a combination of patterns and a collection.
<i>patterns</i>	Specifies patterns for pin names. Patterns include the * and ? wildcard characters and collections of pins.
<code>-quiet</code>	Suppresses all error and warning messages generated when the <code>get_pins</code> command is run.
<code>-regexp</code>	Treats the specified patterns as regular expression patterns. <i>Default:</i> Treats the specified pattern as wildcard.

Examples

- The following command returns all instance pins within the hierarchy limited at A:

```
get_pins -hsc @ A@*
```

- The following command filters the collection for `pin_direction` pin attribute:

```
get_pins "in*" -filter "@pin_direction == in"
```

Related Commands

- `create_clock`
- `get_cells`
- `get_ports`

get_ports

```
get_ports
[-help]
[-filter expr]
[-regexp]
[-nocase]
[-quiet]
[patterns | -of_objects object_list]
```

Creates a collection of ports whose name matches the supplied pattern list. Assign this collection to a variable or pass it as an argument to another command.

Note: The `get_ports` command always creates a collection of top level ports irrespective of the current instance set using the `current_instance` command.

Parameters

<code>-help</code>	Prints out the command usage.
<code>-filter</code> <i>expr</i>	Filters the collection with the specified expression. For any ports that match the pattern, the software evaluates the expression based on the attribute of the port. If the expression is set to true, the port is included in the result. You can filter ports using any of the port properties supported through the <code>get_property</code> command. For details on how to create filter expressions, refer to the <code>filter_collection</code> command.
<code>-nocase</code>	Specifies that pattern matching is not case sensitive. Note: You must specify <code>-regexp</code> in order to use this parameter.
<code>-of_objects</code> <i>object_list</i>	Creates a collection of all ports associated with the specified nets. You can specify patterns for the net names, a collection of nets, or a combination of patterns and a collection.
<i>patterns</i>	Specifies patterns for port names. Patterns include the <code>*</code> and <code>?</code> wildcard characters and collections of ports. The command returns a collection of ports that match the patterns. If no such port is found, an empty collection is returned.
<code>-quiet</code>	Suppresses all error and warning messages generated when the <code>get_ports</code> command is run.

`-regex`

Treats the specified patterns as regular expression patterns.
Default: Treats the specified pattern as wildcard.

Example

- The following example returns all ports beginning with the name `inb`:

```
get_ports inb*
```
- The following command filters the collection for `port_direction` port attribute:

```
get_ports "mode*" -filter {port_direction == in}
```

Related Commands

- `all_inputs`
- `all_outputs`
- `get_clocks`
- `get_pins`

get_power

```
get_power
[-help]
[-out_file filename]
[-nets nets_list | -pins pins_list | -insts instances_list]
[-attribute attributes_list]
[-include_unit]
[-tcl_list ]
[-pg_net {pg_net_name_list | all}]
```

Queries various power related properties of design objects like nets, pins, and instances. Using this command, you can retrieve power attributes, such as internal power, switching power, leakage power, total power, and toggle rate. This command is very useful for writing custom scripts.

Note: This command outputs toggle rates as N.A. if the clock domain information for a given net/pin/instance is not found.

Use this command after running the `report_power` or `restore_power_database` command.

Note: The `-nets`, `-pins`, and `-insts` parameters are mutually exclusive. You must specify only one of the parameters.

Parameters

<code>-attribute attributes_list</code>	Specifies a list of power attributes. If an attribute is not available for the specified design object, the software returns its value as NA. See List of Power Attributes for a mapping of the list of available attributes with the design objects. This is a required parameter.
<code>-help</code>	Outputs a brief description that includes the type and default information for each <code>get_power</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man get_power</code>
<code>-include_unit</code>	Specifies to include the units for the power attributes.
<code>-insts instances_list</code>	Specifies a list of instance names. The <code>-nets</code> , <code>-pins</code> , and <code>-insts</code> parameters are mutually exclusive. You must specify one, and only one, of the parameters. Note: You can use the <code>get_cells</code> command to determine the power attributes for a collection of instances.

<code>-nets <i>nets_list</i></code>	Specifies a list of net names. The <code>-nets</code>, <code>-pins</code>, and <code>-insts</code> parameters are mutually exclusive. You must specify one, and only one, of the parameters. Note: You can use the <code>get_nets</code> command to determine the power attributes for a collection of nets.
<code>-out_file <i>filename</i></code>	Specifies the output file into which the power related properties are to be written. The <code>-tcl_list</code> and <code>-out_file</code> parameters are mutually exclusive; you cannot specify them together.
<code>-pg_net {<i>pg_net_name_list</i> all}</code>	
	Specifies to query various power-related properties of a specified power net for an instance. This parameter supports the argument <code>all</code> to query properties of all power nets connected to the instance. You must use the <code>-insts</code> parameter in conjunction with the <code>-pg_net</code> parameter. The <code>-pg_net</code> parameter supports the following attributes: <code>switching_power</code>, <code>internal_power</code>, <code>leakage_power</code>, <code>total_power</code>, and <code>dynamic_power</code>.
<code>-pins <i>pins_list</i></code>	Specifies a list of pin names. The <code>-nets</code>, <code>-pins</code>, and <code>-insts</code> parameters are mutually exclusive. You must specify one, and only one, of the parameters. Note: You can use the <code>get_pins</code> command to determine the power attributes for a collection of pins.
<code>-tcl_list</code>	Produces the report in Tcl list format instead of a tabular format. The <code>-tcl_list</code> and <code>-out_file</code> parameters are mutually exclusive; you cannot specify them together.

The following power attributes can be queried for the design objects:

List of Power Attributes with Attribute Description

- `switching_power (net, inst)`: switching power of a net or instance
- `internal_power (inst)`: internal power of an instance
- `dynamic_power (inst)`: switching and internal power of an instance
- `leakage_power (inst)`: leakage power of an instance
- `total_power (inst)`: total power of an instance
- `toggle_rate (net, pin, inst)`: Toggle rate - Number of toggles in the specified VCD/TCF in the duration
- `duty_cycle (net, pin)`: Static probability of the signal to stay high
- `ref_clock (net, pin, inst)`: Reference clock name (Fastest clock for multi clock domains)
- `ref_clock_period (net, pin, inst)`: Reference clock period
- `transition_density (net, pin)`: $\text{toggle_rate} / \text{ref_clock_period}$ or $\text{toggle_rate} * \text{ref_clock_frequency}$
- `loading_cap (net, pin, inst)`: Loading capacitance
- `voltage (net, pin, inst)`: Operating voltage for a net or pin. For MSMV instance, this attribute can be used to get breakdown of domain specific power.
- `rise_slew (net, pin)`: Rise slew
- `fall_slew (net, pin)`: Fall slew
- `glitch_rate (net, pin)`: Glitch rate - Number of glitches per duration. Applies only to the vector-driven flow.
- `glitch_power (net, pin, inst)`: Glitch power. Applies only to the vector-driven flow.
- `activity_source (net, pin)`: Source of activity annotation. The options are: propagated, user_annotated, and constant.
- `pin_direction (pin)`: [input | output | inout]
- `cell_type (inst)`: Lists cell type as memory, standard cell, IO, sequential, and so on
- `all_attributes (net, pin, inst)`: Lists all related power attributes for the specified design object.

Examples

- The following command returns the specified power attributes for the net clock1:

```
get_power -nets clock1 -attribute {switching_power internal_power toggle_rate}
```

The following is the sample output:

```
clock1 0.04 NA 2
```

- The following command returns the specified power attributes for all nets that match the specified pattern master*:

```
get_power -nets [get_nets master*] -attribute {switching_power toggle_rate  
activity_source duty_cycle} -include_unit
```

The following is the sample output:

```
masterin[1] 0.001mW 0.2 user_annotated 0.5  
masterin[2] 0.002mW 0.2 user_annotated 0.5  
masterin[3] 0.003mW 0.1 propagated 0.5  
masterin[4] 0.005mW 1 constant 1
```

- The following command returns power-related properties of all power nets connected to the instance clk_buf_1:

```
get_power -pg_net all -insts clk_buf_1 -attribute {switching_power internal_power  
leakage_power}
```

The following is the sample output:

```
clk_buf_1 VDD 0.002 0.001 0.000001  
clk_buf_1 VDDL 0.0001 0.0001 0.0000001
```

get_property

```
get_property  
[-help]  
var_name  
property  
[-clock clock_name]  
[-view view_name]  
[-quiet]
```

Retrieves the attribute value for the specified object(s) property.

You can query the following:

- [Cell Properties](#)
- [Clock Properties](#)
- [Design Properties](#)
- [Library Properties](#)
- [Library Cell Properties](#)
- [Library Pin Properties](#)
- [Library PG Pin Properties](#)
- [Library Timing Arc Properties](#)
- [Net Properties](#)
- [PG Net Properties](#)
- [Path Group Properties](#)
- [Pin Properties](#)
- [PG Pin Properties](#)
- [Port Properties](#)
- [Timing Arc Properties](#)
- [Timing Path Properties](#)
- [Timing Point Properties](#)
- [si_victim Properties](#)
- [si_attacker Properties](#)
- [User-Defined Properties](#)

The `get_property` command supports DRV constraints (`set_min_fanout`, `set_max_fanout`,

`set_min_transition`, `set_max_transition`, `set_min_capacitance`, and `set_max_capacitance`) applied on library pins.

The `get_property` command does not work with partial property names. You are now required to specify the full name of the property.

Parameters

<code>-help</code>	Prints out the command usage.
<code>-clock</code> <i>clock_name</i>	Specifies the clock for which to query certain object properties.
<i>property</i>	Specifies the property for which to retrieve the attribute value.
<code>-quiet</code>	Suppresses all error and warning messages generated when the <code>get_property</code> command is run.
<i>var_name</i>	Specifies a pointer to a collection containing the object. Note: If the collection contains more than one object, the <code>get_property</code> command returns the property values for each object in the specified collection.
<code>-view</code> <i>view_name</i>	Specifies the analysis view in which to query the object attribute. You can query properties only for the following objects in an analysis view: library cells, library pins, ports, cells, pins, timing arcs, and nets. You can specify this parameter only when the software is in multi-mode multi-corner timing analysis mode. Note: The properties (described in the tables below), which are related to slack, delay, arrival, slew, transition, capacitance, uncertainty and latency, depend on the specified view. When the <code>-view</code> parameter is not specified, the maximum (or minimum) value for all the views is returned.

Cell Properties

<i>area</i>	Returns the area of the cell. If the cell is hierarchical, also includes the net area. <i>Return type:</i> float
-------------	---

clock_gating_integrated_cell	Returns the clock gating integrated cells present in a library. When specified, the software returns a value that is used to determine the integrated cell functionality to be used by clock gating tools. For example, <pre>get_property [get_cells <cell name>] clock_gating_integrated_cell</pre> <i>Return type:</i> string
early_cell_check_derate_factor	Returns the derating factor for early paths specified through the <code>set_timing_derate</code> command with the <code>-early</code> parameter. <i>Return type:</i> float
early_cell_check_mean_derate_factor	Returns the derating factor for early paths on the instance – when the <code>set_timing_derate -mean</code> parameter is specified. <i>Return type:</i> float
early_clock_check_incremental_derate_factor	Returns the early clock path instances' incremental derating factor specified through the <code>set_timing_derate -increment</code> parameter. <i>Return type:</i> float
early_data_check_incremental_derate_factor	Returns the early data path instance's incremental derating factor specified through the <code>set_timing_derate -increment</code> parameter. <i>Return type:</i> float
early_cell_check_sigma_derate_factor	Returns the derating factor for early paths on the instance - when the <code>set_timing_derate -sigma</code> parameter is specified. <i>Return type:</i> float
early_clk_cell_derate_factor	Returns the derating factor for early clock paths specified through the <code>set_timing_derate</code> command with the <code>-early</code> parameter. <i>Return type:</i> float

<code>early_clk_cell_mean_derate_factor</code>	Returns the derating factor for early clock paths – when the <code>set_timing_derate -mean</code> parameter is specified. <i>Return type:</i> float
<code>early_clk_cell_sigma_derate_factor</code>	Returns the derating factor for early clock paths – when the <code>set_timing_derate -sigma</code> parameter is specified. <i>Return type:</i> float
<code>early_data_cell_derate_factor</code>	Returns the derating factor for early paths specified through the <code>set_timing_derate</code> command with the <code>-early</code> parameter. <i>Return type:</i> float
<code>early_data_cell_mean_derate_factor</code>	Returns the derating factor for early paths – when the <code>set_timing_derate -mean</code> parameter is specified. <i>Return type:</i> float
<code>early_data_cell_sigma_derate_factor</code>	Returns the derating factor for early paths – when the <code>set_timing_derate -sigma</code> parameter is specified. <i>Return type:</i> float
<code>early_fall_cell_check_derate_factor</code>	Returns the early cell check derating factor specified through the <code>set_timing_derate</code> command with the <code>-fall</code> parameter. <i>Return type:</i> float
<code>early_fall_cell_check_mean_derate_factor</code>	Returns the early cell check derating factor – when the <code>set_timing_derate -cell_check</code> and <code>-mean</code> parameters are specified. <i>Return type:</i> float
<code>early_fall_cell_check_sigma_derate_factor</code>	Returns the early cell check derating factor – when the <code>set_timing_derate -cell_check</code> and <code>-sigma</code> parameters are specified. <i>Return type:</i> float

<code>early_fall_clk_cell_derate_factor</code>	Returns the early clock path derating factor specified through the <code>set_timing_derate</code> command with the <code>-fall</code> parameter. <i>Return type:</i> float
<code>early_fall_clk_cell_mean_derate_factor</code>	Returns the early clock path derating factor – when the <code>set_timing_derate</code> <code>-fall</code> and <code>-mean</code> parameters are specified. <i>Return type:</i> float
<code>early_fall_clk_cell_sigma_derate_factor</code>	Returns the early clock path derating factor – when the <code>set_timing_derate</code> <code>-fall</code> and <code>-sigma</code> parameters are specified. <i>Return type:</i> float
<code>early_fall_clock_incremental_derate_factor</code>	Returns the early clock path instances' incremental derating factor specified through the <code>set_timing_derate</code> <code>-increment</code> parameter - when the <code>-fall</code> parameter is specified. <i>Return type:</i> float
<code>early_fall_data_cell_derate_factor</code>	Returns the early data cell check derating factor – when the <code>set_timing_derate</code> <code>-fall</code> parameter is specified. <i>Return type:</i> float
<code>early_fall_data_cell_mean_derate_factor</code>	Returns the early data cell check derating factor – when the <code>set_timing_derate</code> <code>-fall</code> and <code>-mean</code> parameters are specified. <i>Return type:</i> float
<code>early_fall_data_cell_sigma_derate_factor</code>	Returns the early data cell check derating factor – when the <code>set_timing_derate</code> <code>-fall</code> and <code>-sigma</code> parameters are specified. <i>Return type:</i> float

<code>early_fall_data_incremental_derate_factor</code>	Returns the early data path instances' incremental derating factor specified through the <code>set_timing_derate -increment</code> parameter - when the <code>-fall</code> parameter is specified. <i>Return type:</i> float
<code>early_rise_cell_check_derate_factor</code>	Returns the early cell check derating factor specified through the <code>set_timing_derate</code> command with the <code>-rise</code> and <code>-cell_check</code> parameter. <i>Return type:</i> float
<code>early_rise_cell_check_mean_derate_factor</code>	Returns the early cell check derating factor – when the <code>set_timing_derate -rise</code> and <code>-mean</code> parameters are specified. <i>Return type:</i> float
<code>early_rise_cell_check_sigma_derate_factor</code>	Returns the early cell check derating factor – when the <code>set_timing_derate -rise</code> and <code>-sigma</code> parameters are specified. <i>Return type:</i> float
<code>early_rise_clk_cell_derate_factor</code>	Returns the early clock cell check derating factor specified through the <code>set_timing_derate</code> command with the <code>-rise</code> parameter. <i>Return type:</i> float
<code>early_rise_clk_cell_mean_derate_factor</code>	Returns the early clock cell check derating factor – when the <code>set_timing_derate -rise</code> and <code>-mean</code> parameters are specified. <i>Return type:</i> float
<code>early_rise_clk_cell_sigma_derate_factor</code>	Returns the early clock cell check derating factor – when the <code>set_timing_derate -rise</code> and <code>-sigma</code> parameters are specified. <i>Return type:</i> float

<code>early_rise_clock_incremental_derate_factor</code>	Returns the early clock path instances' incremental derating factor specified through the <code>set_timing_derate -increment</code> parameter - when the <code>-rise</code> parameter is specified. <i>Return type:</i> float
<code>early_rise_data_cell_derate_factor</code>	Returns the early data cell check derating factor specified through the <code>set_timing_derate</code> command with the <code>-rise</code> parameter. <i>Return type:</i> float
<code>early_rise_data_cell_mean_derate_factor</code>	Returns the early data cell check derating factor – when the <code>set_timing_derate -rise</code> and <code>-mean</code> parameters are specified. <i>Return type:</i> float
<code>early_rise_data_cell_sigma_derate_factor</code>	Returns the early data cell check derating factor – when the <code>set_timing_derate -rise</code> and <code>-sigma</code> parameters are specified. <i>Return type:</i> float
<code>early_rise_data_incremental_derate_factor</code>	Returns the early data path instances' incremental derating factor specified through the <code>set_timing_derate -increment</code> parameter - when the <code>-rise</code> parameter is specified. <i>Return type:</i> float
<code>has_sdc_assertions</code>	Returns a value of <code>true</code>, if the specified cell has SDC assertions applied on it. For example, <pre>get_property [get_cells <cell name>] has_sdc_assertions</pre> <i>Return Type:</i> Boolean
<code>hierarchical_level</code>	Returns the hierarchical level of the specified cell. For example, <pre>get_property [get_cell -hierarchical *] hierarchical_level</pre> <i>Return Type:</i> Integer

hierarchical_name	Returns the complete hierarchical name of the cell. <i>Return type:</i> string
instance_model	Reports the model type of an instance. The Instance model type can be ecsmn, ccsn, cdb, udn, or nldm. In case a noise model does not exist, the software returns 'NA'. For example, <pre>get_property [get_cells inst1/buf22] instance_model</pre> <i>Return type:</i> string
is_black_box	Returns a value of <code>true</code> if the cell is a black box cell. A cell is considered as a black box if the "function" definition of the cell is missing from the library. <i>Return type:</i> boolean
is_buffer	Returns a value of <code>true</code> if the associated library cell is recognized as a buffer cell. For example, <pre>get_property [get_cells mmu/IB1] is_buffer</pre> <i>Return type:</i> boolean
is_clock_gating_check	Returns a value of <code>true</code> if the cell is gated. <i>Return type:</i> boolean
is_clock_network_inst	Returns a value of <code>true</code> if a cell is part of the clock network. <i>Return type:</i> boolean
is_combinational	Returns a value of <code>true</code> if the cell is a combinational cell (not a sequential cell). <i>Return type:</i> boolean
is_disable_timing	Returns a value of <code>true</code> if the cell's timing has been disabled using the <code>set_disable_timing</code> command. <i>Return type:</i> boolean

<code>is_dont_touch</code>	Returns a value of <code>true</code> if the cell definition includes <code>dont_touch:true</code>. <i>Return type:</i> boolean
<code>is_fall_edge_triggered</code>	Returns a value of <code>true</code> if the cell is triggered by the falling edge of the clock. <i>Return type:</i> boolean
<code>is_hierarchical</code>	Returns a value of <code>false</code> if the cell is a leaf or library cell. <i>Return type:</i> boolean
<code>is_integrated_clock_gating_cell</code>	Returns a value of <code>true</code> if the cell is an integrated clock gating cell. <i>Return type:</i> boolean
<code>is_interface_timing</code>	Returns a value of <code>true</code> if a library cell has interface timing specified for that cell. <i>Return Type:</i> boolean
<code>is_macro_cell</code>	Returns a value of <code>true</code> if the cell is a macro cell. For example, <code>get_property [get_cells macro1] is_macro_cell</code> <i>Return type:</i> boolean
<code>is_memory_cell</code>	Returns a value of <code>true</code> if the cell is a memory cell. <i>Return type:</i> boolean
<code>is_msv</code>	Returns a value of <code>true</code> if the cell has multiple supply voltages. For example, <code>get_property [get_cells msv_cell] is_msv</code> <i>Return type:</i> boolean
<code>is_mux</code>	Returns a value of <code>true</code> if the cell is mux. For example, <code>get_property [get_cells TDSP_CORE_INST/PORT_BUS_MACH_INST/p11358A] is_mux</code> <i>Return type:</i> boolean

<code>is_negative_level_sensitive</code>	Returns a value of <code>true</code> if the cell is used as a negative level-sensitive sequential element, such as a negative level-sensitive latch. <i>Return type:</i> boolean
<code>is_pad_cell</code>	Returns a value of <code>true</code> if the Liberty library <code>is_pad_cell</code> attribute is set to <code>true</code> for this pad cell. <i>Return type:</i> boolean
<code>is_positive_level_sensitive</code>	Returns a value of <code>true</code> if the cell is used as a positive level-sensitive sequential element, such as a positive level-sensitive latch. <i>Return type:</i> boolean
<code>is_rise_edge_triggered</code>	Returns a value of <code>true</code> if the cell is triggered by the rising edge of the clock. <i>Return type:</i> boolean
<code>is_sequential</code>	Returns a value of <code>true</code> if the cell is a latch or flip-flop, or if the cell has sequential timing checks. <i>Return type:</i> boolean
<code>is_tristate</code>	Returns a value of <code>true</code> if the cell definition includes <code>three_state:true</code>. <i>Return type:</i> boolean
<code>is_unmapped</code>	Returns a value of <code>true</code> if the specified cell name does not have a defined library cell. For example, <pre>get_property [get_cells <cell name>] is_unmapped</pre> <i>Return Type:</i> boolean
<code>late_cell_check_derate_factor</code>	Returns the derating factor for late paths specified through the <code>set_timing_derate</code> command with the <code>-late</code> parameter. <i>Return type:</i> float

<code>late_cell_check_mean_derate_factor</code>	Returns the derating factor for late paths – when the <code>set_timing_derate -late</code> and <code>-mean</code> parameters are specified. <i>Return type:</i> float
<code>late_cell_check_sigma_derate_factor</code>	Returns the derating factor for late paths – when the <code>set_timing_derate -late</code> and <code>-sigma</code> parameters are specified. <i>Return type:</i> float
<code>late_clk_cell_derate_factor</code>	Returns the derating factor for late clock paths specified through the <code>set_timing_derate</code> command with the <code>-late</code> parameter. <i>Return type:</i> float
<code>late_clk_cell_mean_derate_factor</code>	Returns the derating factor for late clock paths – when the <code>set_timing_derate -late</code> and <code>-mean</code> parameters are specified. <i>Return type:</i> float
<code>late_clk_cell_sigma_derate_factor</code>	Returns the derating factor for late clock paths – when the <code>set_timing_derate -late</code> and <code>-sigma</code> parameters are specified. <i>Return type:</i> float
<code>late_clock_check_incremental_derate_factor</code>	Returns the late clock path instance's incremental derating factor specified through the <code>set_timing_derate -increment</code> parameter. <i>Return type:</i> float
<code>late_data_cell_derate_factor</code>	Returns the derating factor for late data paths specified through the <code>set_timing_derate</code> command with the <code>-late</code> parameter. <i>Return type:</i> float

<code>late_data_cell_mean_derate_factor</code>	Returns the derating factor for late data paths – when the <code>set_timing_derate -late</code> and <code>-mean</code> parameters are specified. For example, <pre>get_property [get_cells <cell name>] late_data_cell_mean_derate_factor</pre> <i>Return Type:</i> Float
<code>late_data_cell_sigma_derate_factor</code>	Returns the derating factor for late data paths – when the <code>set_timing_derate -late</code> and <code>-sigma</code> parameters are specified. <i>Return type:</i> float
<code>late_data_check_incremental_derate_factor</code>	Returns the late data path instances' incremental derating factor specified through the <code>set_timing_derate -increment</code> parameter. <i>Return type:</i> float
<code>late_fall_cell_check_derate_factor</code>	Returns the late cell check derating factor specified through the <code>set_timing_derate</code> command with the <code>-fall</code> parameter. <i>Return type:</i> float
<code>late_fall_cell_check_mean_derate_factor</code>	Returns the late cell check derating factor – when the <code>set_timing_derate -fall</code> and <code>-mean</code> parameters are specified. <i>Return type:</i> float
<code>late_fall_cell_check_sigma_derate_factor</code>	Returns the late cell check derating factor – when the <code>set_timing_derate -fall</code> and <code>-sigma</code> parameters are specified. <i>Return type:</i> float
<code>late_fall_clk_cell_derate_factor</code>	Returns the late clock cell check derating factor specified through the <code>set_timing_derate</code> command with the <code>-fall</code> parameter. <i>Return type:</i> float

<code>late_fall_clk_cell_mean_derate_factor</code>	Returns the late clock cell check derating factor – when the <code>set_timing_derate -fall</code> and <code>-mean</code> parameters are specified. <i>Return type:</i> float
<code>late_fall_clk_cell_sigma_derate_factor</code>	Returns the late clock cell check derating factor – when the <code>set_timing_derate -fall</code> and <code>-sigma</code> parameters are specified. <i>Return type:</i> float
<code>late_fall_clock_incremental_derate_factor</code>	Returns the late clock path instances' incremental derating factor specified through the <code>set_timing_derate -increment</code> parameter - when the <code>-fall</code> parameter is specified. <i>Return type:</i> float
<code>late_fall_data_cell_derate_factor</code>	Returns the late data cell check derating factor specified through the <code>set_timing_derate</code> command with the <code>-fall</code> parameter. <i>Return type:</i> float
<code>late_fall_data_cell_mean_derate_factor</code>	Returns the late data cell check derating factor – when the <code>set_timing_derate -fall</code> and <code>-mean</code> parameters are specified. <i>Return type:</i> float
<code>late_fall_data_cell_sigma_derate_factor</code>	Returns the late data cell check derating factor – when the <code>set_timing_derate -fall</code> and <code>-sigma</code> parameters are specified. <i>Return type:</i> float
<code>late_fall_data_incremental_derate_factor</code>	Returns the late data path instances' incremental derating factor specified through the <code>set_timing_derate -increment</code> parameter - when the <code>-fall</code> parameter is specified. <i>Return type:</i> float

<code>late_rise_cell_check_derate_factor</code>	Returns the late cell check derating factor specified through the <code>set_timing_derate</code> command with the <code>-rise</code> parameter. <i>Return type:</i> float
<code>late_rise_cell_check_mean_derate_factor</code>	Returns the late cell check derating factor – when the <code>set_timing_derate -rise</code> and <code>-mean</code> parameters are specified. <i>Return type:</i> float
<code>late_rise_cell_check_sigma_derate_factor</code>	Returns the late cell check derating factor – when the <code>set_timing_derate -rise</code> and <code>-sigma</code> parameters are specified. <i>Return type:</i> float
<code>late_rise_clk_cell_derate_factor</code>	Returns the late clock cell check derating factor specified through the <code>set_timing_derate</code> command with the <code>-rise</code> parameter. <i>Return type:</i> float
<code>late_rise_clk_cell_mean_derate_factor</code>	Returns the late clock cell check derating factor – when the <code>set_timing_derate -rise</code> and <code>-mean</code> parameters are specified. <i>Return type:</i> float
<code>late_rise_clk_cell_sigma_derate_factor</code>	Returns the late clock cell check derating factor – when the <code>set_timing_derate -rise</code> and <code>-sigma</code> parameters are specified. <i>Return type:</i> float
<code>late_rise_clock_incremental_derate_factor</code>	Returns the late clock path instances' incremental derating factor specified through the <code>set_timing_derate -increment</code> parameter - when the <code>-rise</code> parameter is specified. <i>Return type:</i> float

<code>late_rise_data_cell_derate_factor</code>	Returns the late data cell check derating factor specified through the <code>set_timing_derate</code> command with the <code>-rise</code> parameter. <i>Return type:</i> float
<code>late_rise_data_cell_mean_derate_factor</code>	Returns the late data cell check derating factor – when the <code>set_timing_derate -rise</code> and <code>-mean</code> parameters are specified. <i>Return type:</i> float
<code>late_rise_data_cell_sigma_derate_factor</code>	Returns the late data cell check derating factor – when the <code>set_timing_derate -rise</code> and <code>-sigma</code> parameters are specified. <i>Return type:</i> float
<code>late_rise_data_incremental_derate_factor</code>	Returns the late data path instances' incremental derating factor specified through the <code>set_timing_derate -increment</code> parameter - when the <code>-rise</code> parameter is specified. <i>Return type:</i> float
<code>lib_cell</code>	Returns a collection of all the library cell objects associated with the specified library pins/cells. For example, <pre>get_property [get_cells AAA] lib_cell -view VIEW1</pre> <i>Return type:</i> collection
<code>name</code>	Returns the leaf-level name of the cell. <i>Return type:</i> string
<code>object_type</code>	Returns the object type <code>cell</code>. <i>Return type:</i> string
<code>pin_count</code>	Returns the total number of signal pins. <i>Return type:</i> integer

<code>power_domain</code>	Returns the power domains of a cell. For example, <pre>get_property [get_cells FE_OCPC5_psw_en2] power_domain</pre> <i>Return type:</i> string
<code>ref_lib_cell_name</code>	Returns the name of reference module of the given cell. The reference module of the cell can be a Verilog module or a leaf library cell. <i>Return type:</i> string
<code>retention_cell</code>	Returns the value of the <code>retention_cell</code> attribute derived from Liberty. For example, <pre>get_property [get_cells retention_cell] retention_cell</pre> <i>Return type:</i> string
<code>timing_model_type</code>	Returns the model type for a given cell or instance. The supported values are <code>abstracted</code>, <code>extracted</code>, and <code>qtm</code>. <i>Return type:</i> string
<code>x_coordinate_max</code>	Returns the maximum x coordinate of the cell. <i>Return type:</i> float
<code>x_coordinate_min</code>	Returns the minimum x coordinate of the cell. <i>Return type:</i> float
<code>y_coordinate_max</code>	Returns the maximum y coordinate of the cell. <i>Return type:</i> float
<code>y_coordinate_min</code>	Returns the minimum y coordinate of the cell. <i>Return type:</i> float
<code>is_always_on</code>	Returns a value of <code>true</code> if a cell instance is an always-on cell. For example, <pre>get_property [get_cells mmu/U1] is_always_on</pre> <i>Return type:</i> boolean

<code>is_inverter</code>	Returns a value of <code>true</code> if a cell instance is an inverter cell. For example, <pre>get_property [get_cells mmu/INV1] is_inverter</pre> <i>Return type:</i> boolean
<code>is_isolation_cell</code>	Returns a value of <code>true</code> if a cell instance is an isolation cell. For example, <pre>get_property [get_cells mmu/U1] is_isolation_cell</pre> <i>Return type:</i> boolean
<code>is_level_shifter</code>	Returns a value of <code>true</code> if a cell instance is a level-shifter cell. For example, <pre>get_property [get_cells mmu/U1] is_level_shifter</pre> <i>Return type:</i> boolean
<code>is_power_switch</code>	Returns a value of <code>true</code> if a cell instance is a power switch cell. For example, <pre>get_property [get_cells mmu/U1] is_power_switch</pre> <i>Return type:</i> boolean
<code>is_retention</code>	Returns a value of <code>true</code> if a cell instance is a retention cell. For example, <pre>get_property [get_cells mmu/U1] is_retention</pre> <i>Return type:</i> boolean
<code>level_shifter_type</code>	Returns the type of level-shifter (e.g., LH, HL, or HL_LH) that a cell instance is. For example, <pre>get_property [get_cells mmu/U1] level_shifter_type</pre> <i>Return type:</i> string

pg_pins	Returns a collection of the PG pins that are present in a cell instance. For example, <pre>get_property [get_cells mmu/U1] pg_pins</pre> <i>Return type:</i> collection
power_switch_type	Returns the type of power switch (e.g., coarse-grain, fine-grain) that a cell instance is. For example, <pre>get_property [get_cells mmu/U1] power_switch_type</pre> <i>Return type:</i> string
std_cell_main_rail_name	Returns the name of the main power rail driving the power pins of a cell instance that is the <code>pg_pin</code>, which has the <code>std_cell_main_rail</code> library attribute set as <code>true</code> for the instance cell. For example, <pre>get_property [get_cells mmu/U1] std_cell_main_rail_name</pre> <i>Return type:</i> string

Clock Properties

child_clocks	Returns the first level of generated clocks. This property also works for nested generated clocks. <i>Return type:</i> collection For example, <pre>get_property [get_clocks CK] child_clocks</pre>
clock_network_pins	Returns a collection of all pins on the clock network for the clock. <i>Return type:</i> collection

comment	Returns the comment set for the specified clock. <i>Return Type:</i> String For example, <code>get_property [get_clocks CK] comment</code>
delay_max_fall	Returns the maximum falling delay value for the clock. <i>Return type:</i> float
delay_max_rise	Returns the maximum rising delay value for the clock. <i>Return type:</i> float
delay_min_fall	Returns the minimum falling delay value for the clock. <i>Return type:</i> float
delay_min_rise	Returns the minimum rising delay value for the clock. <i>Return type:</i> float
divide_by	Returns dfactor set for the specified clock. For example, <code>get_property [get_clocks ck] divide_by</code> <i>Return Type:</i> Integer
driving_network_pins	Returns a collection of the network pins of the driving clock. For example, <code>get_property [get_clocks clk] driving_network_pins</code> <i>Return Type:</i> Collection
duty_cycle	Returns the duty cycle for the specified clock. For example, <code>get_property [get_clocks CLK] duty_cycle</code> <i>Return Type:</i> Float
edges	Return the edges that are set for a specified clock. For example, <code>get_property [get_clocks ck] edges</code> <i>Return Type:</i> String

edge_shift	Return the edge shift that is set for a specified clock. For example, <code>get_property [get_clocks ck] edge_shift</code> Return Type: String
generated_clocks_extended	Returns generated clocks derived from the regular clock. <i>Return type:</i> collection
hierarchical_name	Returns the complete hierarchical name of the clock. <i>Return type:</i> string
hold_uncertainty	Returns the most conservative uncertainty of all the possible uncertainty assertions associated with a pin, when the <code>set_clock_uncertainty -hold</code> parameter is specified. For example, <code>get_property [get_clocks <clock name>] hold_uncertainty</code> <i>Return Type:</i> Float
is_context_mapped	Returns a value of <code>true</code> if a clock is mapped to the top in a context. Additionally, this is also reported with the <code>report_clocks</code> command. For example, <code>get_property [get_clocks <clock name>] is_context_mapped</code> <i>Return Type:</i> Boolean
ideal_transition_max_fall	Returns the ideal clock transition asserted on clock waveforms specified with the <code>set_clock_transition</code> command using the <code>-fall</code> and <code>-max</code> parameters. <i>Return type:</i> float
ideal_transition_max_rise	Returns the ideal clock transition asserted on clock waveforms specified with the <code>set_clock_transition</code> command using the <code>-rise</code> and <code>-max</code> parameters. <i>Return type:</i> float
ideal_transition_min_fall	Returns the ideal clock transition asserted on clock waveforms specified with <code>set_clock_transition</code> command using the <code>-fall</code> and <code>-min</code> parameters. <i>Return type:</i> float

<code>ideal_transition_min_rise</code>	Returns the ideal clock transition asserted on clock waveforms specified with <code>set_clock_transition</code> command using the <code>-rise</code> and <code>-min</code> parameters. <i>Return type:</i> float
<code>is_active</code>	Returns a value of <code>true</code> if the clock specified is active in the current view. <i>Return type:</i> boolean
<code>is_combinational_source_path</code>	Returns a value of <code>true</code> if <code>create_generated_clock -combinational</code> is specified for the creation of the generated clock. For example, <pre>get_property [get_clocks GCLK] is_combinational_source_path</pre> <i>Return type:</i> boolean
<code>is_generated</code>	Returns a value of <code>true</code> if the clock is a generated clock. <i>Return type:</i> boolean
<code>is_inverted</code>	Returns a value of <code>true</code>, if a specified clock is inverted. For example, <pre>get_property [get_clocks ck] is_inverted</pre> Return Type: boolean
<code>is_library_created</code>	Returns a value of <code>true</code> if <code>generated_clock</code> is specified in a Liberty <code>generated_clock</code> group and not created by a <code>create_generated_clock</code> constraint. For example, <pre>get_property [get_clocks UMC/generated_clock_cell/clkint] is_library_created</pre> <i>Return type:</i> boolean
<code>is_source_inverted</code>	Returns a value of <code>true</code> if a specified clock source is inverted. For example, <pre>get_property [get_clocks clk] is_source_inverted</pre> <i>Return Type:</i> Boolean

is_propagated_clock	Returns a value of <code>true</code> if the clock is in propagated mode. <i>Return type:</i> boolean
is_virtual	Returns a value of <code>true</code> if the specified clock is virtual. For example, <code>get_property [get_clocks v_clk] is_virtual</code> <i>Return Type:</i> boolean
latency_fall_max	Returns the maximum fall latency for a clock, when the <code>set_clock_latency -max -fall</code> parameters are specified. <i>Return type:</i> float
latency_fall_min	Returns the minimum fall latency for a clock, when the <code>set_clock_latency -min -fall</code> parameters are specified. <i>Return type:</i> float
latency_rise_max	Returns the maximum rise latency for a clock, when the <code>set_clock_latency -max -rise</code> parameters are specified. For example, <code>get_property [get_clocks <clock name>] latency_rise_max</code> <i>Return Type:</i> float
latency_rise_min	Returns the minimum rise latency for a clock, when the <code>set_clock_latency -min -rise</code> parameters are specified. For example, <code>get_property [get_clocks <clock name>] latency_rise_min</code> <i>Return Type:</i> float
lead_edge_type	Returns an edge type (rise or fall) corresponding to the leading edge for a specified clock. For example, <code>get_property [get_clocks <clock name>] lead_edge_type</code> <i>Return Type:</i> string
master_clock	Returns a collection of the master clocks for a specified clock. For example, <code>get_property [get_clocks clk] master_clock</code> <i>Return Type:</i> collection

master_source	Returns a collection of the master sources for a specified clock. For example, <pre>get_property [get_clocks ck] master_source</pre> <i>Return Type:</i> collection
max_capacitance_clock_path_fall	Returns fall max_capacitance value on clock paths. <i>Return type:</i> float
max_capacitance_clock_path_rise	Returns rise max_capacitance value on clock paths. <i>Return type:</i> float
max_capacitance_data_path_fall	Returns fall max_capacitance value on data paths. <i>Return type:</i> float
max_capacitance_data_path_rise	Returns rise max_capacitance value on data paths. <i>Return type:</i> float
max_transition_clock_path_fall	Returns fall max_transition value on clock paths. <i>Return type:</i> float
max_transition_clock_path_rise	Returns rise max_transition value on clock paths. <i>Return type:</i> float
max_transition_data_path_fall	Returns fall max_transition value on data paths. <i>Return type:</i> float
max_transition_data_path_rise	Returns rise max_transition value on data paths. <i>Return type:</i> float
min_pulse_width_high	Returns the minimum pulse width for high signals for the specified clock, when the <code>set_min_pulse_width -high</code> parameter is specified. For example, <pre>get_property [get_clocks <clock name>] min_pulse_width_high</pre> <i>Return Type:</i> float

min_pulse_width_low	Returns the minimum pulse width for low signals for the specified clock, when the <code>set_min_pulse_width -low</code> parameter is specified. For example, <pre>get_property [get_clocks <clock name>] min_pulse_width_low</pre> <i>Return Type:</i> float
multiply_by	Returns mfactor set for the specified clock. For example, <pre>get_property [get_clocks clk] multiply_by</pre> <i>Return Type:</i> integer
name	Returns the name of the clock. <i>Return type:</i> string
object_type	Returns the object type <code>clock</code>. <i>Return type:</i> string
period	Returns the clock period. <i>Return type:</i> float
setup_uncertainty	Returns the most conservative uncertainty of all the possible uncertainty assertions associated with pins, when the <code>set_clock_uncertainty -setup</code> parameter is specified for a clock. For example, <pre>get_property [get_clocks <clock name>] setup_uncertainty</pre> <i>Return Type:</i> float
source_jitter_early_fall_max	Returns the amount of the maximum early fall source insertion delay that is due to cycle-to-cycle variation. <i>Return Type:</i> float
source_jitter_early_fall_min	Returns the amount of the minimum early fall source insertion delay that is due to cycle-to-cycle variation. <i>Return Type:</i> float
source_jitter_early_rise_max	Returns the amount of the maximum early rise source insertion delay that is due to cycle-to-cycle variation. <i>Return Type:</i> float

source_jitter_early_rise_min	Returns the amount of the minimum early rise source insertion delay that is due to cycle-to-cycle variation. <i>Return Type:</i> float
source_jitter_full_cycle_hold	Returns the early full cycle path jitter that is specified on the clock source. <i>Return Type:</i> float
source_jitter_full_cycle_setup	Returns the late full cycle path jitter that is specified on the clock source. <i>Return Type:</i> float
source_jitter_half_cycle_hold	Returns the early half cycle path jitter that is specified on the clock source. <i>Return Type:</i> float
source_jitter_half_cycle_setup	Returns the late half cycle path jitter that is specified on the clock source. <i>Return Type:</i> float
source_jitter_late_fall_max	Returns the amount of the maximum late fall source insertion delay that is due to cycle-to-cycle variation. <i>Return Type:</i> float
source_jitter_late_fall_min	Returns the amount of the minimum late fall source insertion delay that is due to cycle-to-cycle variation. <i>Return Type:</i> float
source_jitter_late_rise_max	Returns the amount of the maximum late rise source insertion delay that is due to cycle-to-cycle variation. <i>Return Type:</i> float
source_jitter_late_rise_min	Returns the amount of the minimum late rise source insertion delay that is due to cycle-to-cycle variation. <i>Return Type:</i> float

source_latency_early_fall_max	Returns the early source latency for the falling transition at the maximum corner, when the <code>set_clock_latency -source -early -fall -max</code> parameters are specified for the clock. For example, <pre>get_property [get_clocks <clock name>] source_latency_early_fall_max</pre> <i>Return Type:</i> float
source_latency_early_fall_min	Returns the early source latency for the falling transition at the min corner, when the <code>set_clock_latency -source -early -fall -min</code> parameters are specified for the clock. For example, <pre>get_property [get_clocks <clock name>] source_latency_early_fall_min</pre> <i>Return type:</i> float
source_latency_early_rise_max	Returns the early source latency for the rising transition at the max corner, when the <code>set_clock_latency -source -early -rise -max</code> parameters are specified for the clock. For example, <pre>get_property [get_clocks <clock name>] source_latency_early_rise_max</pre> <i>Return Type:</i> float
source_latency_early_rise_min	Returns the early source latency for the rising transition at the min corner, when the <code>set_clock_latency -source -early -rise -min</code> parameters are specified for the clock. For example, <pre>get_property [get_clocks <clock name>] source_latency_early_rise_min</pre> <i>Return type:</i> float
source_latency_late_fall_max	Returns the late source latency for the falling transition at the max corner, when the <code>set_clock_latency -source -late -fall -max</code> parameters are specified for the clock. For example, <pre>get_property [get_clocks <clock name>] source_latency_late_fall_max</pre> <i>Return type:</i> float

source_latency_late_fall_min	Returns the late source latency for the falling transition at the min corner, when the <code>set_clock_latency -source -late -fall -min</code> parameters are specified for the clock. For example, <pre>get_property [get_clocks <clock name>] source_latency_late_fall_min</pre> <i>Return type:</i> float
source_latency_late_rise_max	Returns the late source latency for the rising transition at the max corner, when the <code>set_clock_latency -source -late -rise -max</code> parameters are specified for the clock. For example, <pre>get_property [get_clocks <clock name>] source_latency_late_rise_max</pre> <i>Return type:</i> float
source_latency_late_rise_min	Returns the late source latency for the rising transition at the min corner, when the <code>set_clock_latency -source -late -rise -min</code> parameters are specified for the clock. For example, <pre>get_property [get_clocks <clock name>] source_latency_late_rise_min</pre> <i>Return type:</i> float
source_latency_pins	Returns a list of pin or port object(s), which are present between the target pins of a generated clock and master clock. For example, <pre>get_property [get_clocks GCLK] source_latency_pins</pre> <i>Return type:</i> collection
sources	Returns a collection of the clock's source pins or ports. <i>Return type:</i> collection
view_name	In multi-mode multi-corner mode, returns the analysis view name associated with a given clock. <i>Return type:</i> string
waveform	Returns the rising and falling edge times of the waveform. <i>Return type:</i> string

Design Properties

analysis_type	Returns the analysis mode: <code>single</code>, <code>bc_wc</code>, or <code>on_chip_variation</code>. <i>Return type:</i> string
boundary_model_analysis	Returns a value of <code>true</code> if the design is a boundary model. For example, <pre>get_property [get_designs MPTC] boundary_model_analysis</pre> <i>Return type:</i> boolean
capacitance_unit_in_farad	Returns the capacitance unit specified in the library. <i>Return type:</i> float
chip_size	Returns the chip size. The chip size can be specified with the <code>timing_aocv_chip_size</code> attribute. If this attribute is not set, then the software will calculate the chip size from the design node locations. The attribute setting takes precedence over the software setting. <i>Return type:</i> float
current_unit_in_amp	Returns the current unit specified in the library. <i>Return type:</i> float
hierarchical_name	Returns the complete hierarchical name of the design. <i>Return type:</i> string
is_dont_touch	Returns <code>true</code> if the design is specified through the <code>set_dont_touch</code> command. <i>Return type:</i> boolean
is_max_transition_asserted	Returns a value of <code>true</code> if a maximum transition value (set using the <code>set_max_transition</code> command) is defined in the design. <i>Return type:</i> boolean

<code>is_min_transition_asserted</code>	Returns a value of <code>true</code> if a minimum transition value (set using the <code>set_min_transition</code> command) is defined in the design. <i>Return type:</i> <code>boolean</code>
<code>max_capacitance</code>	Returns the maximum capacitance value for the design. <i>Return type:</i> <code>float</code>
<code>max_fanout</code>	Returns the maximum fanout value for the design. <i>Return type:</i> <code>float</code>
<code>min_fanout</code>	Returns the minimum fanout value for the design. <i>Return type:</i> <code>float</code>
<code>max_transition</code>	Returns the maximum transition design rule limit for the design. <i>Return type:</i> <code>float</code>
<code>min_transition</code>	Returns the minimum transition design rule limit for the design. <i>Return type:</i> <code>float</code>
<code>min_capacitance</code>	Returns the minimum capacitance value for the design. <i>Return type:</i> <code>float</code>
<code>object_type</code>	Returns the object type <code>design</code> . <i>Return type:</i> <code>string</code>
<code>operating_condition_max</code>	Returns the name of the maximum operating condition specified for the design. <i>Return type:</i> <code>string</code>
<code>operating_condition_min</code>	Returns the name of the minimum operating condition specified for the design. <i>Return type:</i> <code>string</code>
<code>process_max</code>	Returns the process value of the maximum operating condition specified for the design. <i>Return type:</i> <code>float</code>

process_min	Returns the process value of the minimum operating condition specified for the design. <i>Return type:</i> float
resistance_unit_in_ohm	Returns the resistance value from the library. <i>Return type:</i> float
slew_threshold_percent_fall_high	Returns the upper slew trip point for falling waveforms, specified as a percent. <i>Return type:</i> float
slew_threshold_percent_fall_low	Returns the lower slew trip point for falling waveforms, specified as a percent. <i>Return type:</i> float
slew_threshold_percent_rise_high	Returns the upper slew trip point for rising waveforms, specified as a percent. <i>Return type:</i> float
slew_threshold_percent_rise_low	Returns the lower slew trip point for rising waveforms, specified as a percent. <i>Return type:</i> float
temperature_max	Returns the temperature value of the maximum operating condition for the design. <i>Return type:</i> float
temperature_min	Returns the temperature value of the minimum operating condition for the design. <i>Return type:</i> float
timing_context_analysis	Returns a value of <code>true</code> if timing context analysis is enabled on a design. <i>Return type:</i> boolean
time_unit_in_second	Returns the time units of the design, in seconds. that is, time unit of the design is 1.000000ns, the property returns 1.000000e-09. <i>Return type:</i> float

<code>tree_type_max</code>	Returns the value of the <code>tree_type</code> attribute for the specified maximum operating condition. <i>Return type:</i> string
<code>tree_type_min</code>	Returns the value of the <code>tree_type</code> attribute for the specified minimum operating condition. <i>Return type:</i> string
<code>voltage_max</code>	Returns the voltage value of the maximum operating condition for the design. <i>Return type:</i> float
<code>voltage_min</code>	Returns the voltage value of the minimum operating condition for the design. <i>Return type:</i> float
<code>voltage_unit_in_volt</code>	Returns the voltage units specified in the library for the design. <i>Return type:</i> float

Library Properties

<code>default_max_transition</code>	Returns the default maximum transition time limit specified for a given library. <i>Return type:</i> string
<code>default_operating_conditions</code>	Returns the default operating conditions specified for a given library. For example, <pre>get_property [get_libs FreePDK45_lib_v1.0] default_operating_conditions</pre> <i>Return type:</i> string
<code>hierarchical_name</code>	Returns the hierarchical path name for the library. <i>Return type:</i> string
<code>input_threshold_pct_fall</code>	Returns the value of threshold point on an input pin signal falling from 1 to 0, which is used in modelling the delay of a signal transmitting from an input pin to an output pin. <i>Return type:</i> float

input_threshold_pct_rise	Returns the value of threshold point on an input pin signal rising from 0 to 1, which is used in modelling the delay of a signal transmitting from an input pin to an output pin. <i>Return type:</i> float
lib_file_path	Reports full on-disk path of a library. In case of a library database (LDB) file, the property will return the full on-disk path of the original library from which LDB was compiled. <i>Return type:</i> string
lib_version	Returns the software version in which the library file (LDB) was generated. <i>Return type:</i> string
nominal_process	Returns a value of the process either modeled as nominal process or as the process in default operating condition in the library. For example, <pre>get_property [get_libs sc_cmoslp] nominal_process</pre> <i>Return Type:</i> float
nominal_temperature	Returns a value of the temperature either modeled as nominal temperature or as the temperature in default operating condition in the library. For example, <pre>get_property [get_libs sc_cmoslp] nominal_temperature</pre> <i>Return Type:</i> float
nominal_voltage	Returns a value of the voltage either modeled as nominal voltage or as the voltage in default operating condition in the library. For example, <pre>get_property [get_libs sc_cmoslp] nominal_voltage</pre> <i>Return Type:</i> float
object_type	Returns the object type library. <i>Return type:</i> string

output_threshold_pct_fall	Returns the value of threshold point on an output signal falling from 1 to 0, which is used in modelling the delay of a signal transmitting from an input pin to an output pin. <i>Return type:</i> float
output_threshold_pct_rise	Returns the value of threshold point on an output signal rising from 0 to 1, which is used in the modelling of a signal transmitting from an input pin to an output pin. <i>Return type:</i> float
power_rails	Returns the name of the power rails along with their corresponding voltages as defined in the <code>voltage_map</code> attribute in the library. For example, <pre>get_property [get_libs sc_cmoslp] power_rails</pre> Output: Is a list of lists, each list showing the power rail name along with its associated voltage. { {VDDG 1.045} {VDD 1.045} {VSS 0} } <i>Return Type:</i> string
slew_derate_from_library	Specifies how the transition times found in the library need to be derated to match the transition times between the characterization trip points. <i>Return type:</i> float
slew_lower_threshold_pct_fall	Returns the value of lower threshold point used in modeling the delay of a pin falling from 1 to 0. <i>Return type:</i> float
slew_lower_threshold_pct_rise	Returns the value of lower threshold point used to model the delay of a pin rising from 0 to 1. <i>Return type:</i> float
slew_upper_threshold_pct_fall	Returns the value of upper threshold point used to model the delay of a pin falling from 1 to 0. <i>Return type:</i> float
slew_upper_threshold_pct_rise	Returns the value of upper threshold point used to model the delay of a pin rising from 0 to 1. <i>Return type:</i> float

source_file_name	Returns the full path of all library files that contain the specified library name. The use model is given below: <pre>get_property [get_libs libname] source_file_name [-view viewName]</pre> If the <code>-view</code> parameter is specified, the property returns the path of the library files in the given analysis view. If this parameter is not specified, the command returns the path of all library files in all the analysis views. <i>Return Type:</i> string
threshold_voltage_group	Returns the threshold voltage group of a library. For example, <pre>get_property [get_lib FreePDK45_lib_v1.0] threshold_voltage_group</pre> <i>Return Type:</i> string

Library Cell Properties

area	Returns the area of the library cell. <i>Return Type:</i> float
cell_footprint	Returns the cell footprint against a library cell, which the same layout boundary. For example, <pre>get_property [get_lib_cells 1.08_CTS_HT.db/CTB_</pre> <i>Return Type:</i> String
clock_gating_integrated_cell	Returns the clock gating integrated cells present in a For example, <pre>get_property [get_lib_cells CTS_HT.db/ICG_F4_HV</pre> <i>Return Type:</i> String

<code>late_clock_check_incremental_derate_factor</code>	Returns the late clock path library cell check increment <code>increment</code> parameter. <i>Return Type:</i> float
<code>late_data_check_incremental_derate_factor</code>	Returns the late data path library cell check increment <code>increment</code> parameter. <i>Return Type:</i> float
<code>late_fall_clock_incremental_derate_factor</code>	Returns the late clock path library cell check increment <code>increment</code> parameter - when the <code>-fall</code> parameter is set. <i>Return Type:</i> float
<code>late_fall_data_incremental_derate_factor</code>	Returns the late data path library cell check increment <code>increment</code> parameter - when the <code>-fall</code> parameter is set. <i>Return Type:</i> float
<code>early_clock_check_incremental_derate_factor</code>	Returns the early clock path library cell check increment <code>increment</code> parameter. <i>Return Type:</i> float
<code>early_data_check_incremental_derate_factor</code>	Returns the early data path library cell check increment <code>increment</code> parameter. <i>Return Type:</i> float
<code>early_fall_clock_incremental_derate_factor</code>	Returns the early clock path library cell check increment <code>increment</code> parameter - when the <code>-fall</code> parameter is set. <i>Return Type:</i> float
<code>early_fall_data_incremental_derate_factor</code>	Returns the early data path library cell check increment <code>increment</code> parameter - when the <code>-fall</code> parameter is set. <i>Return Type:</i> float
<code>early_fall_mean_slew_derate_factor</code>	Returns the early fall mean transition derate factor of the library. For example, <code>get_property [get_lib_cells FreePDK45_lib_v1.0/</code> <i>Return Type:</i> float

<code>early_fall_sigma_slew_derate_factor</code>	Returns the early fall sigma transition derate factor of the library cell. For example, <pre>get_property [get_lib_cells FreePDK45_lib_v1.0/]</pre> <i>Return Type:</i> float
<code>early_rise_clock_incremental_derate_factor</code>	Returns the early clock path library cell check incremental derate factor when the <code>-increment</code> parameter is specified. <i>Return Type:</i> float
<code>early_rise_data_incremental_derate_factor</code>	Returns the early data path library cell check incremental derate factor when the <code>-rise</code> parameter is specified. <i>Return Type:</i> float
<code>early_rise_mean_slew_derate_factor</code>	Returns the early rise mean transition derate factor of the library cell. For example, <pre>get_property [get_lib_cells FreePDK45_lib_v1.0/]</pre> <i>Return Type:</i> float
<code>early_rise_sigma_slew_derate_factor</code>	Returns the early rise sigma transition derate factor of the library cell. For example, <pre>get_property [get_lib_cells FreePDK45_lib_v1.0/]</pre> <i>Return Type:</i> float
<code>early_fall_slew_derate_factor</code>	Returns the derate factor applied on a library cell when the <code>-fall</code> parameter is specified. <i>Return Type:</i> float
<code>early_rise_slew_derate_factor</code>	Returns the derate factor applied on a library cell when the <code>-rise</code> parameter is specified. For example, <pre>get_property [get_lib_cells CTS_HT.db/ICG_F4_HT]</pre> <i>Return Type:</i> float
<code>fall_input_switching_derate_factor</code>	Returns the derate factor applied on a library cell when the <code>-fall</code> parameter is specified. For example, <pre>get_property [get_lib_cells PDK45_v1.0/IV_X32]</pre> <i>Return Type:</i> float

has_ccs_noise	Returns a value of <code>true</code> if a library cell has a CCS no For example, <pre>get_property [get_lib_cells tst/tst_nm6] has_ccs_noise</pre> <i>Return type:</i> boolean
has_socv	Returns a value of <code>true</code> if a library cell has a spatial c For example, <pre>get_property [get_lib_cells PK4_lib_v1.0/A4_X2] has_socv</pre> <i>Return type:</i> boolean
has_spatial	Returns a value of <code>true</code> if a spatial derate exists for a <i>Return type:</i> boolean
hierarchical_name	Returns the complete hierarchical name of the librar For example, <pre>get_property [get_lib_cells -of [get_cell AB_IT]] hierarchical_name</pre> <i>Return Type:</i> string
is_black_box	Returns a value of <code>true</code> if the cell is a black box cell. A cell is considered as a black box if the "function" d <i>Return type:</i> boolean
is_buffer	Returns a value of <code>true</code> if the associated library cell i For example, <pre>get_property [get_lib_cells -of [get_cell AB_IT]] is_buffer</pre> <i>Return type:</i> boolean
is_combinational	Returns a value of <code>true</code> if the library cell is a combin <i>Return type:</i> boolean
is_dont_touch	Returns a value of <code>true</code> if the library cell definition in <i>Return Type:</i> boolean
is_dont_use	Returns a value of <code>true</code> if the library cell description i <i>Return Type:</i> boolean
is_fall_edge_triggered	Returns a value of <code>true</code> if the library cell is triggered <i>Return Type:</i> boolean

<code>is_instantiated</code>	Returns a value of <code>true</code> if library cells are instantiated. For example, <pre>get_property [get_lib_cells P4_lib_v1.0/N4_X2]</pre> <i>Return type:</i> boolean
<code>is_interface_timing</code>	Returns a value of <code>true</code> if a library cell has interface timing. <i>Return type:</i> boolean
<code>is_level_shifter</code>	Returns a value of <code>true</code> if a cell instance is a level-shifter. <i>Return type:</i> boolean
<code>is_integrated_clock_gating_cell</code>	Returns a value of <code>true</code> if a cell is an integrated clock-gating cell. For example, <pre>get_property [get_lib_cells CTS_HT.db/ICG_F7_HT]</pre> <i>Return type:</i> boolean
<code>is_inverter</code>	Returns a value of <code>true</code> if a cell instance is an inverter. For example, <pre>get_property [get_lib_cells -of [get_cells inv]]</pre> <i>Return type:</i> boolean
<code>is_level_shifter</code>	Returns a value of <code>true</code> if a cell instance is a level-shifter. For example, <pre>get_property [get_lib_cells -of [get_libs mk_1p]]</pre> <i>Return type:</i> boolean
<code>is_macro_cell</code>	Returns a value of <code>true</code> if a macro cell exists in a library. For example, <pre>get_property [get_lib_cells L_mro2/mro2y] is_macro_cell</pre> <i>Return type:</i> boolean

is_memory_cell	Returns a value of <code>true</code> if the cell is a memory cell. <i>Return type:</i> boolean Note: The library cells that have a memory group de example: <pre>cell () { : memory() { type : ram ; address_width : 10 ; word_width : 7 ; } }</pre>
is_msv	Returns a value of <code>true</code> if a cell is an MSV cell. For example, get_property [get_lib_cells mk_1pv_125c/L8MTR] <i>Return type:</i> boolean
is_negative_level_sensitive	Returns a value of <code>true</code> if the library cell is used as a <i>Return type:</i> boolean
is_pad_cell	Returns a value of <code>true</code> if the Liberty library is_pad_c <i>Return type:</i> boolean
is_pll_cell	Returns a value of <code>true</code> if the Liberty library is_pll_c <i>Return type:</i> boolean
is_positive_level_sensitive	Returns a value of <code>true</code> if the library cell is used as a <i>Return type:</i> boolean
is_rise_edge_triggered	Returns a value of <code>true</code> if the library cell is triggered <i>Return Type:</i> boolean
is_sequential	Returns a value of <code>true</code> if the library cell is a latch or <i>Return type:</i> boolean

<code>is_tristate</code>	Returns a value of <code>true</code> if the library cell definition in <i>Return type:</i> boolean
<code>late_fall_clock_period_derate_factor</code>	Returns the derate factor for the clock period when tl specified. <i>Return type:</i> float
<code>late_fall_clock_period_mean_derate_factor</code>	Returns the late/fall derate factor for the clock period <i>Return type:</i> float
<code>late_fall_clock_period_sigma_derate_factor</code>	Returns the late/fall derate factor for the clock period <i>Return type:</i> float
<code>late_fall_mean_slew_derate_factor</code>	Returns the late/fall mean transition derate factor on For example, <code>get_property [get_lib_cells FreePDK45_lib_v1.0/</code> <i>Return type:</i> float
<code>late_fall_pulse_width_derate_factor</code>	Returns the late/fall derate factor for the pulse width specified. <i>Return type:</i> float
<code>late_fall_pulse_width_mean_derate_factor</code>	Returns the late/fall derate factor for the pulse width <i>Return type:</i> float
<code>late_fall_pulse_width_sigma_derate_factor</code>	Returns the late/fall derate factor for the pulse width <i>Return type:</i> float
<code>late_fall_sigma_slew_derate_factor</code>	Returns the late/fall sigma transition derate factor on For example, <code>get_property [get_lib_cells FreePDK45_lib_v1.0/</code> <i>Return type:</i> float
<code>late_fall_slew_derate_factor</code>	Returns the derate factor applied on a library cell, wh are specified. <i>Return type:</i> float
<code>late_rise_clock_incremental_derate_factor</code>	Returns the late clock path library cell check increme increment parameter - when the <code>-rise</code> parameter is : <i>Return Type:</i> float

<code>late_rise_data_incremental_derate_factor</code>	Returns the late data path library cell check increment parameter - when the <code>-rise</code> parameter is specified. <i>Return Type:</i> float
<code>late_rise_clock_period_derate_factor</code>	Returns the derate factor for the clock period when the <code>-clock</code> parameter is specified. <i>Return type:</i> float
<code>late_rise_clock_period_mean_derate_factor</code>	Returns the late/rise derate factor for the clock period when the <code>-clock</code> parameter is specified. <i>Return type:</i> float
<code>late_rise_clock_period_sigma_derate_factor</code>	Returns the late/rise derate factor for the clock period when the <code>-clock</code> parameter is specified. <i>Return type:</i> float
<code>late_rise_mean_slew_derate_factor</code>	Returns the late/rise mean transition derate factor or sigma transition derate factor for the specified cell. For example, <code>get_property [get_lib_cells FreePDK45_lib_v1.0/]</code> <i>Return type:</i> float
<code>late_rise_pulse_width_derate_factor</code>	Returns the derate factor for the pulse width check when the <code>-pulse_width</code> parameter is specified. <i>Return type:</i> float
<code>late_rise_pulse_width_mean_derate_factor</code>	Returns the late/rise derate factor for the pulse width when the <code>-pulse_width</code> parameter is specified. <i>Return type:</i> float
<code>late_rise_pulse_width_sigma_derate_factor</code>	Returns the late/rise derate factor for the pulse width when the <code>-pulse_width</code> parameter is specified. <i>Return type:</i> float
<code>late_rise_sigma_slew_derate_factor</code>	Returns the late/rise sigma transition derate factor or mean transition derate factor for the specified cell. For example, <code>get_property [get_lib_cells FreePDK45_lib_v1.0/]</code> <i>Return type:</i> float
<code>late_rise_slew_derate_factor</code>	Returns the derate factor applied on a library cell, when the <code>-cell</code> and <code>-slew</code> parameters are specified. For example, <code>get_property [get_lib_cells PK4_v1.0/IV_32] late_rise_slew_derate_factor</code> <i>Return type:</i> float

<code>mis_alignments_factor_min_fall</code>	Returns the minimum fall tuning factor applied on a <code>switching_alignment_factor</code> parameter is specified. <i>Return type:</i> float
<code>mis_alignments_factor_min_rise</code>	Returns the minimum rise tuning factor applied on a <code>switching_alignment_factor</code> parameter is specified. <i>Return type:</i> float
<code>master_physical_variant_cell</code>	Returns the master library cell of the specified physical variant. For example, <code>get_property [get_lib_cell cell_w/INV2] master_physical_variant_cell</code> <i>Return type:</i> string
<code>name</code>	Returns the leaf-level name of the library cell. <i>Return Type:</i> string
<code>object_type</code>	Returns the object type <code>lib_cell</code> . <i>Return Type:</i> string
<code>physical_variant_cells</code>	Returns the physical variant cells that are available in the library. For example, <code>get_property [get_lib_cells lca_md/SR1_md] physical_variant_cells</code> <i>Return Type:</i> string
<code>pin_count</code>	Returns the total number of signal pins. For example, <code>get_property [get_lib_cells PK45_v1.0/IN_X32] pin_count</code> <i>Return Type:</i> integer
<code>receiver_capacitance_type</code>	Returns the value of input capacitance group being used in the model (n-piece model). <i>Return Type:</i> string
<code>retention_cell</code>	Returns the value of the <code>retention_cell</code> attribute specified in the library. <i>Return type:</i> string

rise_input_switching_derate_factor	Returns the derate factor applied on a library cell, with the cell name specified. For example, <pre>get_property [get_lib_cells PK45_v1.0/DL_X2] rise_input_switching_derate_factor</pre> <i>Return type:</i> float
signal_pins	Returns the signal pins of a cell, along with the library cell name. For example, <pre>get_property [get_lib_cells PK45_v1.0/IN_X32] signal_pins</pre> <i>Return Type:</i> collection
sync_clear	Returns the collection of synchronous clear pins. Note: For a synchronous clear pin: • The flip-flop's function definition should have the clear pin. • The pin corresponding to the synchronous clear pin. For example, <pre>get_property [get_lib_cells tcbn05_bwph21016p51cnod_base_svtffgnp_0p825v_12] sync_clear</pre> <i>Return type:</i> collection
sync_enable	Returns the collection of synchronous enable pins. For example, <pre>get_property [get_lib_cells tcbn05_bwph21016p51cnod_base_ulvtllffgnp_0p825v_12] sync_enable</pre> <i>Return type:</i> collection
sync_preset	Returns the collection of synchronous preset pins. For example, <pre>get_property [get_lib_cells tcbn05_bwph21016p51cnod_base_svtffgnp_0p825v_12] sync_preset</pre> <i>Return type:</i> collection

test_scan_enable	Returns the collection of the test_scan_enable pins. For example, <pre>get_property [get_lib_cell SR80_W_125_0.855_0.8</pre> <i>Return type:</i> collection
test_scan_enable_inverted	Returns the collection of the test_scan_enable_inve. For example, <pre>get_property [get_lib_cells SR80_W_125_0.855_0. test_scan_enable_inverted</pre> <i>Return type:</i> collection
test_scan_in	Returns the collection of the test_scan_in pins. For example, <pre>get_property [get_lib_cells SR80_W_125_0.855_0.</pre> <i>Return type:</i> collection
test_scan_in_inverted	Returns the collection of the test_scan_in_inverted For example, <pre>get_property [get_lib_cell SR80_W_125_0.855_0.8</pre> <i>Return type:</i> collection
test_scan_out	Returns the collection of the test_scan_out pins. For example, <pre>get_property [get_lib_cells SR80_W_125_0.855_0.</pre> <i>Return type:</i> collection
test_scan_out_inverted	Returns the collection of the test_scan_out_inverte For example, <pre>get_property [get_lib_cell SR80_W_125_0.855_0.8 test_scan_out_inverted</pre> <i>Return type:</i> collection
output_signal_level_high	Returns the maximum voltage value of an output pin For example, <pre>get_property [get_lib_arcs -of [get_lib_cells p</pre> <i>Return type:</i> float

output_signal_level_low	Returns the minimum voltage value of an output pin For example, <pre>get_property [get_lib_arcs -of [get_lib_cells p</pre> <i>Return type:</i> float
threshold_voltage_group	Returns the voltage group defined at the library level (the <code>set_voltage_threshold_group</code> command). For example, <pre>get_property [get_lib_cells L40_HT.db/CG_F8_HT]</pre> <i>Return type:</i> string
timing_model_type	Returns the model type for a given cell or instance. <i>Return type:</i> string
ground_pins	Returns a collection of the ground pins of a library cell For example, <pre>get_property [get_lib_cells sc_cmoslp/A022X] gr</pre> <i>Return type:</i> collection
is_always_on	Returns a value of <code>true</code> if the <code>always_on</code> attribute of a always-on cell. For example, <pre>get_property [get_lib_cells sc_cmoslp/A0N22_X4M</pre> <i>Return type:</i> boolean
is_isolation_cell	Returns a value of <code>true</code> if the library cell is an isolation cell For example, <pre>get_property [get_lib_cells sc_cmoslp/ISO22_X4M</pre> <i>Return type:</i> boolean
is_power_switch	Returns a value of <code>true</code> when the <code>switch_cell_type</code> cell is a power-switch cell. For example, <pre>get_property [get_lib_cells sc_cmoslp/A022X] is</pre> <i>Return type:</i> boolean

<code>is_retention</code>	Returns a value of <code>true</code> when the <code>retention_cell</code> attribute is a retention cell. For example, <pre>get_property [get_lib_cells sc_cmoslp/RET22_X4M] is_retention</pre> <i>Return type:</i> boolean
<code>level_shifter_type</code>	Returns the type of level-shifter (e.g., LH, HL, or HL_ cell). For example, <pre>get_property [get_lib_cells sc_cmoslp/A2LVLD_X4] level_shifter_type</pre> <i>Return type:</i> string
<code>lib_pg_pins</code>	Returns a collection of all PG pins (both power and ground pins) of a library cell. For example, <pre>get_property [get_lib_cells sc_cmoslp/A022X] lib_pg_pins</pre> <i>Return type:</i> collection
<code>power_pins</code>	Returns a collection of the power pins of a library cell. For example, <pre>get_property [get_lib_cells sc_cmoslp/A022X] power_pins</pre> <i>Return type:</i> collection
<code>power_switch_type</code>	Returns the type of power-switch (e.g., coarse-grain, library cells). For example, <pre>get_property [get_lib_cells sc_cmoslp/A022X] power_switch_type</pre> <i>Return type:</i> string
<code>std_cell_main_rail_name</code>	Returns the name of a power rail that has the <code>std_cell_main_rail</code> property. <i>Return type:</i> string For example, <pre>get_property [get_lib_cells sc_cmoslp/A022X] std_cell_main_rail_name</pre>

Library Pin Properties

all_q_pin_of_d_pin	Returns a collection of all_q_pin_of_d_pin pins. For example, <pre>get_property [get_lib_pin srpg/SDRFFSRPQ_X1/D] all_q_pin_of_d_pin</pre> <i>Return type:</i> collection
capacitance	Returns the capacitance for the library pin. <i>Return type:</i> float
capacitance_max_fall	Returns the maximum value of the falling capacitance range. <i>Return type:</i> float
capacitance_max_rise	Returns the maximum value of the rising capacitance range. <i>Return type:</i> float
capacitance_min_fall	Returns the minimum value of the falling capacitance range. <i>Return type:</i> float
capacitance_min_rise	Returns the minimum value of the rising capacitance range. <i>Return type:</i> float
cell_name	Returns the library cell name for the corresponding library pins. For example, <pre>get_property [get_lib_pins PDK45_lib_v1.0/AOI211_X2/B] cell_name</pre> <i>Return type:</i> string
direction	Returns the direction of the library pin: in, out, or inout. <i>Return type:</i> string
drive_resistance_fall	Specifies the driving resistance of the cell for falling transitions. For example, <pre>get_property [get_lib_pins FreePDK45_lib_v1.0/BUF_X1/Z] drive_resistance_fall</pre> <i>Return type:</i> float

drive_resistance_rise	Specifies the driving resistance of the cell for rising transitions. For example, <pre>get_property [get_lib_pins FreePDK45_lib_v1.0/BUF_X1/Z] drive_resistance_rise</pre> <i>Return type:</i> float
fanout_load	Returns the fanout load value of the library pin. <i>Return type:</i> float
function	Returns the function for the corresponding library pins. For example, <pre>get_property [get_lib_pins PK4_lib_v1.0/AND2_X1/ZN] function</pre> <i>Return type:</i> string
hierarchical_name	Returns the hierarchical name of the library pin. <i>Return type:</i> string
input_signal_level	Returns the power rail name/signal that is defined for a library cell input pin. For example, <pre>get_property [get_lib_pins PK4_lib_v1.0/BUF_X32/A] input_signal_level</pre> <i>Return type:</i> string
input_signal_level_high	Returns the upper limit of partial voltage swing value that is defined for a library cell input pin. For example, <pre>get_property [get_lib_pins rvt_ss_0p9v/LVLL/A] input_signal_level_high</pre> <i>Return type:</i> float
input_signal_level_low	Returns the lower limit of partial voltage swing value that is defined for a library cell input pin. For example, <pre>get_property [get_lib_pins rvt_ss_0p9v/LVLL/A] input_signal_level_low</pre> <i>Return type:</i> float

<code>is_analog</code>	Returns a value of <code>true</code> if the library pin is an analog pin. For example, <pre>get_property [get_lib_pins PK4_lib_v1.0/AOI222_X2/ZN] is_analog</pre> <i>Return type:</i> boolean
<code>is_async</code>	Returns a value of <code>true</code> if the library pin is an asynchronous preset pin, or an asynchronous clear pin. <i>Return type:</i> boolean
<code>is_clear</code>	Returns a value of <code>true</code> if the pin is an asynchronous clear pin. <i>Return type:</i> boolean
<code>is_clock</code>	Returns a value of <code>true</code> if the library pin definition includes <code>clock:true</code>. <i>Return type:</i> boolean
<code>is_clock_gating_clock</code>	Returns a value of <code>true</code> if the library pin is defined as a clock pin of a clock gating cell. For example, <pre>get_property [get_lib_pins P40_CTS_HVT.db/ICG_HVT/CLKIN] is_clock_gating_clock</pre> <i>Return type:</i> boolean
<code>is_clock_gating_enable</code>	Returns a value of <code>true</code> if the library pin corresponds to the enable pin of a clock gating cell. For example, <pre>get_property [get_lib_pins P40_CTS_HVT.db/ICG_HVT/CLKIN] is_clock_gating_enable</pre> <i>Return type:</i> boolean
<code>is_clock_gating_test</code>	Returns a value of <code>true</code> if the pin corresponds to the test pin of a clock gating cell. For example, <pre>get_property [get_lib_pins */NAND2_X2/A2] is_clock_gating_test</pre> <i>Return type:</i> boolean

<code>is_clock_pin</code>	Returns a value of <code>true</code> if the library pin is a clock pin. For example, <pre>get_property [get_lib_pins srpg/SDRFFSRPQ_X1/CK] is_clock_pin</pre> <i>Return Type:</i> boolean
<code>is_data</code>	Returns a value of <code>true</code> if the library pin with defined sequential arcs is the data pin of a flip-flop. <i>Return type:</i> boolean
<code>is_fall_edge_triggered_clock</code>	Returns a value of <code>true</code> if the library pin is the clock pin of a falling edge triggered device. <i>Return type:</i> boolean
<code>is_fall_edge_triggered_data</code>	Returns a value of <code>true</code> if the library pin is the data pin of a falling edge triggered device. <i>Return type:</i> boolean
<code>is_iq_function</code>	Returns a value of <code>true</code> if the output is an IQ pin. For example, <pre>get_property [get_lib_pins */SDFFRS_X1/Q] is_iq_function</pre> <i>Return Type:</i> boolean
<code>is_iqn_function</code>	Returns a value of <code>true</code> if the output is an IQN pin. For example, <pre>get_property [get_lib_pins */SDFFRS_X1/QN] is_iqn_function</pre> <i>Return Type:</i> boolean
<code>is_isolation_cell_clock</code>	Returns a value of <code>true</code> if the clock pin is a pin of isolation cell clock. For example, <pre>get_property [get_lib_pins cell_w/INV/CLK] is_isolation_cell_clock</pre> <i>Return Type:</i> boolean
<code>is_negative_level_sensitive_clock</code>	Returns a value of <code>true</code> if the library pin is an enable pin of an active low level-sensitive device. <i>Return type:</i> boolean

<code>is_negative_level_sensitive_data</code>	Returns a value of <code>true</code> if the pin is a data pin of an active low level-sensitive device. <i>Return type:</i> boolean
<code>is_pad</code>	Returns a value of <code>true</code> if the library pin is a pad pin. For example, <code>get_property [get_lib_pins *] is_pad</code> <i>Return type:</i> boolean
<code>is_pll_feedback_pin</code>	Returns a value of <code>true</code> if the Liberty library <code>is_pll_feedback_pin</code> attribute is set to <code>true</code> for this library pin. <i>Return type:</i> boolean
<code>is_pll_output_pin</code>	Returns a value of <code>true</code> if the Liberty library <code>is_pll_output_pin</code> attribute is set to <code>true</code> for this library pin. <i>Return type:</i> boolean
<code>is_pll_reference_pin</code>	Returns a value of <code>true</code> if the Liberty library <code>is_pll_reference_pin</code> attribute is set to <code>true</code> for this library pin. <i>Return type:</i> boolean
<code>is_positive_level_sensitive_clock</code>	Returns a value of <code>true</code> if the library pin is an enable pin of an active high level-sensitive device. <i>Return type:</i> boolean
<code>is_positive_level_sensitive_data</code>	Returns a value of <code>true</code> if the pin is a data pin of an active high level-sensitive device. <i>Return type:</i> boolean
<code>is_preset</code>	Returns a value of <code>true</code> if the pin is a preset pin. <i>Return type:</i> boolean

<code>is_ref_clock_pin</code>	Returns a value of <code>true</code>: • If the library pin is a reference clock pin. • Valid instance pin object and on an active clock pin where a clock signal reaches, and sequential cell is not disabled by disabled timing arcs or case analysis. Any pin with clock check-arcs or trigger-arcs will also be reported, if an active clock phase is present on that pin. • Clock pin on an inferred clock gating cell. • Valid <code>lib_pin</code> object, if there is at least one instance of this <code>lib_pin</code> in the design, and if <code>is_clock_pin</code> property is set to <code>true</code>. Returns a value of <code>false</code>, if clock propagation is disabled with the <code>set_disable_timing</code> or <code>set_sense - stop_propagation</code> command. For example, <pre>get_property [get_lib_pins srpg/SDRFFSRPQ_X1/CK] is_ref_clock_pin</pre> <i>Return Type:</i> boolean
<code>is_rise_edge_triggered_clock</code>	Returns a value of <code>true</code> if the library pin is the clock pin of a rising edge triggered device. <i>Return type:</i> boolean
<code>is_rise_edge_triggered_data</code>	Returns a value of <code>true</code> if the library pin is the data pin of a rising edge triggered device. <i>Return type:</i> boolean
<code>is_tristate</code>	Returns a value of <code>true</code> if the library pin definition includes <code>three_state:true</code>. <i>Return type:</i> boolean
<code>max_capacitance</code>	Returns the maximum capacitance limit for the library pin. <i>Return type:</i> float
<code>max_fanout</code>	Returns the maximum fanout value for the library pin. <i>Return type:</i> float

max_transition	Returns the maximum transition time limit specified for a given library pin. If the limit is not specified for a library pin, then the limit specified at the corresponding library level will be used. <i>Return type:</i> float
min_transition	Returns the minimum transition time limit specified for a given library pin. If the limit is not specified for a library pin, then the limit specified at the corresponding library level will be used. <i>Return type:</i> float
min_capacitance	Returns the minimum capacitance limit for the library pin. <i>Return type:</i> float
min_fanout	Returns the minimum fanout value for the library pin. <i>Return type:</i> float
name	Returns the leaf-level name of the library cell pin. <i>Return type:</i> string
object_type	Returns the object type; in this case, lib_pin. <i>Return type:</i> string
related_ground_pin_name	Returns related ground pin names for the corresponding library pins. <i>Return type:</i> string For example, <pre>get_property [get_lib_pins sc_cmoslp/A022X/I1] related_ground_pin_name</pre>
related_power_pin_name	Returns related power pin names for the corresponding library pins. <i>Return type:</i> string
slew_threshold_percent_fall_high	Returns the upper slew trip point for falling waveforms, specified as a percent. <i>Return type:</i> float

slew_threshold_percent_fall_low	Returns the lower slew trip point for falling waveforms, specified as a percent. <i>Return type:</i> float
slew_threshold_percent_rise_high	Returns the upper slew trip point for rising waveforms, specified as a percent. <i>Return type:</i> float
slew_threshold_percent_rise_low	Returns the lower slew trip point for rising waveforms, specified as a percent. <i>Return type:</i> float
input_signal_level_voltage	Returns the voltage value corresponding to the power rail name/signal which is defined for the library-cell input pin. This voltage value is the full rail-to-rail voltage value that is associated with the relative power rail name through the <code>voltage_map</code> attribute defined in the library. For example, <pre>get_property [get_lib_pins sc_cmoslp/AO22X/I1] input_signal_level_voltage</pre> <i>Return type:</i> float
is_always_on	Returns a value of <code>true</code> if the <code>always_on</code> attribute of a library signal pin is set to <code>true</code> indicating that the library cell signal pin is an always-on pin. For example, <pre>get_property [get_lib_pins sc_cmoslp/AO22X/I1] is_always_on</pre> <i>Return type:</i> boolean
is_isolated	Returns a value of <code>true</code> if the <code>is_isolated</code> attribute of a library signal pin is set to <code>true</code> indicating that the library cell signal pin is an internally isolated pin. For example, <pre>get_property [get_lib_pins sc_cmoslp/AO22X/I1] is_isolated</pre> <i>Return type:</i> boolean

<code>is_isolation_cell_data</code>	Returns a value of <code>true</code> if the <code>isolation_cell_data_pin</code> attribute of a library signal pin is set to <code>true</code> indicating that the library cell signal pin is a data pin of an isolation library cell. For example, <pre>get_property [get_lib_pins sc_cmoslp/A022X/I1] is_isolation_cell_data</pre> <i>Return type:</i> boolean
<code>is_isolation_cell_enable</code>	Returns a value of <code>true</code> if the <code>isolation_cell_enable_pin</code> attribute of a library signal pin is set to <code>true</code> indicating that the library cell signal pin is an enable or control pin of an isolation library cell. For example, <pre>get_property [get_lib_pins sc_cmoslp/A022X/I1] is_isolation_cell_enable</pre> <i>Return type:</i> boolean
<code>is_level_shifter_data</code>	Returns a value of <code>true</code> if the <code>level_shifter_data_pin</code> attribute of a library signal pin is set to <code>true</code>, indicating that the library cell signal pin is a data pin of a library level-shifter cell. For example, <pre>get_property [get_lib_pins sc_cmoslp/A022X/I1] is_level_shifter_data</pre> <i>Return type:</i> boolean
<code>is_level_shifter_enable</code>	Returns a value of <code>true</code> if the <code>level_shifter_enable_pin</code> attribute of a library signal pin is set to be <code>true</code> indicating that the library-cell signal pin is an enable pin of a library level shifter cell. For example, <pre>get_property [get_lib_pins sc_cmoslp/A022X/I1] is_isolation_cell_enable</pre> <i>Return type:</i> boolean

is_power_switch_enable	Returns a value of <code>true</code> if the <code>switch_cell_type</code> attribute of the corresponding library cell is defined and the <code>switch_pin</code> attribute of the given library-cell signal pin is defined to be <code>true</code>. For example, <pre>get_property [get_lib_pins sc_cmoslp/A022X/I1] is_power_switch_enable</pre> <i>Return type:</i> boolean
is_retention_cell_enable	Returns a value of <code>true</code> if the <code>retention_pin</code> attribute of a signal pin is defined. For example, <pre>get_property [get_lib_pins sc_cmoslp/A022X/I1] is_retention_cell_enable</pre> <i>Return type:</i> boolean
output_signal_level	Returns the power rail name/signal that is defined for a library cell output and inout pins. For example, <pre>get_property [get_lib_pins sc_cmoslp/A022X/I1] output_signal_level</pre> <i>Return type:</i> string
output_signal_level_high	Returns the upper/higher limit of partial voltage swing value that is defined for a library cell output and inout pins. For example, <pre>get_property [get_lib_pins sc_cmoslp/A022X/I1] output_signal_level_high</pre> <i>Return type:</i> float
output_signal_level_low	Returns the lower limit of partial voltage swing value that is defined for a library cell output and inout pins. For example, <pre>get_property [get_lib_pins sc_cmoslp/A022X/I1] output_signal_level_low</pre> <i>Return type:</i> float

pin_capacitance	Returns the pin capacitance. For example, <pre>get_property [get_lib_pins FreePDK45_lib_v1.0/BUF_X1/A] pin_capacitance</pre> <i>Return type:</i> float
pin_capacitance_max_fall	Returns the maximum value of the falling capacitance range of the corresponding library pin. For example, <pre>get_property [get_lib_pins FreePDK45_lib_v1.0/BUF_X1/A] pin_capacitance_max_fall</pre> <i>Return type:</i> float
pin_capacitance_max_rise	Returns the maximum value of the rising capacitance range of the corresponding library pin. For example, <pre>get_property [get_lib_pins FreePDK45_lib_v1.0/BUF_X1/A] pin_capacitance_max_rise</pre> <i>Return type:</i> float
pin_capacitance_min_fall	Returns the minimum value of the falling capacitance range of the corresponding library pin. For example, <pre>get_property [get_lib_pins FreePDK45_lib_v1.0/BUF_X1/A] pin_capacitance_min_fall</pre> <i>Return type:</i> float
pin_capacitance_min_rise	Returns the minimum value of the rising capacitance range of the corresponding library pin. For example, <pre>get_property [get_lib_pins FreePDK45_lib_v1.0/BUF_X1/A] pin_capacitance_min_rise</pre> <i>Return type:</i> float
related_ground_pin	Returns the related ground pins as a collection for the corresponding library cell pins. For example, <pre>get_property [get_lib_pins sc_cmoslp/AO22X/I1] related_ground_pin</pre> <i>Return type:</i> collection

related_ground_pin_name	Returns the related ground pin names for the corresponding library cell pins. For example, <pre>get_property [get_lib_pins sc_cmoslp/A022X/I1] related_ground_pin_name</pre> <i>Return type:</i> string
related_ground_pin_rail_voltage	Returns the voltage value corresponding to the ground rail name defined for the <code>related_ground_pin</code> attribute of the library cell pin. This voltage value is the full rail-to-rail value that is associated with the relative ground rail name through the <code>voltage_map</code> attribute defined in the library. For example, <pre>get_property [get_lib_pins sc_cmoslp/A022X/I1] related_ground_pin_rail_voltage</pre> <i>Return type:</i> float
related_power_pin	Returns the related power pins as a collection for the corresponding library cell pins. For example, <pre>get_property [get_lib_pins sc_cmoslp/A022X/I1] related_power_pin</pre> <i>Return type:</i> collection
related_power_pin_name	Returns the related power pin names for the corresponding library cell pins. For example, <pre>get_property [get_lib_pins sc_cmoslp/A022X/I1] related_power_pin_name</pre> <i>Return type:</i> string
related_power_pin_rail_voltage	Returns the voltage value corresponding to the power rail name defined for the <code>related_power_pin</code> attribute of a library cell pin. This voltage value is the full rail-to-rail value that is associated with the relative power rail name through the <code>voltage_map</code> attribute defined in the library. For example, <pre>get_property [get_lib_pins sc_cmoslp/A022X/I1] related_power_pin_rail_voltage</pre> <i>Return type:</i> float

Library PG Pin Properties

is_std_cell_main_rail	Returns a value of <code>true</code> if the library power PG pin is the main rail of the library cell. This is determined by the <code>std_cell_main_rail</code> library attribute of the library <code>pg_pin</code>. <i>Return type:</i> boolean For example, <pre>get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/A022X]] is_std_cell_main_rail</pre>
name	Returns the name of the library PG pin as defined in the library and associated with the <code>pg_pin</code> library attribute. <i>Return type:</i> string For example, <pre>get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/A022X]] name</pre>
object_type	Returns <code>lib_pg_pin</code> as the object type for a library PG pin. <i>Return type:</i> string For example, <pre>get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/A022X]] object_type</pre>
pg_type	Returns the type of the library PG pin as associated with the <code>pg_type</code> attribute of the corresponding library PG pin. <i>Return type:</i> string For example, <pre>get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/A022X]] pg_type get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/A022X] -filter " name =~ *VDD*"] pg_type</pre>
rail_name	Returns the name of the rail to which the PG pin is connected and is associated with the <code>voltage_name</code> attribute of the library PG pin. <i>Return type:</i> string For example, <pre>get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/A022X]] rail_name</pre>

rail_voltage	Returns the voltage from the voltage_map association of the rail to which the library PG pin is connected. <i>Return type:</i> float For example, <pre>get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/A022X]] rail_voltage</pre>
tied_to	Returns the library PG pin which is connected to substrate-bias PG pin. <i>Return type:</i> string For example, <pre>get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/A022X]] tied_to</pre>

Library Timing Arc Properties

from_lib_pin	Returns a collection of the source library pins of the library timing arc. <i>Return type:</i> collection
has_ccs_noise	Returns a value of <code>true</code> if a cell has CCS noise data. For example, <pre>get_property [get_lib_arc -from ccs_timing_si/AN2D1BWP20P90/A1 -to ccs_timing_si/AN2D1BWP20P90/Z] has_ccs_noise</pre> <i>Return type:</i> boolean
has_mis_fall	Returns a value of <code>true</code>, if MIS (multi-input switching) derate fall value is specified for library timing arcs. For example, <pre>get_property [get_lib_arc -from FreePDK45_lib_v1.0/AND2_X1/A1 -to FreePDK45_lib_v1.0/AND2_X1/ZN] has_mis_fall</pre> <i>Return type:</i> boolean
has_mis_rise	Returns a value of <code>true</code>, if MIS (multi-input switching) derate rise value is specified for library timing arcs. For example, <pre>get_property [get_lib_arcs -from FreePDK45_lib_v1.0/OR2_X1/A1 -to FreePDK45_lib_v1.0/OR2_X1/ZN] has_mis_rise</pre> <i>Return type:</i> boolean

has_socv	Returns a value of <code>true</code> if a timing library arc in the library has a spatial derate table (SOCV). <i>Return type:</i> boolean
is_disabled	Return a value of <code>true</code> if a <code>set_disable_timing</code> constraint exists for an arc. <i>Return type:</i> boolean
mode	Returns the name of the group if the timing arc is defined as part of a Liberty mode group. For example, <pre>get_property [get_lib_arc -from c065lesram76x2x1x96b_PttV1200T025_lib/c065lesram76x2x1x96b/CL -to c065lesram76x2x1x96b_PttV1200T025_lib/c065lesram76x2x1x96b/RX] mode</pre> <i>Return type:</i> string
object_type	Returns the object type <code>lib_timing_arc</code>. <i>Return type:</i> string
sdf_cond	Returns the <code>sdf_cond</code> expression specified for the timing library arc in the library. <i>Return type:</i> string
sense	Returns the <code>timing_sense</code> specified for the timing library arc in the library. <i>Return type:</i> string
to_lib_pin	Returns a collection of the sink library pins of the library timing arc. <i>Return type:</i> collection
timing_type	Returns the type specified for the timing library arc in the library. <i>Return type:</i> string
when	Returns the <code>when</code> condition specified for the library timing arc in the library. <i>Return type:</i> string
when_library_string	Returns the exact value of the Liberty 'when' attribute for the specified arc. For example, <pre>get_property [get_lib_arc -from FreePDK45_lib_v1.0/BUF_X1/A -to FreePDK45_lib_v1.0/BUF_X1/Z] when_library_string</pre> <i>Return type:</i> string

Net Properties

<code>annotated_capacitance_max</code>	Returns the maximum annotated capacitance of the net for late path analysis. For example, <pre>get_property [get_nets w2] annotated_capacitance_max</pre> <i>Return type:</i> float
<code>annotated_capacitance_min</code>	Returns the minimum annotated capacitance of the net for late path analysis. For example, <pre>get_property [get_nets w2] annotated_capacitance_min</pre> <i>Return type:</i> float
<code>attackers</code>	Reports the parasitic data on a net - capacitance, resistance, or cross-coupling. <i>Return type:</i> collection
<code>capacitance_max</code>	Returns the total capacitance of the net for maximum conditions. <i>Return type:</i> float
<code>coupling_capacitance_max</code>	Returns the maximum value of coupling capacitance of a net over all the views. <i>Return type:</i> float
<code>capacitance_min</code>	Returns the total capacitance of the net for minimum conditions. <i>Return type:</i> float
<code>coupling_capacitance_min</code>	Returns the minimum value of coupling capacitance of a net over all the views. <i>Return type:</i> float
<code>delta_delay_max</code>	Returns the delta delay for the maximum condition. <i>Return type:</i> float

<code>delta_delay_max_fall</code>	Returns the maximum falling delta delay value. <i>Return type:</i> float
<code>delta_delay_max_rise</code>	Returns the maximum rising delta delay value. <i>Return type:</i> float
<code>delta_delay_min</code>	Returns the delta delay for the minimum condition. <i>Return type:</i> float
<code>delta_delay_min_fall</code>	Returns the minimum falling delta delay value. <i>Return type:</i> float
<code>delta_delay_min_rise</code>	Returns the minimum rising delta delay value. <i>Return type:</i> float
<code>driver_pins</code>	Returns a collection of the driver pins of the net. <i>Return type:</i> collection
<code>early_fall_clk_net_derate_factor</code>	Returns the early fall clock net derating factor specified through <code>set_timing_derate</code> command. <i>Return type:</i> float
<code>early_fall_clk_net_delta_derate_factor</code>	Returns the early fall clock delta delay net derating factor specified through the <code>set_timing_derate</code> command. <i>Return type:</i> float
<code>early_fall_data_net_delta_derate_factor</code>	Returns the early fall data delta net derating factor specified through the <code>set_timing_derate</code> command. <i>Return type:</i> float
<code>early_fall_data_net_derate_factor</code>	Returns the early fall data net derating factor specified through <code>set_timing_derate</code> command. <i>Return type:</i> float
<code>early_rise_clk_net_delta_derate_factor</code>	Returns the early rise clock delta net derating factor specified through the <code>set_timing_derate</code> command. <i>Return type:</i> float

<code>early_rise_clk_net_derate_factor</code>	Returns the early rise clock net derating factor specified through the <code>set_timing_derate</code> command. <i>Return type:</i> float
<code>early_rise_data_net_delta_derate_factor</code>	Returns the early rise data delta net derating factor specified through the <code>set_timing_derate</code> command. <i>Return type:</i> float
<code>early_rise_data_net_derate_factor</code>	Returns the early rise data net derating factor specified through the <code>set_timing_derate</code> command. <i>Return type:</i> float
<code>has_detailed_parasitics</code>	Returns a value of <code>true</code> if the net, or one of its parts, has detailed parasitics associated with it from either RC extraction or SPEF annotation. <i>Return type:</i> boolean
<code>hierarchical_name</code>	Returns the complete hierarchical name of the net. <i>Return type:</i> string
<code>is_clock_source_latency</code>	Returns a value of <code>true</code> if the net is a part of clock source latency network. The clock source latency network consists of the clock network cells, its pins, and the nets connecting the master clock source pin and the generated clock source pin. For example, <code>get_property [get_nets A] is_clock_source_latency</code> <i>Return type:</i> boolean
<code>is_dont_touch</code>	Returns a value of <code>true</code> if a <code>set_dont_touch</code> constraint exists for the net. <i>Return type:</i> boolean
<code>is_hierarchical</code>	Returns a value of <code>true</code> if the net is a part of hierarchical module boundary. For example, <code>get_property [get_nets W1] is_hierarchical</code> <i>Return type:</i> boolean

<code>is_ideal</code>	Returns a value of true if <code>set_ideal_latency</code>, <code>set_ideal_transition</code>, or <code>set_ideal_network</code> constraints exist for the net. <i>Return type:</i> Boolean
<code>late_fall_clk_net_delta_derate_factor</code>	Returns the late fall clock delta net derating factor specified through the <code>set_timing_derate</code> command. <i>Return type:</i> float
<code>late_fall_clk_net_derate_factor</code>	Returns the late fall clock net derating factor specified through the <code>set_timing_derate</code> command. <i>Return type:</i> float
<code>late_fall_data_net_delta_derate_factor</code>	Returns the late fall data delta net derating factor specified through the <code>set_timing_derate</code> command. <i>Return type:</i> float
<code>late_fall_data_net_derate_factor</code>	Returns the late fall data net derating factor specified through the <code>set_timing_derate</code> command. <i>Return type:</i> float
<code>late_rise_clk_net_delta_derate_factor</code>	Returns the late rise clock delta net derating factor specified through the <code>set_timing_derate</code> command. <i>Return type:</i> float
<code>late_rise_clk_net_derate_factor</code>	Returns the late rise clock net derating factor specified through the <code>set_timing_derate</code> command. <i>Return type:</i> float
<code>late_rise_data_net_delta_derate_factor</code>	Returns the late rise data delta net derating factor specified through the <code>set_timing_derate</code> command. <i>Return type:</i> float
<code>late_rise_data_net_derate_factor</code>	Returns the late rise data net derating factor specified through the <code>set_timing_derate</code> command. <i>Return type:</i> float
<code>load_pins</code>	Returns a collection of the load pins of the net. <i>Return type:</i> collection

<code>lumped_capacitance_max</code>	Returns the maximum value of capacitance of a net based on the input library and parasitic model. <i>Return type:</i> float
<code>lumped_capacitance_min</code>	Returns the minimum value of capacitance of a net based on the input library and parasitic model. <i>Return type:</i> float
<code>lumped_resistance_max</code>	Returns the maximum resistance of the net for late path analysis. You can use <code>-index</code> to return the value for a specific view. For example, <pre>get_property [get_nets FE_SIG_N671_FE_OFCN486_ds_data_6_] lumped_resistance_max</pre> <i>Return type:</i> float
<code>lumped_resistance_min</code>	Returns the minimum resistance of the net for late path analysis. You can use <code>-index</code> to return the value for a specific view. For example, <pre>get_property [get_nets FE_SIG_N671_FE_OFCN486_ds_data_6_] lumped_resistance_min</pre> <i>Return type:</i> float
<code>name</code>	Returns the name of the net. <i>Return type:</i> string
<code>num_driver_pins</code>	Returns the number of driver pins on a net. <i>Return type:</i> integer
<code>num_load_pins</code>	Returns the number of load pins on the net. <i>Return type:</i> integer
<code>object_type</code>	Returns the object type <code>net</code>. <i>Return type:</i> string
<code>pin_capacitance_max</code>	Returns the sum of all pin capacitances of the net for maximum conditions. <i>Return type:</i> float

<code>pin_capacitance_max_fall</code>	Returns the sum of all pin capacitances of the net for the maximum value of the falling capacitance range. <i>Return type:</i> float
<code>pin_capacitance_max_rise</code>	Returns the sum of all pin capacitances of the net for the maximum value of the rising capacitance range. <i>Return type:</i> float
<code>pin_capacitance_min</code>	Returns the sum of all pin capacitances of the net for minimum conditions. <i>Return type:</i> float
Note: For all the <code>pin_capacitance_*</code> properties (described above), the pin capacitance matches with the capacitance displayed under the <code>pin_load</code> column of the <code>report_timing</code> output.	
<code>pin_capacitance_min_fall</code>	Returns the minimum fall capacitance present at the pin of a net. For example, <code>get_property [get_nets UMC/w3] pin_capacitance_min_fall</code> <i>Return type:</i> float
<code>pin_capacitance_min_rise</code>	Returns the minimum rise capacitance present at the pin of a net. For example, <code>get_property [get_nets UMC/w3] pin_capacitance_min_rise</code> <i>Return type:</i> float
<code>resistance_max</code>	Returns the maximum value of resistance of a net. <i>Return type:</i> float
<code>resistance_min</code>	Returns the minimum value of resistance of a net. <i>Return type:</i> float
<code>timing_constant</code>	Reports a constant value on the net. For example, <code>get_property [get_nets UMC/constant_net] timing_constant</code> <i>Return type:</i> string

<code>timing_constant_source</code>	Reports the source through which the timing constant is applied. For example, <pre>get_property [get_nets UMC/constant_net] timing_constant_source</pre> <i>Return type:</i> string
<code>total_capacitance_max_fall</code>	Returns the total falling capacitance of the net used for late path analysis. For example, <pre>get_property [get_nets FE_SIG_N643_ds_data_7_] total_capacitance_max_fall -view func_slow_RCMAX</pre> <i>Return type:</i> float
<code>total_capacitance_max_rise</code>	Returns the total rising capacitance of the net used for late path analysis. For example, <pre>get_property [get_nets FE_SIG_N643_ds_data_7_] total_capacitance_max_rise -view func_slow_RCMAX</pre> <i>Return type:</i> float
<code>total_capacitance_min_fall</code>	Returns the total falling capacitance of the net used for early path analysis. For example, <pre>get_property [get_nets FE_SIG_N643_ds_data_7_] total_capacitance_min_fall -view func_fast_RCMIN</pre> <i>Return type:</i> float
<code>total_capacitance_min_rise</code>	Returns the total rising capacitance of the net used for early path analysis. For example, <pre>get_property [get_nets FE_SIG_N643_ds_data_7_] total_capacitance_min_rise -view func_fast_RCMIN</pre> <i>Return type:</i> float
<code>total_lumped_capacitance_max_fall</code>	Returns the maximum value of falling capacitance of a net based on the input library and parasitic model. <i>Return type:</i> float

<code>total_lumped_capacitance_max_rise</code>	Returns the maximum value of rising capacitance of a net based on the input library and parasitic model. <i>Return type:</i> float
<code>total_lumped_capacitance_min_fall</code>	Returns the minimum value of falling capacitance of a net based on the input library and parasitic model. <i>Return type:</i> float
<code>total_lumped_capacitance_min_rise</code>	Returns the minimum value of rising capacitance of a net based on the input library and parasitic model. <i>Return type:</i> float
<code>vl_vh_analysis_status</code>	Reports the glitch analysis (VL/VH) status for a net. For example, <pre>get_property [get_nets -of [get_cells FE_SIG_C622_FE_OFCN517_digit_2_]] vl_vh_analysis_status</pre> <i>Return type:</i> string
<code>vlu_vho_analysis_status</code>	Reports the glitch analysis status for undershoot (VLU) and overshoot (VHO) glitch for a net. For example, <pre>get_property [get_nets FE_SIG_N642_ds_data_5_] vlu_vho_analysis_status</pre> <i>Return type:</i> string
<code>wire_capacitance_max</code>	Returns the wire capacitance of the net for maximum conditions. <i>Return type:</i> float
<code>wire_capacitance_max_fall</code>	Returns the wire capacitance of the net for the maximum value of the falling capacitance range. For example, <pre>get_property [get_nets FE_SIG_N643_ds_data_7_] wire_capacitance_max_fall -view func_slow_RCMAx</pre> <i>Return type:</i> float

<code>wire_capacitance_max_rise</code>	Returns the wire capacitance of the net for the maximum value of the rising capacitance range. For example, <pre>get_property [get_nets FE_SIG_N643_ds_data_7_] wire_capacitance_max_rise -view func_slow_RCMAX</pre> <i>Return type:</i> float
<code>wire_capacitance_min</code>	Returns the wire capacitance of the net for minimum conditions. <i>Return type:</i> float
<code>wire_capacitance_min_fall</code>	Returns the wire capacitance of the net for the minimum value of the falling capacitance range. For example, <pre>get_property [get_nets FE_SIG_N643_ds_data_7_] wire_capacitance_min_fall -view func_fast_RCMIN</pre> <i>Return type:</i> float
<code>wire_capacitance_min_rise</code>	Returns the wire capacitance of the net for the minimum value of the rising capacitance range. For example, <pre>get_property [get_nets FE_SIG_N643_ds_data_7_] wire_capacitance_min_rise -view func_fast_RCMIN</pre> <i>Return type:</i> float
<code>wire_lumped_capacitance_max</code>	Returns the portion of the net's total lumped capacitance which comes extracted or annotated wire lumped capacitance values. For example, <pre>get_property [get_nets FE_SIG_N643_ds_data_7_] wire_lumped_capacitance_max -view func_slow_RCMAX</pre> <i>Return type:</i> float
<code>wire_lumped_capacitance_max_fall</code>	Returns the lumped wire capacitance of the net for the maximum value of the falling capacitance range. For example, <pre>get_property [get_nets FE_SIG_N643_ds_data_7_] wire_lumped_capacitance_max_fall -view func_slow_RCMAX</pre> <i>Return type:</i> float

<code>wire_lumped_capacitance_max_rise</code>	Returns the lumped wire capacitance of the net for the maximum value of the rising capacitance range. For example, <pre>get_property [get_nets FE_SIG_N643_ds_data_7_] wire_lumped_capacitance_max_rise -view func_slow_RCMAX</pre> <i>Return type:</i> float
<code>wire_lumped_capacitance_min</code>	Returns the portion of the net's total lumped capacitance which comes extracted or annotated wire lumped capacitance values. For example, <pre>get_property [get_nets FE_SIG_N643_ds_data_7_] wire_lumped_capacitance_min -view func_fast_RCMIN</pre> <i>Return type:</i> float
<code>wire_lumped_capacitance_min_fall</code>	Returns the lumped wire capacitance of the net for the minimum value of the falling capacitance range. For example, <pre>get_property [get_nets FE_SIG_N643_ds_data_7_] wire_lumped_capacitance_min_fall -view func_fast_RCMIN</pre> <i>Return type:</i> float
<code>wire_lumped_capacitance_min_rise</code>	Returns the lumped wire capacitance of the net for the minimum value of the rising capacitance range. For example, <pre>get_property [get_nets FE_SIG_N643_ds_data_7_] wire_lumped_capacitance_min_rise -view func_fast_RCMIN</pre> <i>Return type:</i> float
<code>x_coordinate_max</code>	Returns the maximum value of the x coordinate of the net. For example, <pre>get_property [get_nets FE_SIG_N671_FE_OF486_ds_data_6_] x_coordinate_max</pre> <i>Return type:</i> float

<code>x_coordinate_min</code>	Returns the minimum value of the <code>x</code> coordinate of the net. For example, <pre>get_property [get_nets FE_SIG_N671_FE_OFCN486_ds_data_6_] x_coordinate_min</pre> <i>Return type:</i> float
<code>y_coordinate_max</code>	Returns the maximum value of the <code>y</code> coordinate of the net. For example, <pre>get_property [get_nets FE_SIG_N671_FE_OFCN486_ds_data_6_] y_coordinate_max</pre> <i>Return type:</i> float
<code>y_coordinate_min</code>	Returns the minimum value of the <code>y</code> coordinate of the net. For example, <pre>get_property [get_nets FE_SIG_N671_FE_OFCN486_ds_data_6_] y_coordinate_min</pre> <i>Return type:</i> float

PG Net Properties

<code>asserted_voltage_max</code>	Returns the maximum asserted voltage on the power ground net. <i>Return type:</i> string
<code>asserted_voltage_min</code>	Returns the minimum asserted voltage on the power ground net. <i>Return type:</i> string
<code>hierarchical_name</code>	Returns the name of the PG net connected to the corresponding PG pin. <i>Return type:</i> string For example, <pre>get_property [get_pg_nets -of_objects [get_cells iA/out_reg]] hierarchical_name get_property [get_pg_nets -of_objects [get_cells iA/out_reg] -filter "is_power == true"] hierarchical_name</pre>

is_ground	Returns a value of <code>true</code> if the PG net is a ground net. <i>Return type:</i> boolean For example, <pre>get_property [get_pg_nets -of_objects [get_cells iA/out_reg]] is_ground get_property [get_pg_nets -of_objects [get_pg_pins -of_objects [get_cells iA/out_reg]]] is_ground</pre>
is_power	Returns a value of <code>true</code> if the PG net is a power net. <i>Return type:</i> boolean For example, <pre>get_property [get_pg_nets -of_objects [get_cells iA/out_reg]] is_power get_property [get_pg_nets -of_objects [get_cells iA/out_reg] -filter "name =~ *VDD*"] is_power</pre>
is_primary	Returns a value of <code>true</code> if the PG net is primary. <pre>get_property [get_pg_nets VDD1] is_primary</pre> <i>Return type:</i> boolean
voltage_max	Returns the maximum voltage of a given PG net. This could be voltage associated with a driver term of a net, power intent or CPF, <code>related_pg_pins</code> attribute in Liberty, or the operating voltage of a power domain or system default voltage. <i>Return type:</i> float For example, <pre>get_property [get_pg_nets -of_objects [get_cells iA/out_reg]] voltage_max</pre>
voltage_min	Returns the minimum voltage of a given PG net. This could be voltage associated with a driver term of a net, power intent or CPF, <code>related_pg_pins</code> attribute in Liberty or the operating voltage of a power domain or system default voltage. <i>Return type:</i> float For example, <pre>get_property [get_pg_nets -of_objects [get_cells iA/out_reg]] voltage_min</pre>

object_type	Returns <code>pg_net</code> as the object type for a library PG pin. <i>Return type:</i> string For example, <pre>get_property [get_pg_nets -of_objects [get_cells iA/out_reg]] object_type</pre>
pg_net_group	Returns the name of the PG net group for the <code>pg_net</code> object. <pre>get_property [get_pg_nets VDDR] pg_net_group</pre> <i>Return type:</i> string
parent_pg_net	Returns a collection of a parent power net that is the net powering the power switch that drives the PG net. In case of designs that do not have any power switches powering the instances, this property will always return the net directly powering those instances. It therefore be noted that the usage of this property is more relevant for designs in which the leaf cell instances are powered through power switch cells. <i>Return type:</i> Collection For example, <pre>get_property [get_pg_nets mmu/U1/vdd] parent_pg_net get_property [get_pg_nets -of_objects [get_cells iA/pwr_swch]] parent_pg_net</pre>
top_pg_net	Returns a collection of the top most un-switched power net of the current PG net. Even in the case of a cascading of power switches present in a design, the software traces through all power switches back to the un-switched top-level primary power net. The top-most un-switched power net will be returned - switched output power net will not be returned. <i>Return type:</i> Collection For example, <pre>get_property [get_pg_nets -of_objects [get_cells iA/pwr_swch]] top_pg_net get_property [get_pg_nets -of_objects [get_pg_pins -of_objects [get_cells iA/pwr_swch]]] top_pg_net</pre>

Path Group Properties

name	Returns the name of the path group. <i>Return type:</i> string
hierarchical_name	Returns the hierarchical name of the path group. <i>Return type:</i> string
group_type	Returns the type of group, when <code>group_path</code> and <code>-name</code> , <code>-from</code> , <code>-to</code> parameters are specified for the path. For example, <pre>get_property [get_path_groups] group_type</pre> <i>Return Type:</i> string
object_type	Returns the object type <code>path_group</code> . <i>Return type:</i> string
view_name	Returns the view name for the specified internal clock group. For example, <pre>get_property [get_path_groups m_clk -include_internal_groups] view_name</pre> <i>Return type:</i> string

Pin Properties

actual_latency_early_fall_max	When specified with the <code>set_clock_latency -clock</code> parameter, worst actual early fall insertion delay in setup mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the <code>-clock</code> parameter, returns the worst actual early fall insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the <code>-view</code> parameter, returns the worst actual early fall insertion delay for the given view. <i>Return type:</i> float
-------------------------------	---

<code>actual_latency_early_fall_min</code>	When specified with the <code>set_clock_latency -clock</code> parameter the worst actual early fall insertion delay in hold mode for the specified clock at the given pin. The latency reported is ideal or propagated depending on the clock phase. When specified without the <code>-clock</code> parameter, returns the worst early fall insertion delay on the pin. If multiple clocks reach the reported latency is the worst among all the clocks. When specified with the <code>-view</code> parameter, returns the worst latency given view. <i>Return type:</i> float
<code>actual_latency_early_rise_max</code>	When specified with the <code>set_clock_latency -clock</code> parameter the worst actual early rise source insertion delay in setup mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the <code>-clock</code> parameter, returns the worst early rise source insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the <code>-view</code> parameter, returns the worst latency given view. <i>Return type:</i> float
<code>actual_latency_early_rise_min</code>	When specified with the <code>set_clock_latency -clock</code> parameter the worst actual early rise source insertion delay in hold mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the <code>-clock</code> parameter, returns the worst early rise source insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the <code>-view</code> parameter, returns the worst latency given view. <i>Return type:</i> float

actual_latency_late_fall_max	When specified with the <code>set_clock_latency -clock</code> parameter the worst actual late fall source insertion delay in setup mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the <code>-clock</code> parameter, returns the worst late fall source insertion delay on the pin. If multiple clocks are specified the reported latency is the worst among all the clocks. When specified with the <code>-view</code> parameter, returns the worst late fall source insertion delay for the given view. <i>Return type:</i> float
actual_latency_late_fall_min	When specified with the <code>set_clock_latency -clock</code> parameter, returns the worst actual late fall source insertion delay in hold mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the <code>-clock</code> parameter, returns the worst late fall source insertion delay on the pin. If multiple clocks are specified the reported latency is the worst among all the clocks. When specified with the <code>-view</code> parameter, returns the worst late fall source insertion delay for the given view. <i>Return type:</i> float
actual_latency_late_rise_max	When specified with the <code>set_clock_latency -clock</code> parameter the worst actual late rise source insertion delay in setup mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the <code>-clock</code> parameter, returns the worst late rise source insertion delay on the pin. If multiple clocks are specified the reported latency is the worst among all the clocks. When specified with the <code>-view</code> parameter, returns the worst late rise source insertion delay for the given view. <i>Return type:</i> float

actual_latency_late_rise_min	When specified with the <code>set_clock_latency -clock</code> parameter the worst actual late rise source insertion delay in hold mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the <code>-clock</code> parameter, returns the worst late rise source insertion delay on the pin. If multiple clocks are specified, the reported latency is the worst among all the clocks. When specified with the <code>-view</code> parameter, returns the worst late rise source insertion delay for the given view. <i>Return type:</i> float
arrival_clocks	Returns the data phases, clock source data phases, and latency phases for the specified pin. <i>Return type:</i> collection The following attributes support these phases: • <code>timing_property_arrival_clocks_consider_clock_source_data_phase</code> Considers the clock source data phases. • <code>timing_property_arrival_clocks_consider_data_phase</code> Considers the pure data phase. • <code>timing_property_arrival_clocks_consider_latency_phase</code> Considers the latency phase. By default, these attributes are set to <code>true</code>.
arrival_max	Returns the value of the arrival max at specified pin. You can view the arrival max through <code>report_timing</code>. For example, <pre>get_property [get_pins <pin name>] arrival_max</pre> <i>Return Type:</i> float
arrival_max_fall	Returns the arrival time for the falling transition at the max corner. <i>Return type:</i> float
arrival_max_rise	Returns the arrival time for the rising transition at the max corner. <i>Return type:</i> float
arrival_mean_max_fall	Returns the mean component of the arrival time for the falling transition at the max corner. <i>Return type:</i> float

arrival_mean_max_rise	Returns the mean component of the arrival time for the rising transition at the max corner. <i>Return type:</i> float
arrival_mean_min_fall	Returns the mean component of the arrival time for the falling transition at the min corner. <i>Return type:</i> float
arrival_mean_min_rise	Returns the mean component of the arrival time for the rising transition at the min corner. <i>Return type:</i> float
arrival_min	Returns the value of the arrival min at specified pin. You can view this through <code>report_timing</code> . For example, <pre>get_property [get_pins <pin name>] arrival_min</pre> <i>Return Type:</i> Float
arrival_min_fall	Returns the arrival time for the falling transition at the min corner. <i>Return type:</i> float
arrival_min_rise	Returns the arrival time for the rising transition at the min corner. <i>Return type:</i> float
arrival_sigma_max_fall	Returns the sigma component of the arrival time for the falling transition at the max corner. <i>Return type:</i> float
arrival_sigma_max_rise	Returns the mean component of the arrival time for the rising transition at the max corner. <i>Return type:</i> float
arrival_sigma_min_fall	Returns the sigma component of the arrival time for the falling transition at the min corner. <i>Return type:</i> float
arrival_sigma_min_rise	Returns the sigma component of the arrival time for the rising transition at the min corner. <i>Return type:</i> float

arrival_skewness_max_fall	In SOCV analysis mode, this returns the skewness value of the falling arrival time to the specified pin across all the concurrent views. <pre>get_property [get_pins cell1/ZN] arrival_skewness_max_fa</pre> <i>Return type:</i> float
arrival_skewness_max_rise	In SOCV analysis mode, this returns the skewness value of the rising arrival time to the specified pin across all the concurrent views. <pre>get_property [get_pins cell1/ZN] arrival_skewness_max_ri</pre> <i>Return type:</i> float
arrival_skewness_min_fall	In SOCV analysis mode, this returns the skewness value of the falling arrival time to the specified pin across all the concurrent views. <pre>get_property [get_pins cell1/ZN] arrival_skewness_min_fa</pre> <i>Return type:</i> float
arrival_skewness_min_rise	In SOCV analysis mode, this returns the skewness value of the rising arrival time to the specified pin across all the concurrent views. <pre>get_property [get_pins cell1/ZN] arrival_skewness_min_ri</pre> <i>Return type:</i> float
arrival_window	Returns the arrival times for the earliest and latest rising and falling transitions in timing window format. <i>Return type:</i> string
attacker_fall_slew	Returns the minimum falling slew of an attacker driver pin. For example: <pre>get_property [get_pins inst1/y] attacker_fall_slew</pre> <i>Return type:</i> float
attacker_rise_slew	Returns the minimum rising slew of an attacker driver pin. For example: <pre>get_property [get_pins inst1/y] attacker_rise_slew</pre> <i>Return type:</i> float

capacitance_max	Returns the value of the maximum pin capacitance specified for the capacitance attribute in the library for the corresponding pin. For example, <pre>get_property [get_pins <pin_name>] capacitance_max</pre> <i>Return Type:</i> float
capacitance_max_fall	Returns the maximum value of the falling capacitance range of the corresponding library pin. <i>Return type:</i> float
capacitance_max_rise	Returns the maximum value of the rising capacitance range of the corresponding library pin. <i>Return type:</i> float
capacitance_min	Returns the value of the minimum pin capacitance specified for the capacitance attribute in the library for the corresponding pin. For example, <pre>get_property [get_pins <pin_name>] capacitance_min</pre> <i>Return Type:</i> float
capacitance_min_fall	Returns the minimum value of the falling capacitance range of the corresponding library pin. <i>Return type:</i> float
capacitance_min_rise	Returns the minimum value of the rising capacitance range of the corresponding library pin. Note: For the <code>capacitance_max_*</code> and <code>capacitance_min_*</code> properties (described above), the capacitance value does not match with the <code>pin_load (report_timing -format)</code> in the timing report because pin load is a sum of all pin capacitances of a net. <i>Return type:</i> float
capture_clocks	Returns the capture clock of the pin. <pre>get_property [get_pins UC/ret_cell/Q] capture_clocks</pre> <i>Return type:</i> collection

cell_name	Returns the cell name for the corresponding pins. For example, <pre>get_property [get_pins addr4_4/A] cell_name</pre> <i>Return type:</i> string
clock_pulse_width_high	Returns the actual high pulse width for the specified pin. <pre>create_clock -name CK -period 30 -waveform {0 10} [get_p</pre> You can verify through <code>report_min_pulse_width -clock <clock_name></code> For example, <pre>get_property [get_pins <pin_name>] clock_pulse_width_high</pre> <i>Return Type:</i> float
clock_pulse_width_low	Returns the actual low pulse width for the specified pin. <pre>create_clock -name CK -period 30 -waveform {0 10} [get_p</pre> You can verify through <code>report_min_pulse_width -clock <clock_name></code> For example, <pre>get_property [get_pins <pin_name>] clock_pulse_width_low</pre> <i>Return Type:</i> float
clock_sources	Returns a collection of the source pins of all the clocks arriving <i>Return type:</i> collection
clocks	Returns a collection of all of the clocks arriving at the pin. This property will report clocks on hierarchical pins even before timing update is performed (with the <code>update_timing -full compile</code>) <i>Return type:</i> collection
constrained_capture_clocks	Returns the constrained capture clocks at the specified pin. <pre>get_property [get_pins UC/ret_cell/Q] constrained_capture_clocks</pre> <i>Return type:</i> collection
constant_value	Returns a value of 0 or 1 if a logic state has been asserted or not at the pin. <pre>get_property [get_pins RM_128x16_INST/oe] constant_value</pre> <i>Return type:</i> string

delay_max_fall	Returns the maximum falling delay - specified using the <code>set_max_fall</code> command. <i>Return type:</i> float
delay_max_rise	Returns the maximum rising delay - specified using the <code>set_max_rise</code> command. <i>Return type:</i> float
delay_min_fall	Returns the minimum falling delay - specified using the <code>set_min_fall</code> command. <i>Return type:</i> float
delay_min_rise	Returns the minimum rising delay - specified using the <code>set_min_rise</code> command. <i>Return type:</i> float
direction	Returns the direction of the pin: in, out, or inout. <i>Return type:</i> string
driver_cell	Returns the driver cell name for the corresponding pins. For example, <pre>get_property [get_pins ON28_n_17/A] driver_cell</pre> <i>Return type:</i> string
driver_cell_name	Returns the driving cell instance for the specified pin. For example, <pre>get_property [get_pins <pin name>] driver_cell_name</pre> <i>Return Type:</i> string
driver_power_pin_voltage_max	Reports the maximum power pin voltage of a driver cell. <pre>get_property [get_pins UC/mcr_cell/a] driver_power_pin_v</pre> <i>Return type:</i> float
driver_power_pin_voltage_min	Reports the minimum power pin voltage of a driver cell. <pre>get_property [get_pins UC/mcr_cell/a] driver_power_pin_voltage_min</pre> <i>Return type:</i> float

driver_ref_lib_cell_name	Returns the library defined driving cell for the specified pin. For example, <pre>get_property [get_pins <pin name>] driver_ref_lib_cell_name</pre> <i>Return Type:</i> string
escaped_name	Returns the full hierarchical name, including escaped characters. <i>Return Type:</i> string
fanin	Returns the number of sources connected with net of the specified pin. <i>Return type:</i> integer
fanout	Returns the number of sinks connected with the net of the specified pin. <i>Return type:</i> integer
fanout_load	Returns the fanout load for the pin. <i>Return type:</i> float
fastest_clock	Returns the collection of the clock name defined for the specified pin. <pre>create_generated_clock -name ck -source CK -divide_by 2</pre> For example, <pre>get_property [get_pins <pin_name>] fastest_clock</pre> <i>Return Type:</i> collection
fastest_clock_name	Returns the clock name defined for the specified pin. <pre>create_generated_clock -name clk -source CLK -multiply_by 2</pre> For example, <pre>get_property [get_pins <pin name>] fastest_clock_name</pre> <i>Return Type:</i> string

fastest_clock_period	Returns the clock period of the clock defined for the specified pin. <pre>create_clock -name CLK -period 10 -waveform {0 5} [get_pins {CK2}]</pre> <pre>create_generated_clock -name clk -source CLK</pre> <pre>-multiply_by 3 <pin name></pre> You can verify through <code>report_clocks</code>. For example, <pre>get_property [get_pins <pin_name>] fastest_clock_period</pre> <i>Return Type:</i> float
hierarchical_level	Returns the hierarchical level of the pin. For example, <pre>get_property [get_pins <pin name>] hierarchical_level</pre> <i>Return Type:</i> integer
hierarchical_name	Returns the complete hierarchical name of the pin. <i>Return type:</i> string
hold_uncertainty	Returns the most conservative uncertainty of all possible unclocked assertions associated with the pin. <i>Return type:</i> float
holding_resistance_high	Returns the highest holding resistance of a pin. For example, <pre>foreach pin \$pinList { set vicArray [get_property [get_pins \$pin] noise_victim] foreach_in_collection vic \$vicArray { get_property \$vic holding_resistance_high } }</pre> <i>Return type:</i> float
holding_resistance_low	Returns the lowest holding resistance of a pin. <i>Return type:</i> float

<code>interp_info_max</code>	Returns information for late analysis. When specified, the report output will show the data for interpolation, and/or matched information for late analysis, also the library details. <i>Return type:</i> string
<code>interp_info_min</code>	Returns information for early analysis. When specified, the report output will show the data for interpolation, and/or matched information for early analysis, also the library details. <i>Return type:</i> string
<code>is_always_on</code>	Returns a value of <code>true</code> if an instance pin is an always-on pin. <i>Return type:</i> boolean For example, <pre>get_property [get_pins mmu/U1/AON] is_always_on</pre>
<code>is_async</code>	Returns a value of <code>true</code> if the pin is an asynchronous clear or pin. <i>Return type:</i> boolean
<code>is_clear</code>	Returns a value of <code>true</code> if the pin is an asynchronous clear pin. <i>Return type:</i> boolean
<code>is_clock</code>	Returns a value of <code>true</code> if the pin has the Liberty pin attribute: <code>CLOCK</code>. <i>Return type:</i> boolean
<code>is_clock_gating</code>	Returns a value of <code>true</code> if the pin is defined as a pin of a clock gating cell. <i>Return type:</i> boolean
<code>is_clock_gating_clock</code>	Returns a value of <code>true</code> if the pin is defined as a clock pin of a clock gating cell. <i>Return type:</i> boolean
<code>is_clock_gating_enable</code>	Returns a value of <code>true</code> if the pin corresponds to the enable pin of a clock gating cell. <i>Return type:</i> boolean

is_clock_root	Returns <code>true</code> for a pin or port if real clock or generated clock is the pin/port. <pre>create_generated_clock -name clk -source CLK -multiply_b name></pre> For example, <pre>get_property [get_pins <pin_name>] is_clock_root</pre> <i>Return Type:</i> boolean
is_clock_source_pin	Returns a value of <code>true</code> for a valid instance pin or port object, if declared with that clock source at pin/port. <i>Return Type:</i> Boolean
is_clock_source_latency	Returns a value of <code>true</code> if a pin, port or any of the leaf pins of a clock source latency network. <i>Return Type:</i> Boolean
is_clock_used_as_clock	Returns a value of <code>true</code> if the pin lies in the clock network and if one of the clocks arriving at the pin is used as a clock in the downstream network of the pin. When the <code>-clock</code> parameter is specified, this property returns <code>true</code> if the above condition is satisfied for the specified clock. <i>Return type:</i> boolean
is_clock_used_as_data	Returns a value of <code>true</code> if the pin lies in the clock source path and if one of the clocks arriving on the pin is used as data in the downstream network of the pin. When the <code>-clock</code> parameter is specified, this property returns <code>true</code> if the above condition is satisfied for the specified clock. <i>Return type:</i> boolean
is_constrained	Returns a value of <code>true</code> if the specified pin is constrained. <pre>get_property [get_pins UM/A] is_constrained</pre> <i>Return type:</i> boolean
is_data	Returns a value of <code>true</code> if the pin is a data pin of a flip-flop (that is, not a clock pin). <i>Return type:</i> boolean

<code>is_disable_timing</code>	Returns a value of <code>true</code> if the pin's timing has been disabled. Return type: boolean Note: This property checks if the associated arc for the pin is a propagation and analysis. For accurate results, re-run the <code>update_timing</code> command.
<code>is_fall_edge_triggered_clock</code>	Returns a value of <code>true</code> if the pin is a clock pin of a flop, and is by the falling edge of a clock. <i>Return type:</i> boolean
<code>is_fall_edge_triggered_data</code>	Returns a value of <code>true</code> if the pin corresponds to the data pin of an edge triggered device. <i>Return value:</i> boolean
<code>is_hierarchical</code>	Returns a value of <code>true</code> if the pin is a pin of a hierarchical model. <i>Return type:</i> boolean
<code>is_isolation_cell_data</code>	Returns <code>true</code> if the instance signal pin corresponding to the <code>isolation_cell_data_pin</code> attribute of a library signal pin is set indicating that the library cell signal pin is a data pin of an isolation cell. Note : The <code>is_isolation_cell</code> attribute must be set to <code>true</code> in the library cell. For example, <pre>get_property [get_pins <pin_name>] is_isolation_cell_data</pre> <i>Return Type:</i> boolean
<code>is_isolation_cell_clock</code>	Returns <code>true</code> if the instance signal pin corresponding to the <code>isolation_cell_clock_pin</code> attribute of a library signal pin is set indicating that the library cell signal pin is a data pin of an isolation cell. Note : The <code>is_isolation_cell</code> attribute must be set to <code>true</code> in the library cell. <i>Return Type:</i> boolean

is_isolation_cell_enable	Returns <code>true</code> if the instance signal pin corresponding to the <code>isolation_cell_enable_pin</code> attribute of a library signal pin is set to <code>true</code>, indicating that the library cell signal pin is an enable or control pin of an isolation library cell. Note : The <code>is_isolation_cell</code> attribute must be set to <code>true</code> in the library cell. For example, <pre>get_property [get_pins <pin_name>] is_isolation_cell_enable</pre> <i>Return Type:</i> boolean
is_latency_network_pin	Returns <code>true</code> if the specified pin is having generated or created by a library cell. For example, <pre>create_generated_clock -name ck -source CK -divide_by 2</pre> For example, <pre>get_property [get_pins <pin name>] is_latency_network_pin</pre> <i>Return Type:</i> boolean
is_level_shifter_enable	Returns <code>true</code> if the instance signal pin corresponding to the <code>level_shifter_enable_pin</code> attribute of a library signal pin is set to <code>true</code>, indicating that the library cell signal pin is a enable pin of an is library cell. <i>Return Type:</i> boolean
is_level_shifter_data	Returns <code>true</code> if the instance signal pin corresponding to the <code>level_shifter_data_pin</code> attribute of a library signal pin is set to <code>true</code>, indicating that the library cell signal pin is a data pin of an is library cell. Note: The <code>is_level_shifter</code> attribute must be set to <code>true</code> in the library cell. For example, <pre>get_property [get_pins <pin_name>] is_level_shifter_data</pre> <i>Return Type:</i> boolean

<code>input_signal_level</code>	Returns the power rail name associated with the input signal pin if the power rail has been explicitly specified in the Liberty description of the cell. Otherwise, it returns the value of the <code>input_signal_level</code> attribute. Typically, this attribute can only be defined in overdrive situations where the expected input voltage does not match the <code>related_power_rail</code> input. In other cases, a value of NA will be returned. <i>Return type:</i> string For example, <pre>get_property [get_pins mmu/U1/I] input_signal_level</pre>
<code>input_signal_level_voltage</code>	If the <code>input_signal_level</code> has an explicit value, then this attribute returns the voltage of that power rail. This is the expected input voltage for the input pin. A value of NA will be returned if <code>input_signal_level</code> is undefined. <i>Return type:</i> float For example, <pre>get_property [get_pins mmu/U1/I] input_signal_level_voltage</pre>
<code>is_multiple_clock_fanin_point</code>	Returns a value of <code>true</code> if multiple clock phases converge at the pin. <i>Return type:</i> boolean
<code>is_mux_select_pin</code>	Returns <code>true</code> if the specified pin is the mux select pin. For example, <pre>get_property [get_pins m1/S] is_mux_select_pin</pre> <i>Return Type:</i> boolean
<code>is_negative_level_sensitive_clock</code>	Returns a value of <code>true</code> if the library pin is an enable pin of an active-low level-sensitive device. <i>Return type:</i> boolean
<code>is_negative_level_sensitive_data</code>	Returns a value of <code>true</code> if the pin is a data pin of an active-low level-sensitive device. <i>Return type:</i> boolean

<code>is_pin</code>	Returns a value of <code>true</code>. The <code>is_pin</code> and <code>is_port</code> queries are provided for both pin and objects to provide a quick way of determining the object type or identifier. <code>is_port</code> always returns <code>false</code> for pins. <code>is_pins</code> always returns <code>false</code> for ports. <i>Return type:</i> boolean
<code>is_port</code>	Returns a value of <code>false</code>. The <code>is_pin</code> and <code>is_port</code> queries are provided for both pin and objects to provide a quick way of determining the object type or identifier. <code>is_port</code> always returns <code>false</code> for pins. <code>is_pins</code> always returns <code>false</code> for ports. <i>Return type:</i> boolean
<code>is_positive_level_sensitive_clock</code>	Returns a value of <code>true</code> if the library pin is an enable pin of an level-sensitive device. <i>Return type:</i> boolean
<code>is_positive_level_sensitive_data</code>	Returns a value of <code>true</code> if the pin is a data pin of an active high sensitive device. <i>Return type:</i> boolean
<code>is_power_mode_disabled</code>	Returns a value of <code>true</code> if power mode of the specified pin is disabled. <pre>get_property [get_pins MD_C/C_IS] is_power_mode_disabled view_func_8V_OFF</pre> <i>Return type:</i> boolean
<code>is_preset</code>	Returns a value of <code>true</code> if the pin is a preset pin. <i>Return type:</i> boolean
<code>is_propagated_clock</code>	Returns a value of <code>true</code> if there is an explicit <code>set_propagated_clock</code> assertion at the pin. <i>Return type:</i> boolean

<code>is_ref_clock_pin</code>	Returns a value of <code>true</code> for: - Valid instance pin object and on an active clock pin where signal reaches, and sequential cell is not disabled by disabled arcs or case analysis. Any pin with clock check-arcs or triggers also be reported, if an active clock phase is present on that - Clock pin on an inferred clock gating cell. Returns a value of <code>false</code>, if clock propagation disabled with the <code>set_disable_timing</code> or <code>set_sense -stop_propagation</code> command. <i>Return Type:</i> Boolean
<code>is_rise_edge_triggered_clock</code>	Returns a value of <code>true</code> if the pin is a clock pin of a flop, and is by the rising edge of a clock. <i>Return type:</i> boolean
<code>is_rise_edge_triggered_data</code>	Returns a value of <code>true</code> if the pin corresponds to the data pin of edge-triggered device. <i>Return type:</i> boolean
<code>is_tristate</code>	Returns a value of <code>true</code> if the pin has the <code>three_state</code> attribute Liberty timing library. <i>Return type:</i> boolean
<code>is_tristate_enable</code>	Returns a value of <code>true</code> if the pin is the source pin of timing arc either the <code>three_state_enable</code> or <code>three_state_disable</code> attribute Liberty timing library. <i>Return type:</i> boolean
<code>is_tristate_output</code>	Returns a value of <code>true</code> if the pin corresponds to a three-state output. <i>Return type:</i> boolean
<code>latency_fall_max</code>	Returns the maximum fall insertion delay specified by an explicit <code>set_clock_latency</code> at the pin. <i>Return type:</i> float
<code>latency_fall_min</code>	Returns the minimum fall insertion delay specified by an explicit <code>set_clock_latency</code> at the pin. <i>Return type:</i> float

latency_rise_max	Returns the maximum rise insertion delay specified by an explicit <code>set_clock_latency</code> at the pin. <i>Return type:</i> float
latency_rise_min	Returns the minimum rise insertion delay specified by an explicit <code>set_clock_latency</code> at the pin. <i>Return type:</i> float
lib_pins	Returns the collection of the library pin for the specified pin. For example, <pre>get_property [get_pins <pin name>] lib_pins</pre> <i>Return Type:</i> collection
max_capacitance	Returns the maximum capacitance limit for the pin. <i>Return type:</i> float
max_fanout	Returns the maximum fanout load that the pin can drive. This value is set using <code>set_max_fanout</code> or the <code>default_max_fanout</code> library attribute. <i>Return type:</i> float
max_time_borrow	Returns the value of the maximum time borrowed for the specified pin when the <code>set_max_time_borrow</code> parameter is specified. For example, <pre>get_property [get_pins <pin name>] max_time_borrow</pre> <i>Return Type:</i> float
max_time_borrow_io	Returns the maximum time that a path arriving at a latch input can borrow from the next stage during latch-based analysis. <pre>get_property [get_pins mro_dc/LP/d] max_time_borrow_io</pre> <i>Return Type:</i> float
max_transition	Returns the maximum transition time limit specified for the pin. <i>Return type:</i> float

min_capacitance	Returns the value of the minimum capacitance for the specified pin. The <code>set_min_capacitance</code> parameter is specified. For example, <pre>get_property [get_pins <pin name>] min_capacitance</pre> <i>Return Type:</i> float
min_fanout	Returns the minimum fanout design rule limit of the corresponding pin. <i>Return type:</i> float
min_transition	Returns the value of the minimum transition for the specified pin. For example, <pre>get_property [get_pins <pin name>] min_transition</pre> <i>Return Type:</i> float
name	Returns the leaf-level name of the pin. For example, <pre>get_property [get_pins <pin name>] name</pre> <i>Return Type:</i> string
netlist_constant_value	Returns a constant logic value of 1'b0 or 1'b1 in the Verilog. <pre>get_property [get_pins UC/flp/pez] netlist_constant_value</pre>
net_name	Returns the name of the net connected to the specified pin. <i>Return type:</i> string
noise_victim	Returns a collection of <code>si_victim</code> objects that can be used to query attributes. <i>Return type:</i> collection
object_type	Returns the object type of the pin. <i>Return type:</i> string
output_signal_level	Returns the rail name of the <code>related_power_pin</code> attribute of the output/inout signal pin. <i>Return type:</i> string For example, <pre>get_property [get_pins mmu/U1/Y] output_signal_level</pre>

pin_capacitance_max	Reports the maximum capacitance of a pin. <pre>get_property [get_pins UMC/buff/A] pin_capacitance_max</pre> <i>Return type:</i> float
pin_capacitance_max_fall	Returns the maximum falling capacitance of a pin. <i>Return type:</i> float
pin_capacitance_max_rise	Returns the maximum rise capacitance of pin. <i>Return type:</i> float
pin_capacitance_min	Returns the minimum capacitance of pin. <i>Return type:</i> float
pin_capacitance_min_fall	Returns the minimum fall capacitance of Pin. <i>Return type:</i> float
pin_capacitance_min_rise	Returns the minimum rise capacitance of Pin. <i>Return type:</i> float
pin_direction	Reports the direction of a pin. <pre>get_property [get_pins UC/buf/B] pin_direction</pre> <i>Return type:</i> string
power_rail_voltage_bidir_input_max	Reports power rail voltage for input part of bidi pins/ports for maximum operating condition. <i>Return type:</i> float
power_rail_voltage_bidir_input_min	Reports power rail voltage for input part of bidi pins/ports for minimum operating condition. <i>Return type:</i> float
power_rail_voltage_max	Reports power rail voltage for maximum operating condition for bidirectional, input and output pins. For bidirectional pins, the maximum voltage for output signal is reported. <i>Return type:</i> float
power_rail_voltage_min	Reports power rail voltage for minimum operating condition for bidirectional, input and output pins. For bidirectional pins, the minimum voltage for output signal is reported. <i>Return type:</i> float

receiver_ccc_type	Returns the type of receiver cell model. The return values can single_ccc, dual_ccc, multi_ccc, or black_box. This attribute applies to receiver pins only. For example, <pre>get_property [get_pins inst1/a] receiver_ccc_type</pre> <i>Return type:</i> string
ref_lib_pin_name	Returns the name of the library pin associated with the instance. <i>Return type:</i> string
related_ground_pin	Returns the related ground pins as a collection for the corresponding instance pins. <i>Return type:</i> collection For example, <pre>get_property [get_pins mmu/U1/I] related_ground_pin</pre>
related_power_pin	Returns the related power pins as a collection for the corresponding instance pins. <i>Return type:</i> collection For example, <pre>get_property [get_pins mmu/U1/I] related_power_pin</pre>
setup_uncertainty	Returns the most conservative uncertainty of all possible uncertainty assertions associated with the pin. <i>Return type:</i> float
si_slew_max	Returns the maximum slew from all the incoming signals after SI analysis. This value is a maximum of si_slew_max_rise and si_slew_max_fall. <i>Return type:</i> float
si_slew_max_fall	Reports the maximum falling slew considering the incremental signal integrity analysis. <pre>get_property [get_pins UC/buf/A] si_slew_max_fall</pre> <i>Return type:</i> float

si_slew_max_rise	Reports the maximum rising slew considering the incremental signal integrity analysis. <pre>get_property [get_pins UC/buf/A] si_slew_max_rise</pre> <i>Return type:</i> float
si_slew_min_fall	Reports the minimum falling slew considering the incremental signal integrity analysis. <pre>get_property [get_pins UC/buf/A] si_slew_min_fall</pre> <i>Return type:</i> float
si_slew_min_rise	Reports the minimum rising slew considering the incremental signal integrity analysis. <pre>get_property [get_pins UC/buf/A] si_slew_min_rise</pre> <i>Return type:</i> float
si_slew_mean_max_fall	Returns the mean component of maximum falling slew from the signals after SI analysis is performed. <i>Return type:</i> float
si_slew_mean_max_rise	Returns the mean component of maximum rising slew from the signals after SI analysis is performed. <i>Return type:</i> float
si_slew_mean_min_fall	Returns the mean component of minimum falling slew from the signals after SI analysis is performed. <i>Return type:</i> float
si_slew_mean_min_rise	Returns the mean component of minimum rising slew from the signals after SI analysis is performed. <i>Return type:</i> float
si_slew_min	Returns the minimum slew from all the incoming signals after SI analysis. This value is a minimum of <code>si_slew_min_rise</code> and <code>si_slew_min_fall</code>. <i>Return type:</i> float
si_victim	Returns a collection of the <code>si_victim</code> objects that can be used graph-based SI delay attributes. <i>Return type:</i> collection

slack_max	Returns the slack maximum property for a timing path. <i>Return type:</i> float
slack_max_edge	Returns the edge (rise or fall) of the worst slack-causing path at a specified pin in late mode. <i>Return type:</i> string
slack_max_fall	Returns the slack time for the falling transition at the max corner. <i>Return type:</i> float
slack_max_rise	Returns the slack time for the rising transition at the max corner. When the <code>-view</code> parameter is not specified, the worst slack for all views is returned. <i>Return type:</i> float
slack_mean_max	Returns the maximum mean component of the slack time for a path. <i>Return type:</i> float
slack_mean_min	Returns the minimum mean component of the slack time for a path. <i>Return type:</i> float
slack_mean_max_fall	Returns the mean component of the slack time for the falling transition at the max corner. <i>Return type:</i> float
slack_mean_max_rise	Returns the mean component of the slack time for the rising transition at the max corner. <i>Return type:</i> float
slack_mean_min_fall	Returns the mean component of the slack time for the falling transition at the min corner. <i>Return type:</i> float
slack_mean_min_rise	Returns the mean component of the slack time for the rising transition at the min corner. <i>Return type:</i> float
slack_min	Returns the slack time for a timing path at the min corner. <i>Return type:</i> float

slack_min_edge	Returns the edge (rise or fall) of the worst slack-causing path at a specified pin in early mode. <i>Return type:</i> string
slack_min_fall	Returns the slack time for the falling transition at the min corner. <i>Return type:</i> float
slack_sigma_max	Returns the variation component of the worst slack across all timing concurrent MMMC views for Setup-style late data path checks. <code>get_property [get_pins dff1/Q] slack_sigma_max</code> <i>Return type:</i> float
slack_sigma_min	Returns the variation component of the worst slack across all timing concurrent MMMC views for Hold-style early data path checks. <code>get_property [get_pins dff1/Q] slack_sigma_min</code> <i>Return type:</i> float
slack_min_rise	Returns the slack time for the rising transition at the min corner. <i>Return type:</i> float
slack_skewness_max_fall	Returns the skewness component of the worst falling slack across concurrent MMMC views for Setup-style late data path checks. <code>get_property [get_pins df1/Q] slack_skewness_max_fall</code> <i>Return type:</i> float
slack_skewness_max_rise	Returns the skewness component of the worst rising slack across concurrent MMMC views for Setup-style late data path checks. <code>get_property [get_pins df1/Q] slack_skewness_max_rise</code> <i>Return type:</i> float
slack_skewness_min_fall	Returns the skewness component of the worst falling slack across concurrent MMMC views for Hold-style early data path checks. <code>get_property [get_pins df1/Q] slack_skewness_min_fall</code> <i>Return type:</i> float
slack_skewness_min_rise	Returns the skewness component of the worst rising slack across concurrent MMMC views for Hold-style early data path checks. <code>get_property [get_pins df1/Q] slack_skewness_min_rise</code> <i>Return type:</i> float

slack_sigma_max_fall	Returns the sigma component of the slack time for the falling transition at the max corner. <i>Return type:</i> float
slack_sigma_max_rise	Returns the sigma component of the slack time for the rising transition at the max corner. <i>Return type:</i> float
slack_sigma_min_fall	Returns the sigma component of the slack time for the falling transition at the min corner. <i>Return type:</i> float
slack_sigma_min_rise	Returns the sigma component of the slack time for the rising transition at the min corner. <i>Return type:</i> float
slew_max	Returns the value of the maximum slew for the specified pin. You can verify through <code>report_timing</code> . For example, <code>get_property [get_pins <pin name>] slew_max</code> <i>Return Type:</i> float
slew_max_fall	Returns the slew time for the falling transition at the max corner. <i>Return type:</i> float
slew_max_rise	Returns the slew time for the rising transition at the max corner. <i>Return type:</i> float
slew_mean_max_fall	Returns the mean component of the slew time for the falling transition at the max corner. <i>Return type:</i> float
slew_mean_max_rise	Returns the mean component of the slew time for the rising transition at the max corner. <i>Return type:</i> float
slew_mean_min_fall	Returns the mean component of the slew time for the falling transition at the min corner. <i>Return type:</i> float

slew_mean_min_rise	Returns the mean component of the slew time for the rising transition at the min corner. <i>Return type:</i> float
slew_min	Returns the value of the minimum slew for the specified pin. You can verify through <code>report_timing</code>. For example, <pre>get_property [get_pins <pin name>] slew_min</pre> <i>Return Type:</i> float
slew_min_fall	Returns the slew time for the falling transition at the min corner. <i>Return type:</i> float
slew_min_rise	Returns the slew time for the rising transition at the min corner. <i>Return type:</i> float
slew_sigma_max_fall	Returns the sigma component of the slew time for the falling transition at the max corner. <i>Return type:</i> float
slew_sigma_max_rise	Returns the sigma component of the slew time for the rising transition at the max corner. <i>Return type:</i> float
slew_sigma_min_fall	Returns the sigma component of the slew time for the falling transition at the min corner. <i>Return type:</i> float
slew_sigma_min_rise	Returns the sigma component of the slew time for the rising transition at the min corner. <i>Return type:</i> float
slew_skewness_max_fall	Returns the skewness component of the maximum slew time for all transitions across all the concurrent MMMC views. <pre>get_property [get_pins UMC/buff/A] slew_skewness_max_fall</pre> <i>Return type:</i> float

slew_skewness_max_rise	Returns the skewness component of the maximum slew time for transitions across all the concurrent MMMC views. <pre>get_property [get_pins UMC/buff/A] slew_skewness_max_rise</pre> <i>Return type:</i> float
slew_skewness_min_fall	Returns the variation component of the minimum slew time for transitions across all the concurrent MMMC views. <pre>get_property [get_pins UMC/buff/A] slew_skewness_min_fall</pre> <i>Return type:</i> float
slew_skewness_min_rise	Returns the variation component of the minimum slew time for transitions across all the concurrent MMMC views. <pre>get_property [get_pins UMC/buff/A] slew_skewness_min_rise</pre> <i>Return type:</i> float
source_latency_early_fall_max	Returns the maximum early fall source insertion delay specified explicit set_clock_latency at the pin. <i>Return type:</i> float
source_latency_early_fall_min	Returns the minimum early fall source insertion delay specified explicit set_clock_latency at the pin. <i>Return type:</i> float
source_latency_early_rise_max	Returns the maximum early rise source insertion delay specified explicit set_clock_latency at the pin. <i>Return type:</i> float
source_latency_early_rise_min	Returns the minimum early rise source insertion delay specified explicit set_clock_latency at the pin. <i>Return type:</i> float
source_latency_late_fall_max	Returns the maximum late fall source insertion delay specified explicit set_clock_latency at the pin. <i>Return type:</i> float
source_latency_late_fall_min	Returns the minimum late fall source insertion delay specified explicit set_clock_latency at the pin. <i>Return type:</i> float

source_latency_late_rise_max	Returns the maximum late rise source insertion delay specified explicit <code>set_clock_latency</code> at the pin. <i>Return type:</i> float
source_latency_late_rise_min	Returns the minimum late rise source insertion delay specified explicit <code>set_clock_latency</code> at the pin. <i>Return type:</i> float
stolen_slack	Returns the slack stolen at the specified pin. This property can only for pins in late mode. Note: The specified pin must be the endpoint of a transparent arc. <i>Return type:</i> float
timing_constant	Reports the constant value specified on a pin. <code>get_property [get_pins UC/retent_cell/SZ] timing_constant</code> <i>Return type:</i> string
timing_constant_source	Reports the source from which the timing constant was applied. <code>get_property [get_pins UC/retent_cell/SZ] timing_constant_source</code> <i>Return type:</i> string
user_constant_value	Returns the constant values from constraints for the specified pin. <code>get_property [get_pins UC/retent_cell/SZ] user_constant_value</code> <i>Return type:</i> integer
waveform_max_fall	Returns the fall waveform for the specified input pins during late analysis. <i>Return type:</i> string
waveform_max_rise	Returns the rise waveform for the specified input pins during late analysis. <i>Return type:</i> string
waveform_min_fall	Returns the fall waveform for the specified input pins during early analysis. <i>Return type:</i> string
waveform_min_rise	Returns the rise waveform for the specified input pins during early analysis. <i>Return type:</i> string

x_coordinate	Returns the x coordinates of the placed pin. <i>Return type:</i> float
y_coordinate	Returns the y coordinates of the placed pin. <i>Return type:</i> float

PG Pin Properties

hierarchical_name	Returns the complete hierarchical name of the PG pin. <i>Return type:</i> string For example, <pre>get_property [get_pg_pins -of_objects [get_cells iA/out_reg]] hierarchical_name get_property [get_pg_pins -of_objects [get_cells iA/out_reg] -filter "pg_type == primary_power"] hierarchical_name</pre>
net	Returns the immediate PG net(s) connected to the corresponding PG pin objects, as a collection. <i>Return type:</i> Collection For example, <pre>get_property [get_pg_pins -of_objects [get_cells iA/out_reg]] net</pre>
object_type	Returns pg_pin as the object type for a PG pin. <i>Return type:</i> string
pg_type	Returns the type of PG pin. <i>Return type:</i> string For example, <pre>get_property [get_pg_pins -of_objects [get_cells iA/out_reg]] pg_type get_property [get_pg_pins -of_objects [get_cells iA/out_reg] -filter "hierarchical_name =~ *VDD*"] pg_type</pre>
ref_lib_pin_name	Returns the name of the library PG pin associated with an instance PG pin. <i>Return type:</i> string For example, <pre>get_property [get_pg_pins -of_objects [get_cells iA/out_reg]] ref_lib_pin_name</pre>

voltage_max	Returns the maximum voltage of a given PG pin. This could be the voltage associated with a pin, power intent or CPF, <code>related_pg_pins</code> attribute in Liberty, or the operating voltage of a power domain or system default voltage. <i>Return type:</i> float For example, <pre>get_property [get_pg_pins -of_objects [get_cells iA/out_reg]] voltage_max</pre>
voltage_min	Returns the minimum voltage of a given PG pin. This voltage may be associated with a pin, power intent or CPF, <code>related_pg_pins</code> attribute in Liberty, or the operating voltage of a power domain or system default voltage. <i>Return type:</i> float For example, <pre>get_property [get_pg_pins -of_objects [get_cells iA/out_reg]] voltage_min</pre>

Port Properties

actual_latency_early_fall_max	Returns the maximum fall latency on the specified port caused due to source and network latency asserted using the <code>set_clock_latency</code> command for early analysis. <pre>get_property [get_ports CLK] actual_latency_early_fall_max</pre> <i>Return type:</i> float
actual_latency_early_fall_min	Returns the minimum fall latency on the specified port caused due to source and network latency asserted using the <code>set_clock_latency</code> command for early analysis. <pre>get_property [get_ports CLK] actual_latency_early_fall_min</pre> <i>Return type:</i> float

actual_latency_early_rise_max	Returns the maximum rise latency on the specified port caused due to source and network latency asserted using the <code>set_clock_latency</code> command for early analysis. <pre>get_property [get_ports CLK] actual_latency_early_rise_max</pre> <i>Return type:</i> float
actual_latency_early_rise_min	Returns the minimum rise latency on the specified port caused due to source and network latency asserted using the <code>set_clock_latency</code> command for early analysis. <pre>get_property [get_ports CLK] actual_latency_early_rise_min</pre> <i>Return type:</i> float
actual_latency_late_fall_max	Returns the maximum fall latency on the specified port caused due to source and network latency asserted using the <code>set_clock_latency</code> command for late analysis. <pre>get_property [get_ports CLK] actual_latency_late_fall_max</pre> <i>Return type:</i> float
actual_latency_late_fall_min	Returns the minimum fall latency on the specified port caused due to source and network latency asserted using the <code>set_clock_latency</code> command for late analysis. <pre>get_property [get_ports CLK] actual_latency_late_fall_min</pre> <i>Return type:</i> float
actual_latency_late_rise_max	Returns the maximum rise latency on the specified port caused due to source and network latency asserted using the <code>set_clock_latency</code> command for late analysis. <pre>get_property [get_ports CLK] actual_latency_late_rise_max</pre> <i>Return type:</i> float

actual_latency_late_rise_min	Returns the minimum rise latency on the specified port caused due to source and network latency asserted using the <code>set_clock_latency</code> command for late analysis. <pre>get_property [get_ports CLK] actual_latency_late_rise_min</pre> <i>Return type:</i> float
aocv_early_input_stage_weight	Returns the input stage weight of the specified port for AOCV mode early analysis. <pre>get_property [get_ports int] aocv_early_input_stage_weight</pre> <i>Return type:</i> float
aocv_early_output_stage_weight	Returns the output stage weight of the specified port for AOCV mode late analysis. <pre>get_property [get_ports vcop] aocv_early_output_stage_weight</pre> <i>Return type:</i> float
aocv_late_input_stage_weight	Returns the input stage weight of the specified for AOCV mode late analysis. <pre>get_property [get_ports int] aocv_late_input_stage_weight</pre> <i>Return type:</i> float
aocv_late_output_stage_weight	Returns the output stage weight of the specified port for AOCV mode late analysis. <pre>get_property [get_ports vcop] aocv_late_output_stage_weight</pre> <i>Return type:</i> float
arrival_clocks	Reports clocks that correspond to the arrival times at the port. <pre>get_property [get_ports out] arrival_clocks</pre> <i>Return type:</i> collection
arrival_max	Reports the maximum arrival time at a port. <pre>get_property [get_ports out] arrival_max</pre> <i>Return type:</i> float

arrival_max_fall	Returns the worst arrival on the port for a falling signal. <i>Return type:</i> float
arrival_max_rise	Returns the worst arrival on the port for a rising signal. <i>Return type:</i> float
arrival_mean_max_fall	In SOCV analysis mode, this returns the mean value of the latest falling arrival time to the specified port across all concurrent MMMC views. get_property [get_ports out] arrival_mean_max_fall <i>Return type:</i> float
arrival_mean_max_rise	In SOCV analysis mode, this returns the mean value of the latest rising arrival time to the specified port across all concurrent MMMC views. get_property [get_ports out] arrival_mean_max_rise <i>Return type:</i> float
arrival_mean_min_fall	In SOCV analysis mode, this returns the mean value of the earliest falling arrival time to the specified port across all concurrent MMMC views. get_property [get_ports out] arrival_mean_min_fall <i>Return type:</i> float
arrival_mean_min_rise	In SOCV analysis mode, this returns the mean value of the earliest rising arrival time to the specified port across all concurrent MMMC views. get_property [get_ports out] arrival_mean_min_rise <i>Return type:</i> float
arrival_min	Reports minimum arrival time at the port. get_property [get_ports out] arrival_min <i>Return type:</i> float
arrival_min_fall	Returns the best arrival on the port for a falling signal. <i>Return type:</i> float
arrival_min_rise	Returns the best arrival on the port for a rising signal. <i>Return type:</i> float

arrival_sigma_max_fall	In SOCV analysis mode, this returns the variation component of the latest falling arrival time to the specified port across all the concurrent MMMC views. <pre>get_property [get_ports out] arrival_sigma_max_fall</pre> <i>Return type:</i> float
arrival_sigma_max_rise	In SOCV analysis mode, this returns the variation component of the latest rising arrival time to the specified port across all the concurrent MMMC views. <pre>get_property [get_ports out] arrival_sigma_max_rise</pre> <i>Return type:</i> float
arrival_sigma_min_fall	In SOCV analysis mode, this returns the variation component of the earliest falling arrival time to the specified port across all the concurrent MMMC views. <pre>get_property [get_ports out] arrival_sigma_min_fall</pre> <i>Return type:</i> float
arrival_sigma_min_rise	In SOCV analysis mode, this returns the variation component of the earliest rising arrival time to the specified port across all the concurrent MMMC views. <pre>get_property [get_ports out] arrival_sigma_min_rise</pre> <i>Return type:</i> float
attacker_fall_slew	Reports fall slew of attackers seen for nets connected to the port. <pre>get_property [get_ports CLK] attacker_fall_slew</pre> <i>Return type:</i> float
attacker_rise_slew	Reports the rise slew of attackers seen for nets connected to the port. <pre>get_property [get_ports CLK] attacker_rise_slew</pre> <i>Return type:</i> float
arrival_window	Returns the arrival times for the earliest and latest rising and falling transitions in timing window format. <i>Return type:</i> string
capture_clocks	Reports capture clocks at the port. <i>Return type:</i> collection

clock_sources	Returns a collection of the source pins of all the clocks arriving at the port. <i>Return type:</i> collection
clocks	Returns a collection of all of the clocks arriving at the port. <i>Return type:</i> collection
constant_value	Returns a constant value of 0 or 1, if a logic state has been asserted or propagated to the port. <code>get_property [get_ports D] constant_value</code> <i>Return type:</i> integer
constrained_capture_clocks	Returns the capture clocks, which are constrained, at the port. <code>get_property [get_ports C] constrained_capture_clocks</code> <i>Return type:</i> collection
capacitance_max	Returns the maximum pin capacitance for the port. <i>Return type:</i> float
capacitance_min	Returns the minimum pin capacitance for the port. <i>Return type:</i> float
delay_max_fall	Returns the maximum falling delay value for the port. <i>Return type:</i> float
delay_max_rise	Returns the maximum rising delay value for the port. <i>Return type:</i> float
delay_min_fall	Returns the minimum falling delay value for the port. <i>Return type:</i> float
delay_min_rise	Returns the minimum rising delay value for the port. <i>Return type:</i> float
direction	Returns the direction of the port: <code>in</code> , <code>out</code> , or <code>inout</code> . <i>Return type:</i> string

driving_cell_no_design_rule	Returns a value of <code>true</code> if there is no design rule transfer from the driving cell set on a port. For example, if a driving cell is defined with the following command, then this property will return <code>true</code>: <pre>set_driving_cell -lib_cell <lib_cell_name> -no_design_rule <port></pre>
drive_resistance_fall_max	Returns the falling linear drive resistance at the port for the max condition. <i>Return type:</i> float
drive_resistance_fall_min	Returns the falling linear drive resistance at the port for the min condition. <i>Return type:</i> float
drive_resistance_rise_max	Returns the rising linear drive resistance at the port for the max condition. <i>Return type:</i> float
drive_resistance_rise_min	Returns the rising linear drive resistance at the port for the min condition. <i>Return type:</i> float
driving_cell_fall_max	Returns the name of the library cell used to compute max falling delays and transitions at the port. <i>Return type:</i> string
driving_cell_fall_min	Returns the name of the library cell used to compute min falling delays and transitions at the port. <i>Return type:</i> string
driving_cell_from_pin_fall_max	Returns the input pin of the driving cell used in the max fall delay calculation at the port. <i>Return type:</i> string
driving_cell_from_pin_fall_min	Returns the input pin of the driving cell used in the min fall delay calculation at the port. <i>Return type:</i> string

<code>driving_cell_from_pin_rise_max</code>	Returns the input pin of the driving cell used in max rise delay calculation at the port. <i>Return type:</i> string
<code>driving_cell_from_pin_rise_min</code>	Returns the input pin of the driving cell used in min rise delay calculation at the port. <i>Return type:</i> string
<code>driving_cell_library_fall_max</code>	Returns the name of the library used to compute max falling delays and transitions at the port. <i>Return type:</i> string
<code>driving_cell_library_fall_min</code>	Returns the name of the library used to compute min falling delays and transitions at the port. <i>Return type:</i> string
<code>driving_cell_library_rise_max</code>	Returns the name of the library used to compute max rising delays and transitions at the port. <i>Return type:</i> string
<code>driving_cell_library_rise_min</code>	Returns the name of the library used to compute min rising delays and transitions at the port. <i>Return type:</i> string
<code>driving_cell_max_fall_itrans_fall</code>	Returns the falling input transition of the <code>from_pin</code> of the driving cell, which is used for the max falling delay calculation at the port. <i>Return type:</i> float
<code>driving_cell_max_fall_itrans_rise</code>	Returns the falling input transition of the <code>from_pin</code> of the driving cell, which is used for the max rising delay calculation at the port. <i>Return type:</i> float
<code>driving_cell_max_rise_itrans_fall</code>	Returns the rising input transition of the <code>from_pin</code> of the driving cell, which is used for the max falling delay calculation at the port. <i>Return type:</i> float

<code>driving_cell_max_rise_itrans_rise</code>	Returns the rising input transition of the <code>from_pin</code> of the driving cell, which is used for the max rising delay calculation at the port. <i>Return type:</i> float
<code>driving_cell_min_fall_itrans_fall</code>	Returns the falling input transition of the <code>from_pin</code> of the driving cell, which is used for the min falling delay calculation at the port. <i>Return type:</i> float
<code>driving_cell_min_fall_itrans_rise</code>	Returns the falling input transition of the <code>from_pin</code> of the driving cell, which is used for the min rising delay calculation at the port. <i>Return type:</i> float
<code>driving_cell_min_rise_itrans_fall</code>	Returns the rising input transition of the <code>from_pin</code> of the driving cell, which is used for the min falling delay calculation at the port. <i>Return type:</i> float
<code>driving_cell_min_rise_itrans_rise</code>	Returns the rising input transition of the <code>from_pin</code> of the driving cell, which is used for the min rising delay calculation at the port. <i>Return type:</i> float
<code>driving_cell_pin_fall_max</code>	Returns the name of the output pin used for max fall delay calculation at the port. <i>Return type:</i> string
<code>driving_cell_pin_fall_min</code>	Returns the name of the output pin used for min fall delay calculation at the port. <i>Return type:</i> string
<code>driving_cell_pin_rise_max</code>	Returns the name of the output pin used for max rise delay calculation at the port. <i>Return type:</i> string
<code>driving_cell_pin_rise_min</code>	Returns the name of the output pin used for min rise delay calculation at the port. <i>Return type:</i> string

driving_cell_rise_max	Returns the name of the library cell used to compute max rising delays and transitions at the port. <i>Return type:</i> string
driving_cell_rise_min	Returns the name of the library cell used to compute min rising delays and transitions at the port. <i>Return type:</i> string
fanin	Returns the number of sources connected with net of the specified port. <i>Return type:</i> integer
fanout	Returns the number of sinks connected with the net of the specified port. <i>Return type:</i> integer
fanout_load	Returns the fanout load for ports. (For input ports, the value is the sum of all fanout loads of all connected pins. For output ports, the value is set using <code>set_fanout_load</code>.) <i>Return type:</i> float
fastest_clock	Reports the clock with maximum frequency associated with the port. <code>get_property [get_ports CLK] fastest_clock</code> <i>Return type:</i> collection
fastest_clock_name	Reports the name of the clock with maximum frequency associated with the port. <code>get_property [get_ports CLK] fastest_clock_name</code> <i>Return type:</i> string
fastest_clock_period	Reports the period of the clock with maximum frequency associated with the port. <code>get_property [get_ports CLK] fastest_clock_period</code> <i>Return type:</i> float
hierarchical_level	Returns the hierarchical level for an instance port. <code>get_property [get_ports C] hierarchical_level</code> <i>Return type:</i> integer

hierarchical_name	Returns the complete hierarchical name of the port. <i>Return type:</i> string
hold_uncertainty	Returns the most conservative uncertainty of all possible uncertainty assertions associated with the port. <i>Return type:</i> float
input_slew_max_fall	Returns the max falling slew for the input or inout ports. (This value is set with the <code>set_input_transition</code> command.) <i>Return type:</i> float
input_slew_max_rise	Returns the max rising slew for the input or inout ports. (This value is set with the <code>set_input_transition</code> command.) <i>Return type:</i> float
input_slew_min_fall	Returns the min falling slew for the input or inout ports. (This value is set with the <code>set_input_transition</code> command.) <i>Return type:</i> float
input_slew_min_rise	Returns the min rising slew for the input or inout ports. (This value is set with the <code>set_input_transition</code> command.) <i>Return type:</i> float
is_clock_root	Returns a value of <code>true</code> if a real or generated clock is defined on a port. <code>get_property [get_ports CLK] is_clock_root</code> <i>Return type:</i> boolean
is_clock_source_latency	Returns a value of <code>true</code> if the object is a part of the latency network. <code>get_property [get_ports C] is_clock_source_latency</code> <i>Return type:</i>
is_clock_source_pin	Returns a value of <code>true</code> if the object is a clock source pin. <code>get_property [get_ports C] is_clock_source_pin</code> <i>Return type:</i> boolean

<code>is_clock_used_as_clock</code>	Returns a value of <code>true</code> if the port lies in the clock network and at least one of the clocks arriving at the pin is used as a clock in the downstream network of the port. <pre>get_property [get_ports C] is_clock_used_as_clock</pre> <i>Return type:</i> boolean
<code>is_clock_used_as_data</code>	Returns a value of <code>true</code> if the port lies in the clock source path and at least one of the clocks arriving on the port is used as data in the downstream network of port. <pre>get_property [get_ports C] is_clock_used_as_data</pre> <i>Return type:</i> boolean
<code>is_clock_network_port</code>	Returns a value of <code>true</code> if a port is part of the clock network. <i>Return type:</i> boolean
<code>is_constrained</code>	Returns a value of <code>true</code> if the specified port is constrained. <pre>get_property [get_ports Ip] is_constrained</pre> <i>Return type:</i> boolean
<code>is_disable_timing</code>	Returns a value of <code>true</code> if the timing of the port has been disabled using the <code>set_disable_timing</code> command. <i>Return type:</i> boolean
<code>is_hierarchical</code>	Returns a value of <code>true</code> if the port is a port of a hierarchical module. <i>Return type:</i> boolean
<code>is_latency_network_pin</code>	Returns a value of <code>true</code> if the specified port has a generated clock. <pre>get_property [get_ports CLK] is_latency_network_pin</pre> <i>Return type:</i> boolean
<code>is_pin</code>	Returns a value of <code>true</code> for pin objects and <code>false</code> for port objects. <i>Return type:</i> boolean
<code>is_port</code>	Returns a value of <code>true</code> for port objects and <code>false</code> for pin objects. <i>Return type:</i> boolean

is_power_mode_disabled	Returns a value of <code>true</code> if power mode of the specified port is disabled. <pre>get_property [get_ports B_OFF] is_power_mode_disabled - view view_func_18V_OFF</pre> <i>Return type:</i> boolean
is_propagated_clock	Returns a value of <code>true</code> if there is an explicit <code>set_propagated_clock</code> assertion at the port. <i>Return type:</i> boolean
latency_fall_max	Returns the maximum fall insertion delay specified by an explicit <code>set_clock_latency</code> at the port. <i>Return type:</i> float
latency_fall_min	Returns the minimum fall insertion delay specified by an explicit <code>set_clock_latency</code> at the port. <i>Return type:</i> float
latency_rise_max	Returns the maximum rise insertion delay specified by an explicit <code>set_clock_latency</code> at the port. <i>Return type:</i> float
latency_rise_min	Returns the minimum rise insertion delay specified by an explicit <code>set_clock_latency</code> at the port. <i>Return type:</i> float
max_capacitance	Returns the maximum capacitance limit asserted on the specified port. <pre>get_property [get_ports Zf] max_capacitance</pre> <i>Return type:</i> float
max_fanout	Returns the maximum fanout load that the port can drive. (This value is set using <code>set_max_fanout</code>, or the <code>default_max_fanout</code> library attribute.) <i>Return type:</i> float
max_transition	Returns the maximum transition time limit specified for the port. <i>Return type:</i> float

netlist_constant_value	Returns a value if the port has a constant logic value of 1'b0 or 1'b1 in the Verilog. <pre>get_property [get_ports constant] netlist_constant_value</pre> <i>Return type:</i> string
net_name	Returns the name of the net connected to the specified port. <i>Return type:</i> string
noise_victim	Returns a collection of <code>si_victim</code> objects that can be used to query glitch attributes. <i>Return type:</i> collection
object_type	Returns the object type <code>port</code>. <i>Return type:</i> string
power_rail_voltage_max	Reports power rail voltage for maximum operating condition for bidirectional, input and output pins. <pre>get_property [get_ports in] power_rail_voltage_max - view Setup_m3C</pre> <i>Return type:</i> float
power_rail_voltage_min	Reports power rail voltage for minimum operating condition for bidirectional, input and output pins. <pre>get_property [get_ports in] power_rail_voltage_min - view Hold_m3C</pre> <i>Return type:</i> float
setup_uncertainty	Returns the most conservative uncertainty of all possible uncertainty assertions associated with the port. <i>Return type:</i> float
si_victim	Returns a collection of the <code>si_victim</code> objects that can be used to query graph-based SI delay attributes. <i>Return type:</i> collection

slack_max	Returns the worst slack across all the concurrent MMMC views for setup style late data path checks. For example, <pre>get_property [get_ports clk_en] slack_max</pre> <i>Return type:</i> float
slack_max_edge	Returns the edge (rise or fall) of the worst slack-causing path at the specified port in late mode. <i>Return type:</i> string
slack_max_fall	Returns the worst setup slack for a falling signal at the port endpoint. <i>Return type:</i> float
slack_max_rise	Returns the worst setup slack for a rising signal at the port endpoint. When the <code>-view</code> parameter is not specified, the worst slack for all the views is returned. <i>Return type:</i> float
slack_mean_max	In SOCV analysis, it will return the mean component of the worst slack across all concurrent MMMC views for setup-style late data path checks. For example, <pre>get_property [get_ports clk_en] slack_mean_max</pre> <i>Return type:</i> float
slack_mean_max_fall	Returns the mean component of the worst setup slack for a falling signal at the port endpoint. For example, <pre>get_property [get_ports scan_clk] slack_mean_max_fall</pre> <i>Return type:</i> float
slack_mean_max_rise	Returns the mean component of the worst setup slack for a rising signal at the port endpoint. For example, <pre>get_property [get_ports scan_clk] slack_mean_max_rise</pre> <i>Return type:</i> float

slack_mean_min	Returns the mean component of the worst hold slack at the port endpoint. For example, <pre>get_property [get_ports clk_en] slack_mean_min</pre> <i>Return type:</i> float
slack_mean_min_fall	Returns the mean component of the worst hold slack for a falling signal at the port endpoint. For example, <pre>get_property [get_ports clk_en] slack_mean_min_fall</pre> <i>Return type:</i> float
slack_mean_min_rise	Returns the mean component of the worst hold slack for a rising signal at the port endpoint. For example, <pre>get_property [get_ports clk_en] slack_mean_min_rise</pre> <i>Return type:</i> float
slack_min	Returns the worst hold slack at the port endpoint. For example, <pre>get_property [get_ports clk_en] slack_min</pre> <i>Return type:</i> float
slack_min_edge	Returns the edge (rise or fall) of the worst slack-causing path at the specified port in early mode. <i>Return type:</i> string
slack_min_fall	Returns the worst hold slack for a falling signal at the port endpoint. <i>Return type:</i> float
slack_min_rise	Returns the worst hold slack for a rising signal at the port endpoint. <i>Return type:</i> float

slew_max	Returns the maximum slew from all of the incoming signals on the port. For example, <pre>get_property [get_ports ahbsi_out[402]] slew_max</pre> <i>Return type:</i> float
slew_max_fall	Returns the maximum falling slew from all of the incoming signals on the port. <i>Return type:</i> float
slew_max_rise	Returns the maximum rising slew from all of the incoming signals on the port. <i>Return type:</i> float
slew_mean_max_fall	Returns the mean component of the maximum falling slew from all of the incoming signals on the port. For example, <pre>get_property [get_ports ahbsi_out[402]] slew_mean_max_fall</pre> <i>Return type:</i> float
slew_mean_max_rise	Returns the mean component of the maximum rising slew from all of the incoming signals on the port. For example, <pre>get_property [get_ports ahbsi_out[407]] slew_mean_max_rise</pre> <i>Return type:</i> float
slew_mean_min_fall	Returns the mean component of the minimum falling slew from all of the incoming signals on the port. For example, <pre>get_property [get_ports BG_scan_out_3] slew_mean_min_fall</pre> <i>Return type:</i> float

slew_mean_min_rise	Returns the mean component of the minimum rising slew from all of the incoming signals on the port. For example, <pre>get_property [get_ports BG_scan_out_3] slew_mean_min_rise</pre> <i>Return type:</i> float
slew_min	Returns the minimum slew from all of the incoming signals on the port. For example, <pre>get_property [get_ports BG_scan_out_3] slew_min</pre> <i>Return type:</i> float
slew_min_fall	Returns the minimum falling slew from all of the incoming signals on the port. <i>Return type:</i> float
slew_min_rise	Returns the minimum rising slew from all of the incoming signals on the port. <i>Return type:</i> float
source_latency_early_fall_max	Returns the maximum early fall source insertion delay specified by an explicit <code>set_clock_latency</code> at the port. <i>Return type:</i> float
source_latency_early_fall_min	Returns the minimum early fall source insertion delay specified by an explicit <code>set_clock_latency</code> at the port. <i>Return type:</i> float
source_latency_early_rise_max	Returns the maximum early rise source insertion delay specified by an explicit <code>set_clock_latency</code> at the port. <i>Return type:</i> float
source_latency_early_rise_min	Returns the minimum early rise source insertion delay specified by an explicit <code>set_clock_latency</code> at the port. <i>Return type:</i> float
source_latency_late_fall_max	Returns the maximum late fall source insertion delay specified by an explicit <code>set_clock_latency</code> at the port. <i>Return type:</i> float

source_latency_late_fall_min	Returns the minimum late fall source insertion delay specified by an explicit <code>set_clock_latency</code> at the port. <i>Return type:</i> float
source_latency_late_rise_max	Returns the maximum late rise source insertion delay specified by an explicit <code>set_clock_latency</code> at the port. <i>Return type:</i> float
source_latency_late_rise_min	Returns the minimum late rise source insertion delay specified by an explicit <code>set_clock_latency</code> at the port. <i>Return type:</i> float
timing_constant	Returns the constant value on a port. <code>get_property [get_ports D] timing_constant</code> <i>Return type:</i> string
timing_constant_source	Returns the source by which the constant value is applied on a port. <code>get_property [get_ports constant] timing_constant_source</code> <i>Return type:</i> string
total_capacitance_fall	Returns the total capacitance of ports for falling transition. <code>get_property [get_ports out] total_capacitance_fall</code> <i>Return type:</i> float
total_capacitance_rise	Returns the total capacitance of ports for rising transition. <code>get_property [get_ports out] total_capacitance</code> <i>Return type:</i> float
transition_max	Returns the maximum transition limit asserted on the specified port. <code>get_property [get_ports Ip] transition_max</code> <i>Return type:</i> float
user_constant_value	Returns the constant values from constraints for the specified ports. <code>get_property [get_ports D] user_constant_value</code> <i>Return type:</i> integer

wire_capacitance_max	Returns the wire capacitance of the port for the maximum value of the capacitance range. For example, <pre>get_property [get_ports port_pad_data_out[9]] wire_capacitance_max</pre> <i>Return type:</i> float
wire_capacitance_max_fall	Returns the wire capacitance of a port for the maximum value of the falling capacitance range For example, <pre>get_property [get_ports port_pad_data_out[9]] wire_capacitance_max_fall</pre> <i>Return type:</i> float
wire_capacitance_max_rise	Returns the wire capacitance of a port for the maximum value of the rising capacitance range. For example, <pre>get_property [get_ports port_pad_data_out[0]] wire_capacitance_max_rise</pre> <i>Return type:</i> float
wire_capacitance_min	Returns the wire capacitance of a port for the minimum value of the capacitance range. For example, <pre>get_property [get_ports tdigit[2]] wire_capacitance_min</pre> <i>Return type:</i> float
wire_capacitance_min_fall	Returns the wire capacitance of a port for the minimum value of the falling capacitance range. For example, <pre>get_property [get_ports tdigit[2]] wire_capacitance_min_fall</pre> <i>Return type:</i> float

wire_capacitance_min_rise	Returns the wire capacitance of a port for the minimum value of the rising capacitance range. For example, <pre>get_property [get_ports tdigit[2]] wire_capacitance_min_rise</pre> <i>Return type:</i> float
wire_lumped_capacitance_max	Returns the wire lumped capacitance of the net associated to port for maximum conditions. Returns the portion of a port's total lumped capacitance, which may be extracted or annotated wire lumped capacitance values. For example, <pre>get_property [get_ports tdigit[7]] wire_lumped_capacitance_max</pre> <i>Return type:</i> float
wire_lumped_capacitance_max_fall	Returns the lumped wire capacitance of a port for the maximum value of the falling capacitance range. For example, <pre>get_property [get_ports port_pad_data_out[9]] wire_lumped_capacitance_max_fall</pre> <i>Return type:</i> float
wire_lumped_capacitance_max_rise	Returns the lumped wire capacitance of a port for the maximum value of the rising capacitance range. For example, <pre>get_property [get_ports port_pad_data_out[0]] wire_lumped_capacitance_max_rise</pre> <i>Return type:</i> float
wire_lumped_capacitance_min	Returns the portion of a port's total lumped capacitance, which may be extracted or annotated wire lumped capacitance values. For example, <pre>get_property [get_ports tdigit[3]] wire_lumped_capacitance_min</pre> <i>Return type:</i> float

wire_lumped_capacitance_min_fall	Returns the lumped wire capacitance of a port for the minimum value of the falling capacitance range. For example, <pre>get_property [get_ports tdigit[3]] wire_lumped_capacitance_min_fall</pre> <i>Return type:</i> float
wire_lumped_capacitance_min_rise	Returns the lumped wire capacitance of a port for the minimum value of the rising capacitance range. For example, <pre>get_property [get_ports tdigit[3]] wire_lumped_capacitance_min_rise</pre> <i>Return type:</i> float
x_coordinate	Returns the x coordinates of the placed port. <i>Return type:</i> float
y_coordinate	Returns the y coordinates of the placed port. <i>Return type:</i> float

Timing Arc Properties

aocv_derate_capture_clock_early_fall	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of early capture clock paths with fall sink pin transitions. <i>Return type:</i> float
aocv_derate_capture_clock_early_rise	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of early capture clock paths with rise sink pin transitions. <i>Return type:</i> float
aocv_derate_capture_clock_late_fall	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of late capture clock paths with fall sink pin transitions. <i>Return type:</i> float

<code>aocv_derate_capture_clock_late_rise</code>	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of late capture clock paths with rise sink pin transitions. <i>Return type:</i> float
<code>aocv_derate_data_early_fall</code>	Returns AOCV derate values for a timing arc on an early data path with fall transitions. <i>Return type:</i> float
<code>aocv_derate_data_early_rise</code>	Returns AOCV derate values for a timing arc on an early data path with rise transitions. <i>Return type:</i> float
<code>aocv_derate_data_late_fall</code>	Returns AOCV derate values for a timing arc on a late data path with fall transitions. <i>Return type:</i> float
<code>aocv_derate_data_late_rise</code>	Returns AOCV derate values for a timing arc on a late data path with rise transitions. <i>Return type:</i> float
<code>aocv_derate_launch_clock_early_fall</code>	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of early launch clock paths with fall sink pin transitions. <i>Return type:</i> float
<code>aocv_derate_launch_clock_early_rise</code>	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of early launch clock paths with rise sink pin transitions. <i>Return type:</i> float
<code>aocv_derate_launch_clock_late_fall</code>	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of late launch clock paths with fall sink pin transitions. <i>Return type:</i> float
<code>aocv_derate_launch_clock_late_rise</code>	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of late launch clock paths with rise sink pin transitions. <i>Return type:</i> float

<code>aocv_stage_count_capture_clock_early</code>	Returns graph based AOCV stage count values in AOCV mode for a given timing arc that is a part of early capture clock paths. <i>Return type:</i> float
<code>aocv_stage_count_capture_clock_late</code>	Returns graph based AOCV stage count values in AOCV mode for a given timing arc that is a part of late capture clock paths. <i>Return type:</i> float
<code>aocv_stage_count_data_early</code>	Returns AOCV stage count values for a timing arc on an early data path. <i>Return type:</i> float
<code>aocv_stage_count_data_late</code>	Returns AOCV stage count values for a timing arc on a late data path. <i>Return type:</i> float
<code>aocv_stage_count_launch_clock_early</code>	Returns AOCV stage count values in AOCV mode for a given timing arc that is a part of early launch clock paths. <i>Return type:</i> float
<code>aocv_stage_count_launch_clock_late</code>	Returns AOCV stage count values in AOCV mode for a given timing arc that is a part of late launch clock paths. <i>Return type:</i> float
<code>arc_type</code>	Returns the Liberty <code>timing_type</code> attribute of the arc. <i>Return type:</i> string
<code>delay_max</code>	Returns the delay for the maximum corner. For example, <pre>get_property [get_arcs -of_objects [get_cells regbuf]] delay_max</pre> <i>Return type:</i> float
<code>delay_max_fall</code>	Returns the fall delay for the max corner. <i>Return type:</i> float
<code>delay_max_rise</code>	Returns the rise delay for the max corner. <i>Return type:</i> float

delay_mean_max_fall	Returns the mean component of the maximum falling delay value for the timing arc. <i>Return type:</i> float
delay_mean_max_rise	Returns the mean component of the maximum rising delay value for the timing arc. <i>Return type:</i> float
delay_mean_min_fall	Returns the mean component of the minimum falling delay value for the timing arc. <i>Return type:</i> float
delay_mean_min_rise	Returns the mean component of the minimum rising delay value for the timing arc. <i>Return type:</i> float
delay_min	Returns the delay for the minimum corner. For example, <pre>get_property [get_arcs -of_objects [get_cells clkbuf]] delay_min</pre> <i>Return type:</i> float
delay_min_fall	Returns the fall delay for the minimum corner. <i>Return type:</i> float
delay_min_rise	Returns the rise delay for the minimum corner. <i>Return type:</i> float
delay_sigma_max	Returns the 1-sigma variation component of the maximum delay for the specified timing arc. <i>Return type:</i> float
delay_sigma_max_fall	Returns the 1-sigma variation component of the maximum falling delay for the specified timing arc. <i>Return type:</i> float
delay_sigma_max_rise	Returns the 1-sigma variation component of the maximum rising delay for the specified timing arc. <i>Return type:</i> float

delay_sigma_min	Returns the 1-sigma variation component of the minimum delay for the specified timing arc. <i>Return type:</i> float
delay_sigma_min_fall	Returns the 1-sigma variation component of the minimum falling delay for the specified timing arc. <i>Return type:</i> float
delay_sigma_min_rise	Returns the 1-sigma variation component of the minimum rising delay for the specified timing arc. <i>Return type:</i> float
delta_delay_max	Returns the delta delay for the maximum corner. For example, <pre>get_property [get_arcs -of_objects [get_cells clkbuf]] delta_delay_max</pre> <i>Return type:</i> float
delta_delay_max_fall	Returns the delta fall delay for the max corner. <i>Return type:</i> float
delta_delay_max_rise	Returns the delta rise delay for the max corner. <i>Return type:</i> float
delta_delay_min	Returns the delta delay for the minimum corner. For example, <pre>get_property [get_arcs -of_objects [get_cells clkbuf]] delta_delay_min</pre> <i>Return type:</i> float
delta_delay_min_fall	Returns the delta fall delay for the min corner. <i>Return type:</i> float
delta_delay_min_rise	Returns the delta rise delay for the min corner. <i>Return type:</i> float

dynamic_delta_delay_max_fall	Returns the dynamic delay component of the maximum falling delay through the arc. For example, <pre>get_property -view func_worst_cmax_w_dynv [get_arcs -from i_0/A -to i_0/Y] dynamic_delta_delay_max_fall</pre> <i>Return type:</i> float
dynamic_delta_delay_max_rise	Returns the dynamic delay component of the maximum rising delay through the arc. For example, <pre>get_property -view func_worst_cmax_w_dynv [get_arcs -from i_0/A -to i_0/Y] dynamic_delta_delay_max_rise</pre>
dynamic_delta_delay_min_fall	Returns the dynamic delay component of the minimum falling delay through the arc. For example, <pre>get_property -view func_worst_cmax_w_dynv [get_arcs -from i_0/A -to i_0/Y] dynamic_delta_delay_min_fall</pre>
dynamic_delta_delay_min_rise	Returns the dynamic delay component of the minimum rising delay through the arc. For example, <pre>get_property -view func_worst_cmax_w_dynv [get_arcs -from i_0/A -to i_0/Y] dynamic_delta_delay_min_rise</pre>
has_mis_fall	Returns a value of <code>true</code>, if MIS (multi-input switching) derate falling value is specified for timing arcs in the library. <pre>get_property [get_arc -from UC/and1/A1 -to UC/and1/ZN] has_mis_fall</pre> <i>Return type:</i> boolean
has_mis_rise	Returns a value of <code>true</code>, if MIS (multi-input switching) derate rising value is specified for timing arcs in the library. <pre>get_property [get_arcs -from UC/or1/A1 -to UC/or1/ZN] has_mis_rise</pre> <i>Return type:</i> boolean

is_cellarc	Returns a value of <code>true</code> if the arc belongs to a cell. <i>Return type:</i> boolean
is_disabled	Returns a value of <code>true</code> if a <code>set_disable_timing</code> has been applied on the supplied library timing arc. <i>Return type:</i> boolean
mode	Returns the mode specified for the timing arc in the library. <i>Return type:</i> string
object_type	Returns the object type <code>timing_arc</code> . <i>Return type:</i> string
sdf_cond	Returns the <code>sdf_cond</code> expression specified for the timing arc in the library. <i>Return type:</i> string
sdf_cond_end	Returns the <code>sdf_cond_end</code> expression specified for the timing arc in the library. <i>Return type:</i> string
sdf_cond_start	Returns the <code>sdf_cond_start</code> expression specified for the timing arc in the library. <i>Return type:</i> string
sense	Returns the sense of the timing arc. <i>Return type:</i> string
sink_pin	Returns the sink pin of the delay arc, or the reference pin of the check arc. <i>Return type:</i> collection
source_pin	Returns the source pin of the delay arc, or the signal pin of the check arc. <i>Return type:</i> collection

ssi_derate_fall	Returns the SSI (simultaneously switching input) derate falling value specified on library cells. For example, <pre>set_timing_derate 0.5 -fall -data -early - input_switching [get_lib_cells Frlib_v1.0/AND2_X1], get_property [get_arcs -from UC/and1/A1 -to UC/and1/ZN] ssi_derate_fall</pre> <i>Return type:</i> float
ssi_derate_rise	Returns the SSI (simultaneously switching input) derate rising value specified on library cells. For example, <pre>set_timing_derate 0.6 -rise -data -early - input_switching [get_lib_cells Frlib_v1.0/AND2_X1] get_property [get_arcs -from UC/and1/A1 -to UC/and1/ZN] ssi_derate_rise</pre> <i>Return type:</i> float
when	Returns the <code>when</code> condition specified for the timing arc in the library. <i>Return type:</i> string
when_library_string	Returns the exact value of the Liberty 'when' attribute if specified for an arc. <pre>get_property [get_arc -from UC/buff/A -to UC/buff/Z] when_library_string</pre> <i>Return type:</i> string

Timing Path Properties

applied_exception_type	Returns the type of applied exceptions for a timing path. This property can be used to query dominant timing exceptions affecting a timing path. You can use this property to query on constrained/unconstrained timing paths. The possible return values are - multi_cycle, path_delay and false_path - indicating multicycle path, minimum/maximum delay path, and timing false path, respectively. The software will return one of these values for pin-based timing exceptions. However, the software returns "NA" when false paths are defined for clock objects, or if the paths do not have any related timing exception. <i>Return Type:</i> String
arrival	Returns the arrival time at the timing path. <i>Return type:</i> float
arrival_mean	Returns the mean component of the arrival time for the timing path. <i>Return type:</i> float
arrival_sigma	Returns the sigma component of the arrival time for the timing path. <i>Return type:</i> float
arrival_skewness	Returns the skewness in the arrival time for a timing path. <i>Return type:</i> float
arrival_stddev	Returns the standard deviation of the arrival time for a timing path. <i>Return type:</i> float

arrival_wire_stddev	Returns the standard deviation of arrival time due to wire variation for the specified timing paths. <pre>get_property [report_timing -retime path_slew_propagation -split_delay - path_type full_clock -collection] arrival_wire_stddev</pre> <i>Return type:</i> float
capturing_arc	Returns the capturing arc for the specified timing path. <pre>get_property [report_timing -clock_to clk2 - collection] capturing_arc</pre> <i>Return type:</i> collection
capture_clock_path	Returns the capturing clock path of the timing path. This property can be used only for path_type full_clock. <i>Return type:</i> collection
capturing_clock	Returns the capturing clock of the timing path. <i>Return type:</i> collection
capturing_clock_close_edge_time	Returns the closing edge time of the capturing clock. <i>Return type:</i> float
capturing_clock_close_edge_type	Returns the capturing clock edge direction: <code>rise</code> or <code>fall</code>. <i>Return type:</i> string
capturing_clock_is_inverted	Returns a value of <code>true</code> if the phase of the clock at the end point of the capture clock path is opposite to the phase of the capturing clock at the source. <i>Return type:</i> boolean
capturing_clock_is_propagated	Returns a value of <code>true</code> if the capturing clock is in the propagated mode, at the clock end point. <i>Return type:</i> boolean

capturing_clock_latency	Returns the ideal or propagated latency of the capturing clock. <i>Return type:</i> float
capturing_clock_latency_mean	Returns the capturing clock mean latency. <pre>get_property [get_timing_paths] capturing_clock_latency_mean</pre> <i>Return type:</i> float
capturing_clock_latency_sigma	Returns the sigma variation for the capturing clock latency. <pre>get_property [report_timing -collection] capturing_clock_latency_sigma</pre> <i>Return type:</i> float
capturing_clock_latency_skewness	Returns the skewness variation for the capturing clock latency. <pre>get_property [report_timing -collection] capturing_clock_latency_skewness</pre> <i>Return type:</i> float
capturing_clock_latency_stddev	Returns the stddev variation for the capturing clock latency. <pre>get_property [report_timing -collection] capturing_clock_latency_stddev</pre> <i>Return type:</i> float
capturing_clock_open_edge_type	Returns the opening edge time of the capturing clock. <i>Return type:</i> string
capturing_clock_pin	Returns the name of the capturing clock pin. <i>Return type:</i> collection
capturing_point_name	Returns the name of the capturing point. <pre>get_property [report_timing -collection] capturing_point_name</pre> <i>Return type:</i> string

capturing_clock_source_arrival_time	Returns the capturing clock arrival time at the clock root pin/port of the capturing clock path. This value is a sum of the clock edge time and the source latency constraints specified at the clock root. Note: You must specify <code>report_timing -path_type full_clock</code> in order to return capturing clock arrival time information. <i>Return type:</i> float
capturing_clock_source_arrival_time_mean	Returns the mean component of the capturing clock arrival time at the clock root pin/port of the capturing clock path. <i>Return type:</i> float
capturing_clock_source_arrival_time_sigma	Returns the sigma component of the capturing clock arrival time at the clock root pin/port of the capturing clock path. <i>Return type:</i> float
capturing_point	Returns a pointer to the end point of the timing path. <i>Return type:</i> collection
capturing_point_is_level_sensitive	Returns a value of <code>true</code> if the end point of the data path is level sensitive. <i>Return type:</i> boolean
check_delay	Returns the check delay value for the timing path. <i>Return type:</i> float
check_delay_mean	Returns the mean component of the check delay value for the timing path. <i>Return type:</i> float
check_delay_sigma	Returns the sigma component of the check delay value for the timing path. <i>Return type:</i> float

check_delay_sigma_detail	Returns separate delay sigma variation due to correlated variation of current stage, the correlated variation of previous stage, and uncorrelated variation of the current stage on the timing paths, when the <code>delaycal_socv_accuracy_mode</code> attribute is set to medium, high, or ultra. <pre>get_property [report_timing -collection] check_delay_sigma_detail</pre> <i>Return type:</i> string
check_delay_skewness_detail	Returns separate delay skewness variation due to correlated variation of current stage, the correlated variation of previous stage, and uncorrelated variation of the current stage on the timing path when the <code>delaycal_socv_accuracy_mode</code> attribute is set to high or ultra. <pre>get_property [report_timing -collection] check_delay_skewness_detail</pre> <i>Return type:</i> string
check_delay_skewness	Returns the skewness component of the check delay value for a timing path. <i>Return type:</i> float
check_delay_stddev	Returns the check delay standard deviation component of the check delay value for a timing path. <i>Return type:</i> float
check_type	Returns the check type for the timing path. <i>Return type:</i> float
clock_path_end_point	Returns the last point in the capture clock path of the timing path. <i>Return type:</i> collection
clock_source_jitter	Returns the clock source jitter value applied on a specific clock. <i>Return type:</i> float

clock_uncertainty	Returns the clock uncertainty of the timing path. <i>Return type:</i> float
cppr_adjustment	Returns the CPPR adjustment of the timing path. <i>Return type:</i> float
cppr_adjustment_mean	Returns the mean component of CPPR adjustment of the timing path. <i>Return type:</i> float
cppr_adjustment_sigma	Returns the sigma component of CPPR adjustment of the timing path. <i>Return type:</i> float
cppr_adjustment_skewness	Returns the skewness component of CPPR adjustment of a timing path. <i>Return type:</i> float
cppr_adjustment_stddev	Returns the standard deviation component of CPPR adjustment of a timing path. <i>Return type:</i> float
cppr_branch_point	Returns the CPPR branch point of the given timing path. <i>Return Type:</i> collection
cumulative_manhattan_length	Returns the cumulative manhattan length for wires of timing paths. get_property [report_timing -collection] cumulative_manhattan_length <i>Return type:</i> float
cumulative_manhattan_length_x	Returns the cumulative horizontal length for wires of timing paths. get_property [report_timing -collection] cumulative_manhattan_length_x <i>Return type:</i> float

cumulative_manhattan_length_y	Returns the cumulative vertical length for wires of timing paths. <pre>get_property [report_timing -collection] cumulative_manhattan_length_y</pre> <i>Return type:</i> float
cycle_adjustment	Returns the cycle adjustment value for the timing paths. <pre>get_property [report_timing -early - collection] cycle_adjustment</pre> <i>Return type:</i> float
drive_adjustment	Returns the drive adjustment value for the timing path. <i>Return type:</i> float
drive_adjustment_mean	Returns the mean component of the drive adjustment value for the timing path. <i>Return type:</i> float
drive_adjustment_sigma	Returns the sigma component of the drive adjustment value for the timing path. <i>Return type:</i> float
external_delay	Returns the value of the set_output_delay constraint at the end point of the path. <i>Return type:</i> float
gba_slack	Returns the original slack time for the timing path – before PBA retiming is performed. <i>Return type:</i> float
gba_slack_mean	Returns the mean component of the slack time for the timing path – before PBA retiming is performed. <i>Return type:</i> float
gba_slack_sigma	Returns the sigma component of the slack time for the timing path – before PBA retiming is performed. <i>Return type:</i> float

gba_slack_skewness	Returns the skewness variation of slack for GBA analysis. <pre>get_property [report_timing -skip_io_paths -not_through [get_ports *] -collection -early] gba_slack_skewness</pre> <i>Return type:</i> float
gba_slack_stddev	Returns the standard deviation of slack for GBA analysis. <pre>get_property [report_timing -collection] gba_slack_stddev</pre> <i>Return type:</i> float
hold	Returns the hold time at the end point of the path. <i>Return type:</i> float
is_borrow_edge_adjust	Returns a value of <code>true</code> if borrow edge adjustment is set on the timing paths. <pre>get_property [report_timing -through micro_dec/LOCKUP/d -collection] is_borrow_edge_adjust</pre> <i>Return type:</i> boolean
is_clock_gating_hold	Returns a value of <code>true</code> if the path is a clock gating hold check. <i>Return type:</i> boolean
is_clock_gating_setup	Returns a value of <code>true</code> if the path is a clock gating setup check. <i>Return type:</i> boolean
is_coverage_violating_path	Returns a value of <code>true</code> if a timing path contains violations from the timing check coverage. <pre>get_property [report_timing -collection] is_coverage_violating_path</pre> <i>Return type:</i> boolean

is_path_borrowing	Returns a value of <code>true</code> if the specified path is a time borrowing path. <pre>get_property [report_timing -collection -to micro_dec/LOCKUP/d] is_path_borrowing</pre> <i>Return type:</i> boolean
is_retimed	Returns a value of <code>true</code> if the timing path is recalculated using path-based analysis. <pre>get_property [report_timing -retime path_slew_propagation -collection] is_retimed</pre> <i>Return type:</i> boolean
is_time_given	Returns a value of <code>true</code> if for the specified timing path time is applied to the starting point. <pre>get_property [report_timing -to lat/Q -collection] is_time_given</pre> <i>Return type:</i> boolean
is_transparent_latch	Returns a value of <code>true</code> if the path is a transparent latch path. <i>Return type:</i> boolean
launching_clock_latency_mean	Returns mean component of latency of the launching clock. <i>Return type:</i> float
launching_clock_latency_sigma	Returns sigma component of latency of the launching clock. <i>Return type:</i> float
launch_clock_path	Returns the launching clock path of the timing path. This property can be used only for path_type <code>full_clock</code>. <i>Return type:</i> collection
launching_clock	Returns the launching clock of the timing path. <i>Return type:</i> collection

launching_clock_is_inverted	Returns a value of true if the phase of the clock at the start point of the launch clock path is opposite to the phase of the launch clock at the source. <i>Return type:</i> boolean
launching_clock_is_propagated	Returns a value of true if the launching clock is in the propagated mode, at the clock end point. <i>Return type:</i> boolean
launching_clock_latency	Returns the ideal or propagated latency of the launching clock. <i>Return type:</i> float
launching_clock_latency_skewness	Returns the skewness variation for the launching clock latency. <pre>get_property [report_timing -clock_from clk2 -path_type full_clock -collection] launching_clock_latency_skewness</pre> <i>Return type:</i> float
launching_clock_latency_stddev	Returns the standard deviation for the launching clock latency. <pre>get_property [report_timing -clock_from clk2 -path_type full_clock -collection] launching_clock_latency_stddev</pre> <i>Return type:</i> float
launching_clock_root_open_edge_type	Returns the open edge type for the root of the launching clock for the specified timing path. <pre>get_property [report_timing -collection] launching_clock_open_edge_type</pre> <i>Return type:</i> string
launching_clock_source_arrival_time_skewness	Returns the skewness variation of the launching clock arrival time at the source. <pre>get_property [report_timing -clock_from glck -path_type full_clock -collection] launching_clock_source_arrival_time_skewness</pre> <i>Return type:</i> float

launching_clock_source_arrival_time_stddev	Returns the standard deviation of the launching clock arrival time at the source. <pre>get_property [report_timing -clock_from glck -path_type full_clock -collection] launching_clock_source_arrival_time_stddev</pre> <i>Return type:</i> float
launching_clock_open_edge_time	Returns the opening edge time of the launching clock. <i>Return type:</i> float
launching_clock_open_edge_type	Returns the launching clock's open edge type at the launching point of the timing path. In case of input delay path with respect to a clock it will return the clock edge type, which is triggering the path. <i>Return type:</i> string
launching_clock_source_arrival_time	Returns the launching clock arrival time at the clock route pin/port of the launching clock path. This value is the sum of the clock edge time plus any source latency constraint specified at the clock root. Note: You must specify <code>report_timing -path_type full_clock</code> in order to return launching clock arrival time information. <i>Return type:</i> float
launching_clock_source_arrival_time_mean	Returns the mean component of the launching clock arrival time at the clock route pin/port of the launching clock path. <i>Return type:</i> float
launching_clock_source_arrival_time_sigma	Returns the sigma component of the launching clock arrival time at the clock route pin/port of the launching clock path. <i>Return type:</i> float
launching_input_delay	Returns the input delay if the timing path starts from an input or output port. This value is set using <code>set_input_delay</code>. <i>Return type:</i> float

launching_point	Returns a pointer to the start point of the timing path. <i>Return type:</i> collection
launching_point_is_level_sensitive	Returns a value of <code>true</code> if the begin point of the data path is level sensitive. <i>Return type:</i> boolean
launching_point_name	Returns the name of the launching point. <pre>get_property [report_timing -collection] launching_point_name</pre> <i>Return type:</i> string
lending_path_d_pin	Returns the D pin for the specified lending timing path. <pre>get_property [report_timing -to lat/Q - collection -path_type full_clock] lending_path_d_pin</pre> <i>Return type:</i> string
nets	Returns the nets for the specified timing paths. For example, <pre>get_property [get_timing_paths] nets</pre> <i>Return type:</i> string
num_cell_arcs	Returns the number of cell arcs in the given timing path. For example, <pre>set path [report_timing -from <start_point> -to <end_point> -collection] get_property \$path num_cell_arcs</pre> <i>Return Type:</i> float

num_net_arcs	Returns the number of net arcs in the given timing path. For example, <pre>set path [report_timing -from <start_point> -to <end_point> -collection] get_property \$path num_net_arcs</pre> <i>Return Type:</i> float
object_type	Returns the object type <code>timing_path</code>. <i>Return type:</i> string
other_end_arrival	Returns the capture clock path's begin time, In case of SOCV analysis, mean+N*sigma quantile value is reported. <i>Return type:</i> float
other_end_arrival_mean	Returns the mean component of capture clock path's begin time. <i>Return type:</i> float
other_end_arrival_sigma	Returns the sigma component of capture clock path's begin time. <i>Return type:</i> float
other_end_arrival_sigma_detail	Returns separate other end arrival time variation due to correlated and uncorrelated effects on timing paths, when <code>set_delay_cal_mode - socv_accuracy_mode</code> is set to medium, high, or ultra. <pre>get_property [report_timing -collection] other_end_arrival_sigma_detail</pre> <i>Return type:</i> string
other_end_arrival_skewness	Returns the skewness of other end arrival time for the timing path. <pre>get_property [report_timing -collection] other_end_arrival_skewness</pre> <i>Return type:</i> float

other_end_arrival_skewness_detail	Returns separate other end arrival time skewness due to correlated and uncorrelated effects on timing path, when <code>set_delay_cal_mode -socv_accuracy_mode</code> is set to <code>high</code> or <code>ultra</code>. <pre>get_property [report_timing -collection] other_end_arrival_skewness_detail</pre> <i>Return type:</i> string
other_end_arrival_stddev	Returns the standard deviation of other end arrival time for a timing path. <pre>get_property [report_timing -collection] other_end_arrival_stddev</pre> <i>Return type:</i> float
path_adjust_value	Returns the path adjust value asserted on timing paths using the <code>set_path_adjust</code> command. <pre>get_property [report_timing -through UMC/and1 -collection] path_adjust_value</pre> <i>Return type:</i> float
path_cell_delay	Returns the cell delay for the timing path. <pre>get_property [report_timing -collection] path_cell_delay</pre> <i>Return type:</i> float
path_cell_delay_mean	Returns the mean cell delay for the timing path. <pre>get_property [report_timing -collection] path_cell_delay_mean</pre> <i>Return type:</i> float
path_cell_delay_sigma	Returns the sigma component of cell delay for the timing path. <pre>get_property [report_timing -collection] path_cell_delay_sigma</pre> <i>Return type:</i> float

path_delay_adjustment	Returns the delay adjustment asserted on paths using the set_max_delay/set_min_delay command. <pre>get_property [report_timing -through UMC/and1 -collection] path_delay_adjustment</pre> <i>Return type:</i> float
path_delay_wire_stddev	Returns the standard deviation of path delay due to wire variation for the specified timing path. <pre>get_property [report_timing -retime path_slew_propagation -split_delay - path_type full_clock -collection] path_delay_wire_stddev</pre> <i>Return type:</i> float
path_net_delay	Returns the net delay for the timing paths. <pre>get_property [report_timing -collection] path_net_delay</pre> <i>Return type:</i> float
path_net_delay_mean	Returns the mean net delay for the timing paths. <pre>get_property [report_timing -collection] path_net_delay_mean</pre> <i>Return type:</i> float
path_net_delay_sigma	Returns the sigma variation for path net delay for the specified timing path. <pre>get_property [report_timing -retime path_slew_propagation -split_delay - path_type full_clock -collection] path_net_delay_sigma</pre> <i>Return type:</i> float
path_delay	Returns the delay of data path component of a timing path. In case of SOCV analysis, mean+N*sigma quantile delay is reported. <i>Return type:</i> float

path_delay_mean	Returns the mean delay component of data path of a timing path. <i>Return type:</i> float
path_delay_sigma	Returns the sigma delay component of data path of a timing path. <i>Return type:</i> float
path_group	Returns a collection of path groups associated with the timing path. <i>Return type:</i> collection
path_group_name	Returns the name of the path group for the timing path. <i>Return type:</i> string
path_type	Returns a value of <code>max</code> if the path is for setup, or <code>min</code> if the path is for hold. <i>Return type:</i> string
period	Returns the time duration between the launching clock edge and capturing clock edge of the path. The launching clock edge indicates the launching clock time when the signal at the start point of the path is launched, and the capturing clock edge indicates the capturing clock time when the signal at the path end point is captured. For both of these edges, their ideal clock cycle times are considered for calculating the path period. For those paths, where either the launching or capturing clock is absent or asynchronous, the property prints NA. The property works for both setup (late) paths, and hold (early) paths. Usually the path period is decided by a simple subtraction of effective launching edge from the effective capturing edge of the path. Under certain scenario, these edges are moved back or ahead in time, and accordingly the path period is also affected. The following factors impact period:

	a) Multicycle paths: The launch or capture edge will move by the cycle factor depending on the type of multi cycle exception, and this cycle factor is taken into account while computing the period. b) Max delay paths: Any max_delay specification overrides the relationship between capturing and launching edges and sets it to the max_delay value. The period of the path is thus returned as equal to the specified max delay value for sequential max delay paths. Note that a combinational max delay path has at least one of the launch or capture clocks either absent or asynchronous, and hence the effective period is not calculated for them. c) Clock uncertainty: The uncertainties applicable to the interaction of launch and capture clocks for this particular path also affect the effective edges, but this factor is not taken into consideration while computing the period. d) Unconstrained paths: The unconstrained paths have no capture clock and hence period can not be calculated for them. The property will return NA. <i>Return value:</i> float For more information, see "Examples".
phase_shift	Returns the phase shift for the timing paths. <pre>get_property [report_timing -collection] phase_shift</pre> <i>Return type:</i> float
recovery	Returns the recovery time at the end point of the path. <i>Return type:</i> float
removal	Returns the removal time at the end point of the path. <i>Return type:</i> float

required_time	Returns the required time for the timing path. <i>Return type:</i> float
required_time_mean	Returns the mean component of the required time for the timing path. <i>Return type:</i> float
required_time_sigma	Returns the sigma component of the required time for the timing path. <i>Return type:</i> float
required_time_sigma_detail	Returns separate required time variation due to correlated and uncorrelated effects on timing paths, when <code>set_delay_cal_mode - socv_accuracy_mode</code> is set to <code>medium</code> , <code>high</code> , or <code>ultra</code> . get_property [report_timing -collection] required_time_sigma_detail <i>Return type:</i> string
required_time_skewness	Returns the skewness in required time of a timing path. get_property [report_timing -collection] required_time_skewness <i>Return type:</i> float
required_time_skewness_detail	Returns separate required time skewness due to correlated and uncorrelated effects on timing paths, when <code>set_delay_cal_mode - socv_accuracy_mode</code> is set to <code>high</code> or <code>ultra</code> . get_property [report_timing -collection] required_time_skewness_detail <i>Return type:</i> string
required_time_stddev	Returns the standard deviation of the required time for a timing path. get_property [report_timing -collection] required_time_stddev <i>Return type:</i> float

setup	Returns the setup time at the end point of the path. <i>Return type:</i> float
skew	Returns the latency difference between the launching clock latency and capturing clock latency of the path (after considering the effect of CPPR factor). <i>Return type:</i> float
slack	Returns the slack time for the timing path. <i>Return type:</i> float
slack_mean	Returns the mean component of the slack time for the timing path. <i>Return type:</i> float
slack_sigma	Returns the sigma component of the slack time for the timing path. <i>Return type:</i> float
slack_sigma_detail	Returns separate slack sigma variation due to correlated and uncorrelated effects on timing paths, when <code>set_delay_cal_mode - socv_accuracy_mode</code> is set to medium, high, or ultra. <code>get_property [report_timing -collection] slack_sigma_detail</code> <i>Return type:</i> string
slack_skewness	Returns slack skewness for the timing paths. <code>get_property [report_timing -collection] slack_skewness</code> <i>Return type:</i> float

slack_skewness_detail	Returns separate slack skewness variation due to correlated and uncorrelated effects on timing paths, when <code>set_delay_cal_mode -socv_accuracy_mode</code> is set to <code>high</code> or <code>ultra</code>. <pre>get_property [report_timing -collection] slack_skewness_detail</pre> <i>Return type:</i> string
slack_wire_stddev	Returns the standard deviation of slack due to wire variation for the specified timing paths. <pre>get_property [report_timing -retime path_slew_propagation -split_delay - path_type full_clock -collection] slack_wire_stddev</pre> <i>Return type:</i> float
slack_stddev	Returns standard deviation of the slack. <i>Return type:</i> float
spatial_distance	Reports the bounding box distance for spatial derating applied on a timing path. <i>Return type:</i> float
spatial_distance_cell	Reports the bounding box distance for cells. <i>Return type:</i> float
spatial_distance_net	Reports the bounding box distance for nets. <i>Return type:</i> float
time_borrowed	Returns the amount of time borrowed from the timing end point. <i>Return type:</i> float
time_lent	Returns the amount of time lent to the timing start point. <i>Return type:</i> float
timing_points	Returns a collection of the timing points that make up the path. <i>Return type:</i> collection

total_cell_delta_delay	Returns the total cell incremental delay present in the timing paths. <pre>get_property [report_timing -through clk_I1/ZN -unconstrained -collection] total_cell_delta_delay</pre> <i>Return type:</i> float
total_delta_delay	Returns the total incremental delay present in the timing paths. <pre>get_property [report_timing -through clk_L1_I1/ZN -unconstrained -collection] total_delta_delay</pre> <i>Return type:</i> float
total_net_delta_delay	Returns the total net incremental delay present in the timing paths. <pre>get_property [report_timing -through clk_L1_I1/ZN -unconstrained -collection] total_net_delta_delay</pre> <i>Return type:</i> float
underated_slack	Returns the underated slack time for the timing path. The underated slack value is available with timing path object only if it is generated using the <code>-derate</code> parameter. <i>Return type:</i> float
view_name	Returns the analysis view name associated with the timing path. <i>Return type:</i> string
wire_variation_capacitance_slack_delta	Returns a list of lists with slack shift due to capacitance of each layer. <i>Return type:</i> string
wire_variation_layer_info	Returns layer information for wire variation analysis. <i>Return type:</i> string

wire_variation_layer_slack_delta	Returns a list of lists with total slack shift per layer. <i>Return type:</i> string
wire_variation_resistance_slack_delta	Returns a list of lists with slack shift due to resistance of each layer. <i>Return type:</i> string
wire_variation_slack_shift	Returns a list of lists with slack shift. <i>Return type:</i> string
wire_variation_slack_shift_total	Returns a list of lists with total slack shift. <i>Return type:</i> string
worst_cell_delay	Returns the worst cell delay of the timing paths. <pre>get_property [report_timing -collection] worst_cell_delay</pre> <i>Return type:</i> float
worst_cell_delay_mean	Returns the worst mean cell delay of the timing paths. <pre>get_property [report_timing -collection] worst_cell_delay_mean</pre> <i>Return type:</i> float
worst_cell_delay_sigma	Returns the sigma component for worst cell delay in the timing paths. <pre>get_property [report_timing -collection] worst_cell_delay_sigma</pre> <i>Return type:</i> float
worst_cell_delay_skewness	Returns the skewness for worst cell delay in the timing paths. <pre>get_property [report_timing -collection] worst_cell_delay_skewness</pre> <i>Return type:</i> float

worst_cell_delay_stddev	Returns the standard deviation for worst cell delay in the timing paths. <pre>get_property [report_timing -collection] worst_cell_delay_stddev</pre> <i>Return type:</i> float
worst_cell_delta_delay	Returns the worst cell delta delay of the timing paths. <pre>get_property [report_timing -through clk_L16/ZN -unconstrained -collection] worst_cell_delta_delay</pre> <i>Return type:</i> float
worst_delay	Returns the worst delay for the timing paths. <pre>get_property [report_timing -collection] worst_delay</pre> <i>Return type:</i> float
worst_delay_mean	Returns the mean worst delay for the timing paths. <pre>get_property [report_timing -collection] worst_delay_mean</pre> <i>Return type:</i> float
worst_delay_sigma	Returns the sigma component for worst delay in the timing paths. <pre>get_property [report_timing -collection] worst_delay_sigma</pre> <i>Return type:</i> float
worst_delay_skewness	Returns the skewness for worst cell delay in the timing paths. <pre>get_property [report_timing -collection] worst_delay_skewness</pre> <i>Return type:</i> float

worst_delay_stddev	Returns the standard deviation for worst cell delay in the timing paths. <pre>get_property [report_timing -collection] worst_delay_stddev</pre> <i>Return type:</i> float
worst_delta_delay	Returns the worst delta delay for the timing paths. <pre>get_property [report_timing -through clk_L16/ZN -unconstrained -collection] worst_delta_delay</pre> <i>Return type:</i> float
worst_manhattan_length	Returns the worst manhattan length of the timing paths. <pre>get_property [report_timing -collection] worst_manhattan_length</pre> <i>Return type:</i> float
worst_manhattan_length_net_name	Returns the name of the net with worst manhattan length in the timing paths. <pre>get_property [report_timing -collection] worst_manhattan_length_net_name</pre> <i>Return type:</i> string
worst_net_delay	Returns the worst net delay for the timing paths. <pre>get_property [report_timing -collection] worst_net_delay</pre> <i>Return type:</i> float
worst_net_delay_mean	Returns the mean worst net delay for the timing paths. <pre>get_property [report_timing -collection] worst_net_delay _mean</pre> <i>Return type:</i> float

worst_net_delay_sigma	Returns the sigma variation for worst net delay for the specified timing paths. <pre>get_property [report_timing -retime path_slew_propagation -split_delay - path_type full_clock -collection] worst_net_delay_sigma</pre> <i>Return type:</i> float
worst_net_delay_skewness	Returns the skewness for the worst net delay for the specified timing paths. <pre>get_property [report_timing -retime path_slew_propagation -split_delay - path_type full_clock -collection] worst_net_delay_skewness</pre> <i>Return type:</i> float
worst_net_delay_stddev	Returns the standard deviation for the worst net delay for the specified timing paths. <pre>get_property [report_timing -retime path_slew_propagation -split_delay - path_type full_clock -collection] worst_net_delay_stddev</pre> <i>Return type:</i> float
worst_net_delta_delay	Returns the worst net incremental delay for the timing paths. <pre>get_property [report_timing -through clk_L16/ZN -unconstrained -collection] worst_net_delta_delay</pre> <i>Return type:</i> float

Timing Point Properties

adjustment_in_delay	Returns the adjustment in delay for the specified timing point of a timing path. <pre>get_property [get_property [get_property [report_timing -from dff0/Q -to dff2/D -path_type full_clock -collection] capture_clock_path] timing_points] adjustment_in_delay</pre> <i>Return type:</i> float
arrival	Returns the arrival time at the timing point. <i>Return type:</i> float
arrival_mean	Returns the mean component of the arrival time at the timing point. <i>Return type:</i> float
arrival_sigma	Returns the sigma component of arrival time at the timing point. <i>Return type:</i> float
arrival_skewness	Returns the skewness in arrival for a timing point. <pre>get_property [get_property [report_timing -collection] timing_points] arrival_skewness</pre> <i>Return type:</i> float
arrival_stddev	Returns the standard deviation of arrival time for a timing point. <pre>get_property [get_property [report_timing -collection] timing_points] arrival_stddev</pre> <i>Return type:</i> float
arrival_wire_stddev	Returns the standard deviation of arrival time due to wire variation for the specified timing point. <pre>get_property [get_property [report_timing -retime path_slew_propagation -split_delay -path_type full_clock - collection] timing_points] arrival_wire_stddev</pre> <i>Return type:</i> float
delay	Returns the delay value for the timing point. <i>Return type:</i> float
delay_mean	Returns the mean component of the delay value for the timing point. <i>Return type:</i> float

delay_sigma	Returns the sigma component of the delay value for the timing point. <i>Return type:</i> float
delay_skewness	Returns the standard deviation of slew due to wire variation for the specified timing points. <pre>get_property [get_property [report_timing -collection] timing_points] delay_skewness</pre> <i>Return type:</i> float
delay_stddev	Returns the standard deviation of delay for the timing points. <pre>get_property [get_property [report_timing -collection] timing_points] delay_stddev</pre> <i>Return type:</i> float
delay_wire_stddev	Returns the standard deviation of delay due to wire variation for the specified timing points. <pre>get_property [get_property [report_timing -retime path_slew_propagation -split_delay -path_type full_clock - collection] timing_points] delay_wire_stddev</pre> <i>Return type:</i> float
direction	Returns the direction of the timing points. <pre>get_property [get_property [report_timing -collection] timing_points] direction</pre> <i>Return type:</i> string
delta_delay	Returns the incremental delay on a timing point after SI analysis is performed. <i>Return type:</i> float
fanin_arc	Returns the delay arc for the corresponding timing point. <i>Return type:</i> collection
hierarchical_name	Returns the hierarchical name of the timing points. <pre>get_property [get_property [report_timing -collection] timing_points] hierarchical_name</pre> <i>Return type:</i> string

is_fanin_arc_cellarc	Returns a value of <code>true</code> if the fan in arc of the timing points is a cell arc. <pre>get_property [get_property [report_timing -through UMC/and1 -collection] timing_points] is_fanin_arc_cellarc</pre> <i>Return type:</i> boolean
is_hierarchical	Returns a value of <code>true</code> if the timing point is hierarchical. <pre>get_property [get_property [report_timing -through UMC/latch/D -unconstrained -collection] timing_points] is_hierarchical</pre> <i>Return type:</i> boolean
net	Returns the net for the timing points. <pre>get_property [get_property [report_timing -collection] timing_points] net</pre> <i>Return type:</i> collection
object_type	Returns the <code>timing_point</code> object type. <i>Return type:</i> string
pin	Returns a collection of pins or ports of the timing point. <i>Return type:</i> collection
retime_mis_delta	Returns the retime MIS (multi-input switching) delta delay of PBA paths. <i>Return type:</i> float
si_object	Returns the <code>si_victim</code> object type that can be used to query SI delay attributes. Note: To enable SI objects, you can set the <code>timing_report_enable_si_debug</code> global variable to <code>true</code>.
slew	Returns the path-specific slew of the timing point. <i>Return type:</i> float
slew_mean	Returns the mean component of the path-specific slew of the timing point. <i>Return type:</i> float
slew_sigma	Returns the sigma component of the path-specific slew of the timing point. <i>Return type:</i> float

slew_skewness	Returns the skewness of slew for the specified timing points. <pre>get_property [get_property [report_timing -collection] timing_points] slew_skewness</pre> <i>Return type:</i> float
slew_stddev	Returns the standard deviation of slew for the specified timing points. <pre>get_property [get_property [report_timing -collection] timing_points] slew_stddev</pre> <i>Return type:</i> float
slew_wire_stddev	Returns the standard deviation of slew due to wire variation for the specified timing points. <pre>get_property [get_property [report_timing -retime path_slew_propagation -split_delay -path_type full_clock -collection] timing_points] slew_wire_stddev</pre> <i>Return type:</i> float
spatial_derate	Returns the spatial derate on the timing points. <pre>get_property [get_property [report_timing -collection] timing_points] spatial_derate</pre> <i>Return type:</i> float
spatial_derate_sigma	Returns the sigma component of spatial derate on the timing points. <pre>get_property [get_property [report_timing -collection] timing_points] spatial_derate_sigma</pre> <i>Return type:</i> float
ssi_derate	Returns the path-specific SSI derate of the timing points. <pre>get_property [index_collection [get_property [report_timing - collection] timing_points] 4] ssi_derate</pre> <i>Return type:</i> float
total_derate	Returns the total derate on the timing points. <pre>get_property [get_property [report_timing -collection] timing_points] total_derate</pre> <i>Return type:</i> float

total_derate_sigma	Returns the sigma component of total derate on the timing points. <pre>get_property [get_property [report_timing -collection] timing_points] total_derate_sigma</pre> <i>Return type:</i> float
transition_type	Returns the transition type of the timing point - rise or fall. <i>Return type:</i> string
user_derate	Returns the derate set using the <code>set_timing_derate</code> command on the timing points. <pre>get_property [get_property [report_timing -collection] timing_points] user_derate</pre> <i>Return type:</i> float
user_derate_sigma	Returns the sigma variation derate set using the <code>set_timing_derate</code> command on the timing points. <pre>get_property [get_property [report_timing -collection] timing_points] user_derate_sigma</pre> <i>Return type:</i> float
voltage	Returns the voltage at a timing points. <pre>get_property [get_property [report_timing -collection] timing_points] voltage</pre> <i>Return type:</i> float
vtskew_mean_derate	Reports the mean derating factors of voltage threshold (VT) skew for a timing point. <i>Return type:</i> float
vtskew_sigma_derate	Reports the sigma derating factors of voltage threshold (VT) skew for a timing point. <i>Return type:</i> float

Signal Integrity Attributes

The signal integrity attributes can be queried using the following object types:

- `si_victim`

- `si_attacker`
- `noise_victim`: Returns a collection of `si_victim` objects that can be used to query glitch attributes.
Return type: collection

These are explained below.

si_victim Properties

The following information is saved under the `si_victim` object type:

Property Name	Description	Valid for Properties		
		si_victim	si_object	noise_victim
<code>annotated_glitch</code>	Reports the annotated glitch. <i>Return type</i> : float	N	N	Y
<code>attackers</code>	Returns a collection of <code>si_attacker</code> objects that can be used to query attacker attributes. <i>Return type</i> : collection	Y	Y	Y
<code>capacitance</code>	Returns the total capacitance of victim net. <i>Return type</i> : float	Y	Y	Y
<code>coupling_capacitance</code>	Returns the total coupling capacitance of a victim net. <i>Return type</i> : float	Y	Y	Y
<code>glitch_area</code>	Returns the glitch area. <i>Return type</i> : float	N	N	Y
<code>glitch_width</code>	Returns the glitch width. <i>Return type</i> : float	N	N	Y
<code>hierarchical_name</code>	Returns the hierarchical name of a victim net. <i>Return type</i> : string	Y	Y	Y

input_peak	Returns the Receiver Input Peak (RIP) value. <i>Return type: float</i>	N	N	Y
input_peak_slack	Returns the Receiver Input Peak (RIP) slack value. <i>Return type: float</i>	Y	N	N
input_failure_threshold	Returns the failure threshold at RIP. This will always be reported irrespective of whether failure happens at RIP or ROP. <i>Return type: float</i>	N	N	Y
level	Returns the noise level - VL or VH. <i>Return type: string</i>	N	N	Y
num_active_attackers	Returns the number of active attackers. <i>Return type: float</i>	Y	Y	Y
num_attackers	Returns the number of total attackers (distinct + accumulated small attacker - as 1). The attackers that are dropped from the accumulated small attackers will not be included with the total attackers. <i>Return type: float</i>	Y	Y	Y
object_type	Returns the object type <code>si_victim</code> . <i>Return type: string</i>	Y	Y	Y
prop_glitch	Reports the propagated glitch seen at the victim driver output. <i>Return type: float</i>	N	N	Y
receiver_peak	Returns the Receiver Output Peak (ROP) value. <i>Return type: float</i>	N	N	Y

receiver_peak_slack	Returns the Receiver Output Peak (ROP) slack value. <i>Return type:</i> string	Y	N	N
receiver_peak_threshold	Returns the failure threshold at ROP. This will always be reported irrespective of whether failure happens at RIP or ROP. <i>Return type:</i> float	N	N	Y
resistance	Returns the total resistance of a victim net. <i>Return type:</i> string	Y	Y	Y
transition	Returns the victim transition direction (rise or fall). <i>Return type:</i> string	Y	Y	N
view_type	Returns the type of analysis (early or late). <i>Return type:</i> string	Y	Y	N

si_attacker Properties

The following Information is saved under the `si_attacker` object type for each attacker of the victim net in the path:

Property Name (for each attacker retrieved from a victim)	Description
coupling_capacitance	Returns the coupling of a victim net. <i>Return type:</i> float
hierarchical_name	Returns the hierarchical name of an attacker. <i>Return type:</i> string
is_active	Returns whether an attacker is active or not. <i>Return type:</i> string

noise_peak	Returns the Xtalk delay bump induced by an attacker. <i>Return type:</i> float
object_type	Returns the <code>si_attacker</code> object type. <i>Return type:</i> string
slew	Returns the slew of attackers. <i>Return type:</i> float
state	Returns the status of attackers. The status descriptions are given below: • SY: Synchronous • INF: Attacker with infinite timing window • PE: Filtered due to physical exclusion • UF: Filtered by user • CN: Filtered because it is a constant net • SB: Filtered due to small bump • TA: Filtered because of timing window does not overlap • LC: Filtered due to logical correlation • NA: Attacker status is not known <i>Return type:</i> string

Examples

The following `get_property` example shows the usage of SI attributes to query noise information:

```
source pinlist.tcl
set chan [open attribute.log w]
foreach pin $pinList {
    set vicArray [get_property [get_pins $pin] noise_victim]
    foreach_in_collection vic $vicArray {
        set input_peak [ get_property $vic input_peak]
        #if { $input_peak > 250 } {}

        set vic_name [ get_property $vic hierarchical_name ]
    }
}
```

```

set x [ get_property [get_net -of_objects $vic_name ] name ]
set level [ get_property $vic level]
set ccap [ get_property $vic capacitance]
set vdd [get_property [get_pins $vic_name] power_rail_voltage_max]
set libs [get_libs -of_objects [get_lib_cells -of_objects [get_cells -of_objects
[get_pins $vic_name]]]]
foreach_in_collection libName $libs {set library [get_property $libName
hierarchical_name]}
set prop_glitch [ get_property $vic prop_glitch]
set cap [format %.2f $ccap]
set annotated_glitch [ get_property $vic annotated_glitch]
set receiver_peak [ get_property $vic receiver_peak]
set input_peak_threshold [ get_property $vic input_failure_threshold ]
set receiver_peak_threshold [ get_property $vic receiver_peak_threshold]
puts $chan "-----"
-----"

puts $chan "Peak(mV) Level TotalCap(fF) Vdd(V) Library VictimNet"
puts $chan "$input_peak $level $cap $vdd $library $vic_name {$x}"

if { $receiver_peak > 0 } {
    puts $chan "Receiver output peak:"
    puts $chan "Value ReceiverNet"
    puts $chan "$receiver_peak ( $receiver_peak_threshold) $vic_name (CELL)"
}

if { $input_peak > 0 } {
    puts $chan "Receiver Input peak:"
    puts $chan "Value ReceiverNet"
    puts $chan "$input_peak ( $input_peak_threshold) $vic_name (CELL)"
}

puts $chan "\nConstituents:"
puts $chan "Source Peak(mV) Offset(ps) Slew(ps) Xcap(fF) Vdd(V) Edge Status Net"
set aggs [ get_property $vic attackers ]
foreach_in_collection current_agg $aggs {

    set hierarchical_name [ get_property $current_agg hierarchical_name ]
    set noise_peak [ get_property $current_agg noise_peak]
    set state [ get_property $current_agg state]
    set slew [ get_property $current_agg slew]
    set edge [ get_property $current_agg transition]
    if {[string match ~* $hierarchical_name]} {
        set vdd [get_property [get_pins $vic_name] power_rail_voltage_max]
    } else {
        set vdd [get_property [get_pins -of_objects [get_nets $hierarchical_name]]
power_rail_voltage_max]
    }
    set coupling_capacitance [ get_property $current_agg coupling_capacitance]

```

```

        puts $chan "Cpl: $noise_peak $slew $edge $vdd $coupling_capacitance $state
$hierarchical_name"
    }
    if { $prop_glitch > 0 } {
        puts $chan "Prp: $prop_glitch"
    }

}
close $chan

```

For more information on querying SI attributes, refer to "Signal Integrity Delay and Glitch Analysis" chapter in the *Tempus User Guide*.

User-Defined Properties

The user-defined properties allow you to define certain properties which can be interpreted by the software in a predefined way. When these properties are not specified, the software will revert to the default behavior, as applicable.

Property Name	Type	Description
capacitive_load_unit	lib	Provides the load unit mentioned in the library.
time_unit	lib	Provides the time unit mentioned in the library.
aocv_weight	lib_cell	Defines AOCV weight for a given cell.
k_input_switching_window_fall*	lib	Defines the switching window threshold for fall signal during the application of SSI (simultaneous switching input) derating feature. <i>Default: 1</i>
k_input_switching_window_rise*	lib	Defines the switching window threshold for rise signal during the application of SSI (simultaneous switching input) derating feature. <i>Default: 1</i>

* When the above properties are defined in SSI derating environment, the delay of the respective cell multiplied by the above factor will be compared with the difference in (rise/fall) signal arrivals at two inputs to determine if switching derate needs to be applied to cell delay.

Examples

- The following command returns the hierarchical name for the pin contained in the collection referenced by \$pin:

```
get_property $pin hierarchical_name
```

- The following example shows how you can query a user-defined property from stage_weighting library at the cell level:

```
set_property [get_lib_arcs -of fast/BUFX2] stage_weighting 3 // sets the value
get_property [get_lib_arcs -of fast/BUFX2] stage_weighting
```

- The following example shows power and ground pins for the corresponding library pins:

```
get_property [get_lib_pins CELLA/A] related_power_pin
get_property [get_lib_pins CELLA/A] related_ground_pin
```

- The following example shows active clocks:

```
get_property [get_clocks lclk1] is_active true
```

- The following commands define the switching window threshold for rise signal:

```
define_property -type float -object_type lib k_input_switching_window_rise
set_property [get_libs slow] k_input_switching_window_rise 1.1
```

- The following example shows that the phase shift returned by the period property:

```
report_timing -from [get_clocks refclk] -to [get_clocks m_spi_clk]
Path 1: VIOLATED (-1.869 ns) Setup Check with Pin SP_IN/sp_reg[0]/CK->D

- `set_property`
- `reset_property`
- `define_property`
- `report_object_property_names`

index_collection

```
index_collection
[-help]
base_collection index
```

Returns a collection containing the object that exists at the specified index of the specified object collection.

Parameters

<code>-help</code>	Prints out the command usage.
<code>base_collection</code>	Specifies the base collection.
<code>index</code>	Specifies the index number. You can specify a number from 0 to <code>collection_size-1</code> .

Examples

- The following command returns the object that exists at the index number 2 in the object collection referenced by `$nets`:
`tempus> index_collection $nets 2`

Related Commands

- `range_collection`

query_objects

```
[-help]  
query_objects collection [-limit value]
```

Displays the names of the objects contained inside the specified collection.

 The `query_objects` command displays object names only. To return a tcl list of object names, the `get_object_name` command may be used instead.

Parameters

<code>-help</code>	Prints out the command usage.
<code>collection</code>	Specifies the object collection for which to print names.
<code>-limit value</code>	Specifies the maximum number of object names to print. Specify a value of 0 to query the names of all of the objects in the collection. <i>Default:</i> Prints the first 100 object names in the collection.

Examples

- The following commands create collections of pins and nets, add them together to create a new collection, and prints the names of the objects in the collection:

```
set pins [get_pins {i_block1/b1_Sin1 i_block1/b1_CLK1 i_block1/b1_Sout1}]  
set nets [get_nets {Sin1 CLK1 Sout1}]  
add_to_collection newVar $pins  
add_to_collection newVar $cells  
query_objects $newVar
```

The software returns the following information:

```
i_block1/b1_Sin1 i_block1/b1_CLK1 i_block1/b1_Sout1 Sin1 CLK1 Sout1
```

Related Commands

- [get_object_name](#)

range_collection

```
range_collection  
[-help]  
base_collection  
from  
to
```

Returns a sub-collection of the base collection. The sub-collection range lies between the ‘from’ and ‘to’ (including ‘from’ and ‘to’) index numbers specification of this command.

Parameters

<code>-help</code>	Prints out the command usage.
<code>base_collection</code>	Specifies the base collection.
<code>from</code>	Specifies the ‘from’ index number.
<code>to</code>	Specifies the ‘to’ index number.

The index number can be an integer or an expression, such as, “end OR end-integer” (with no spaces within the expression).

If the specified to/from value is negative (less than 0), then the software will change this value to 0. If the value is greater than the “collection_size – 1”, then it will be changed to “collection_size – 1”.

Examples

- The following example sets `$points` as the base collection:

```
tempus > set points [get_cells *]  
0x13  
tempus > sizeof_collection $points  
22
```

- The following example returns the sub-collection of the base collection `$points` between the index number range from 2 to 4:

```
tempus > range_collection $points 2 4  
clk_buf2 clk_buf3 clk_buf4  
0x16  
tempus > range_collection $points 4 2  
clk_buf2 clk_buf3 clk_buf4  
0x17
```

- The following example returns a sub-collection starting from index number 0 till the end of the base collection:

```
tempus > range_collection $points 0 end
clk_buf1 pad1 clk_buf2 clk_buf3 clk_buf4 buf1 buf2 buf3 buf4 mem dff1 dff2 clkand2
pu_cell_1 pu_lat_1 u1 cg4 genLoop comboLoop pad2 dff3 latch1
0x18
```

- The following example returns a sub-collection starting from end-integers 4 to 2:

```
tempus > range_collection $points end-4 end-2
genLoop comboLoop pad2
0x19
```

- The following example shows a range starting from a negative value to a value greater than the collection size. The following warning messages are displayed:

```
tempus > range_collection $points -5 100
**WARN: (TCLCMD-1419): 'from' index with value -5 is less than start index, so it is
changed to 0 .
**WARN: (TCLCMD-1419): 'to' index with value 100 is greater than end index, so it is
changed to 21 .
clk_buf1 pad1 clk_buf2 clk_buf3 clk_buf4 buf1 buf2 buf3 buf4 mem dff1 dff2 clkand2
pu_cell_1 pu_lat_1 u1 cg4 genLoop comboLoop pad2 dff3 latch1
0x1a
```

- The following example shows the warning message displayed for a negative start index number:

```
tempus > range_collection $points end-25 end-20
**WARN: (TCLCMD-1419): 'from' index with value -4 is less than start index, so it is
changed to 0 .
clk_buf1 pad1
0x1b
```

- The following command shows an error if the specified index number is not an integer:

```
tempus > range_collection $points s end
**ERROR: (TCLCMD-1418): Bad index 's': must be integer? or end?[-]integer?
```

Related Commands

- [index_collection](#)

remove_from_collection

```
remove_from_collection
[-help]
base_collection
[-intersect]
collection_or_obj_list
```

Creates a new collection by removing the objects specified in one collection from another collection.

Parameters

-help	Prints out the command usage.
base_collection	Specifies the base collection of objects. Objects from the second collection or object list are removed from this collection to create the new collection.
-intersect	Provides intersection of base collection elements with second collection of objects or lists.
collection_or_obj_list	Specifies the collection or list of objects that should be removed from the base collection to create a new collection. When specified, this parameter returns those elements that intersect and exist in both the <i>base_collection</i> and the second collection. Also, all the elements of <i>base_collection</i> that do not intersect with second collection will be removed.

Examples

- The following commands create a collection of pins that does not include clock pins:

```
set allP [get_pins *]
set all_pin_no_clock [remove_from_collection $allP [get_pins -filter "is_clock ==
true"]]
```

You can use the `sizeof_collection` command to see that the `all_pin_no_clock` collection contains fewer objects (that is, no clock pins) than the original `allP` collection:

```
sizeof_collection $allP
50

sizeof_collection $all_pin_no_clock
47
```

Related Commands

- [range_collection](#)
- [index_collection](#)

report_object_property_names

```
report_object_property_names [-help]
[-obj_type {cell clock design lib lib_cell lib_pin lib_timing_arc net path_group pin port
timing_arc timing_path timing_point}]
```

Lists all of the properties associated with the specified object type.

If you do not specify any object type, this command lists all the supported object types, and all the properties associated with those object types.

Parameters

-help	Prints out the command usage.
- obj_type	Lists the properties associated with the specified object type. The following object types are supported: cell, clock, design, lib, lib_cell, lib_pg_pin, lib_pin, lib_timing_arc, net, path_group, pg_net, pg_pin, pin, port, si_attacker, si_victim, timing_arc, timing_path, or timing_point Additional SI properties can be included with the <code>timing_point</code> object. To enable SI properties, you can set <code>timing_report_enable_si_debug</code> attribute to <code>true</code>.

Related Commands

- `define_property`
- `get_property`
- `report_property`
- `reset_property`
- `set_property`

report_property

```
report_property
[-help]
{collection | list_of_collections}
[-property_list list_of_properties]
[{> | >>} filename]
```

Reports the properties associated with each object in the specified collection.

For properties that return a populated collection, the command output displays { ... }. For any empty collections, {} will be displayed.

Parameters

-help	Prints out the command usage.
<i>collection list_of_collections</i>	Specifies a collection, or a list of collections to report. The collections can contain any of the following object types: cell, clock, design, lib, lib_cell, lib_pin, lib_pg_pin, pg_net, pg_pin, lib_timing_arc, net, path_group, pin, port, timing_arc, timing_path, or timing_point
<i>-property_list list_of_properties</i>	Specifies a list of valid property names to report. Note: If the <i>-property_list</i> parameter is not specified, then all the properties associated with a collection of objects will be reported.
<i>{> >>} filename</i>	When specified with >, the software writes the report to the specified file name. If the file already exists, the software overwrites it. When specified with >>, the software writes the report to the specified file name. If the file already exists, the software concatenates the report to the end of the file. You can add the .gz extension to the file name to generate a compressed report. Note: The file name must be the last argument in the list.

Examples

- The following command shows the values of the specified properties:

```
report_property [get_pins E_C517_dgt_2_/Z] -property_list {name direction clocks}
```

property	value

name	Z
direction	out
clocks	{}

- The following command shows the values of the specified cell instances:

```
report_property [get_cells DT_MUX_INST/E_C17_23]
```

property	value

area	0.532
clock_gating_integrated_cell	
early_cell_check_derate_factor	1.000
early_cell_check_mean_derate_factor	1.000
early_cell_check_sigma_derate_factor	1.000
early_clk_cell_derate_factor	0.900
early_clk_cell_mean_derate_factor	0.900

Related Commands

sizeof_collection

```
sizeof_collection  
[-help]  
collection
```

Returns the total number of objects contained in the specified collection. If the collection contains different types of objects, `sizeof_collection` returns the sum of all the objects of different types in the collection.

Parameters

<code>-help</code>	Prints out the command usage.
<code>collection</code>	Specifies the collection.

sort_collection

```
sort_collection  
[-help]  
collection  
[-dictionary]  
{property_or_list_of_properties}  
[-descending]
```

Returns a sorted collection of objects based on the property.

Parameters

-help	Prints out the command usage.
collection	Specifies the collection to sort. The collection must be a homogenous collection of any one of the following object types: cell, clock, design, lib, lib_cell, lib_pin, lib_timing_arc, net, path_group, pin, port, timing_arc, timing_path, OR timing_point.
-descending	Sorts the objects in the collection by descending order. <i>Default:</i> Sorts the collection in ascending order.
-dictionary	Sorts the objects in a collection by dictionary order.
property list_of_properties	Sorts the collection by the specified property. You can specify any property associated with the object type. You can specify one or more properties. If you specify more than one property, the software sorts the collection in the order by which you specified the properties.

Examples

- The following command returns a collection of all the input ports in the design sorted on the basis of their hierarchical names:

```
tempus > sort_collection [all_inputs] hierarchical_name
```

```
CLK1 CLK2 CLK3 CLK4 IN1 IN2 IN3 IN4
```

parse_proc_arguments

```
parse_proc_arguments
-help
-args string
result_array
[forced_proc]
```

Supports argument validation within a Tcl procedure and enables the use of the `-help` option to view the help information associated with the procedure.

Procedures using the `parse_proc_arguments` command will validate the arguments. If the required arguments are missing or have invalid values, the `parse_proc_arguments` command generates a Tcl error and the calling procedure terminates.

The `parse_proc_arguments` command must be the first command called in the procedure. This command cannot be used outside of a procedure.

Parameters

<code>-help</code>	Prints out the command usage.
<code>-args <i>string</i></code>	Specifies the list of arguments passed to the Tcl procedure.
<code><i>result_array</i></code>	Specifies the result array into which the parsed arguments are to be stored.
<code><i>forced_proc</i></code>	Specifies the name of the invoking procedure.

Examples

The following Tcl procedure uses the `parse_proc_arguments` command for argument validation.

```
proc cmdProc {args} {
    parse_proc_arguments -args $args results
    foreach argname [array names results] {
        puts "$argname = $results($argname)"
    }
}

define_proc_arguments cmdProc -info "Command Description" \
-define_args \
{{-string "String help" "string_val" string optional}}
```

```
{-integer "Int help" "int_value" int optional}

{-list "List help" "list_value" list {optional bind_option -Bool}}

{-boolean_a "BoolA help" "" boolean {optional mutual_exclusive_group g0}}

{-boolean_b "BoolB help" "" boolean {optional mutual_exclusive_group g0}}

{-float_num "Float help" "float_value" float}

{-oosa "One of StringA help" "one_of_str_value" one_of_string {optional value_help {values {v1 v2}}}}

{-oosb "One of StringB help" "one_of_str_value" one_of_string {optional {values {v4 v5}}}}

}
```

Now, if the `cmdProc` procedure is invoked using the following command at the command prompt, argument validation takes place and the following errors are reported.

```
tempus> cmdProc -boolean_a -boolean_b

**ERROR: (Tempus-39): Options '-boolean_a -boolean_b' are mutually exclusive for 'cmdProc'.

Usage: cmdProc [-string string_val] [-integer int_value] [-list list_value] [-boolean_a ]
[-boolean_b ] [-float_num float_value] [-oosa one_of_str_value {v1 v2 }] [-oosb
one_of_str_value]]

**ERROR: (Tempus-27): Errors in 'cmdProc'.
```

The following command to invoke the `cmdProc` procedure will also return the errors shown below.

```
tempus> cmdProc -oosa v5

**ERROR: (Tempus-42): The arguments specified (v5) in cmdProc -oosa are not valid. Refer to
the documentation for valid arguments.

Usage: cmdProc [-string string_val] [-integer int_value] [-list list_value] [-boolean_a ]
[-boolean_b ] [-float_num float_value] [-oosa one_of_str_value {v1 v2 }] [-oosb
one_of_str_value]]

**ERROR: (Tempus-27): Errors in 'cmdProc'.
```

define_proc_arguments

```
define_proc_arguments
[-help]
proc_name
[-info info_text]
[-define_args arg_defs]
[-hide]
```

Defines the arguments and attributes of a Tcl procedure. The arguments and attributes are displayed when you view the help associated with the procedure.

The `define_proc_arguments` command, when used with the `parse_proc_arguments` command, enables you to validate command usage. For invalid commands, appropriate error messages are displayed.

Parameters

-help	Prints out the command usage.
proc_name	Specifies the name of an existing Tcl procedure.
-info info_text	Provides help information for the procedure.
-define_args arg_defs	Defines all possible arguments of the Tcl procedure. It can also be used to define the help text and constraints for individual arguments of the procedure and generates the help for command options. The variable <code>arg_defs</code> is a list of lists where each list element defines one argument. Each element in the list has the following format: <pre>"arg_name" "option_help" "value_help" "data_type" "attributes"</pre>
	arg_name: Specifies the name of the argument.
	option_help: Provides a short description of the argument.
	value_help: Specifies the help information for the associated option values.
	data_type: (Optional) Used for validation of options. Supported data types are <code>string</code>, <code>list</code>, <code>boolean</code>, <code>int</code>, <code>integer</code>, <code>float</code>, or <code>one_of_string</code>. Default: <code>string</code>

	<i>attributes:</i> (Optional) Used for validation of options. The attributes can be: • <code>required</code>: This argument must be specified . This is mutually exclusive with <code>optional</code> and <code>internal</code>. • <code>optional</code>: Specifying this argument is optional. This is mutually exclusive with <code>required</code>. • <code>internal</code>: Disables the display of help information for the option in the procedure help. This argument is mutually exclusive with <code>required</code>. • <code>value_help</code>: Indicates that the valid values for <code>one_of_string</code> argument should be listed whenever argument help is shown. • <code>values {allowable_values}</code>: This argument must be used with the <code>one_of_string</code> data type. • <code>merge_duplicates</code> : Ensures that when the option appears more than once in a command, its values are concatenated into a list of values. The default behavior is that the right-most value specified for the option is used. • <code>bind_option other_arg_name</code>: Binds the current option with the option specified as the <code>other_arg_name</code> variable. • <code>mutual_exclusive_group group_name</code>: Defines a group name and includes the current option in the <code>group_name</code> group. All options in the same group are treated as mutually exclusive. • <i>Default</i>: <code>optional</code>
<code>-hide</code>	Hides the procedure and its body.

Examples

The following Tcl procedure uses the `define_proc_arguments` command for defining arguments and attributes, and for validating the command usage.

```
proc cmdProc {args} {
  parse_proc_arguments -args $args results
  foreach argname [array names results] {
    puts "$argname = $results($argname)"
  }
}
```

```
define_proc_arguments cmdProc -info "Command Description" \  
-define_args \  
{ {-string "String help" "string_val" string optional} \  
{-integer "Int help" "int_value" int optional} \  
{-list "List help" "list_value" list {optional bind_option -Bool}} \  
{-boolean_a "BoolA help" "" boolean {optional mutual_exclusive_group \  
g0}} \  
{-boolean_b "BoolB help" "" boolean {optional mutual_exclusive_group \  
g0}} \  
{-float_num "Float help" "float_value" float} \  
{-oosa "One of StringA help" "one_of_str_value" one_of_string \  
{optional value_help {values {v1 v2}}}} \  
{-oosb "One of StringB help" "one_of_str_value" one_of_string \  
{optional {values {v4 v5}}}} \  
}
```

Now, if the `cmdProc` procedure is invoked with the `-help` option at the command prompt, the following help information is displayed.

```
tempus> cmdProc -help  
Usage: cmdProc # Command Description  
[-string string_val] (String help)  
[-integer int_value] (Int help)  
[-list list_value] (List help, Bind_Option=-Bool)  
[-boolean_a ] (BoolA help, Mutual_Exclusive_Group=g0)  
[-boolean_b ] (BoolB help, Mutual_Exclusive_Group=g0)  
[-float_num float_value] (Float help)  
[-oosa one_of_str_value] (One of StringA help, Values={v1 v2 })  
[-oosb one_of_str_value] (One of StringB help)
```

is_collection_object

is_collection_object
[-help]
collection

Returns a value of `true` if the specified object is a collection, otherwise `false` is returned.

Parameters

-help	Prints out the command usage.
collection	Specifies the collection to be checked.

Examples

- The following example shows how the `is_collection_object` command can be used to check for collection objects:

```
set cells [get_cells]
set pins [get_pins]
set nets [get_nets]
set paths [report_timing -max_paths 5 -coll]
set heterogenColl ""
append_to_collection heterogenColl $cells
append_to_collection heterogenColl $pins
append_to_collection heterogenColl $nets
append_to_collection heterogenColl $paths
set name "123"
```

'1' is returned for all of the following 'is_collection_object' commands

```
is_collection_object $cells
is_collection_object $pins
is_collection_object $nets
is_collection_object $paths
is_collection_object $heterogenColl
```

'0' is returned for these 'all is_collection_object' commands

```
is_collection_object $name
is_collection_object [get_cells xyz* -quiet]
```

Related Commands

- `sizeof_collection`

ART Based Flow Commands

- [get_module_view](#)
- [set_module_view](#)

get_module_view

```
get_module_view
[-help]
[-top_read_only]
[-hinsts list_of_partition_hinsts]
[-partitions list_of_partitions]
[-tcl_list]
```

Verifies the FlexView mode.

Parameters

-help	Outputs a brief description that includes the type and default information for each <code>get_module_view</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man get_module_view</code>
- <i>hinsts list_of_partition_hinsts</i>	Lists partition hinsts.
-partitions <i>list_of_partitions</i>	Lists partitions.
-top_read_only	Specifies if top level is readOnly.
-tcl_list	Displays the current settings for the specified parameters in Tcl list format only. If you specify <code>-tcl_list</code> without any parameters, the software displays the current settings of all <code>set_module_view</code> parameters in Tcl list format.

Examples

- The following command verifies the FlexView mode:

```
get_module_view
```

```
{TOP all}  
{coreinst/ks_core1/amba_dsp1/ram2p_78kx32 readOnly}  
{coreinst/ks_core1/leon1 interface}
```

Related Information

- [set_module_view](#)

set_module_view

```
set_module_view  
[-help]  
[-top_read_only {true | false}]  
[-hinsts {list_of_partition_hinsts}]  
[-partitions {list_of_partitions}]  
[-type {readOnly|interface|all}]
```

Specifies the FlexView (`readOnly|interface|all`) for the top level and each of the partitions. This way optimization can be limited to the selected sections of the partitions and the top-level logic.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>set_module_view</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man set_module_view</code>.
<code>-top_read_only {true false}</code>	Sets the top level to the read-only mode. By default, optimization can change the logic at the top level to improve timing. By setting this option to <code>true</code>, no change will be done to the entire top-level logic. <i>Default:</i> <code>false</code>
<code>-hinsts</code> <code>list_of_partition_hinsts</code>	Applies the selected FlexView mode to the instance name or list of instance names of partitions.
<code>-partitions</code> <code>list_of_partitions</code>	Applies the selected FlexView mode to a partition or list of partitions. You have a choice to either specify the instance name of the partition or just the partition itself.
<code>-type</code> <code>{readOnly interface all}</code>	Specifies the FlexView mode for the specified partition(s). • <code>readOnly</code> : Specifies that the optimization will not be performed inside the partition. • <code>interface</code>: Specifies that optimization will be restricted only to the interface logic of the partition. • <code>all</code> : Specifies that optimization will be done for the entire partition.

Example

The following commands sets the top level to the read-only mode:

```
set_module_view -top_read_only true
```

add_thru_substrate_insts

```
[-help]  
[-driver_thru_substrate_cell cell1]  
-load_thru_substrate_cell cell2  
-net net  
[-redraw]  
[-selected]  
[-shared_load_thru_substrate_cell]
```

Adds thru-substrate instances to a net to specify two-sided routing for a critical net (backside routing has lower RC than frontside routing). All pins or ports of the net must be on the front side, and as an exception, one backside port is allowed. A thru-substrate instance is a device that tunnels through the substrate to connect frontside routing with backside routing.

The driver thru-substrate instance is placed on top of the driver and a load thru-substrate instance is placed on top of its load. If a load thru-substrate instance drives multiple loads, it is placed in the center of the group of loads. It means that all instances with a pin on the net must be placed, and if the net has ports, they must also be placed before when the thru-substrate instances can be added to the net. Hence, this command creates unallowed placement that needs to be resolved with the `place_detail` command.

When a net has a backside port with everything else on the front side, this command creates one thru-substrate instance placed on top of the backside port, so that the net's frontside routing can be brought

to the backside, typically to connect to a backside bump. For this usage, specify the same value for the `-load_thru_substrate_cell` and `-driver_thru_substrate_cell` parameters.

Use this command to create one FTV for a net with multiple FS leaf pin, multiple FS port(s), and/or a single BS port.

 FTV is placed on the top of the BS port.

Parameters

<code>-help</code>	Prints a brief description that includes the type and default information for each <code>add_thru_substrate_insts</code> parameter. For a detailed description of the command and all its parameters, use the man command: <code>man add_thru_substrate_insts</code>
<code>-driver_thru_substrate_cell cell1</code>	Specifies the thru-substrate macro/cell to instantiate a thru-substrate instance, whose front pin is to be routed to the driver.
<code>-load_thru_substrate_cell cell2</code>	Specifies the thru-substrate macro/cell to instantiate a thru-substrate instance(s), whose front pin(s) is to be routed to load(s).
<code>-net net</code>	Specifies the net to add thru-substrate instances on both sides, front and back.
<code>-redraw</code>	Redraws the graphics window.

<code>-selected</code>	Groups the loads where each group will have its own <code>load thru-substrate</code> instance. • When the <code>-selected</code> and <code>-load_thru_substrate_cell</code> parameters are specified, the only driver <code>thru-substrate</code> instance is first created and the selected loads either share one <code>load thru-substrate</code> instance or get their own <code>load thru-substrate</code> instances. Additionally, the unselected loads are driven directly by the net driver. • In case the <code>-selected</code> parameter is specified and the <code>-load_thru_substrate_cell</code> parameter is not specified, each selected load driven by the net driver is reconnected to a new <code>load thru-substrate</code> instance. This may be shared through the <code>-shared_load_thru_substrate_cell</code> parameter, which is driven by the driver <code>thru-substrate</code> instance. This process repeats until the loads are grouped as desired.
<code>-shared_load_thru_substrate_cell</code>	Loads share one <code>thru-substrate</code> instance (one <code>thru-substrate</code> instance for each load, if not specified).

Related Topics

[delete_thru_substrate_insts](#)

compress_special

```
compress_special
[-help]
[-area {x1 y1 x2 y2}]
[-incremental]
[-layers layer+]
[-nets net+]
```

Compresses Power-Grid (PG) based on the specified area, layer, or net.

Parameters

-help	Prints a brief description that includes the type and default information for each <code>compress_special</code> parameter. For a detailed description of the command and all its parameters, use the <code>man</code> command: <code>man compress_special</code>
-area {x1 y1 x2 y2}	Specifies the coordinates for the area from which PG needs to be compressed. The <code>compress_special</code> command compresses only those special wires and special vias, which exist within the area specified by this parameter. <i>Default:</i> All PG structures are compressed.
-incremental	Recompresses the PG after editing the PG wires or vias. This parameter can only be specified when the current design is in compressed mode.
-layers layer+	Specifies the layers on which PG compression is needed. This parameter requires either LEF layer names or a routing layer index value (for example, <code>1</code> for the first routing layer, <code>2</code> for the second routing layer, and so on).
-nets net+	Specifies the nets from which PG compression is needed. If the specified net does not have any special route on it, it is ignored.

Example

The following command compresses %s special_wires and %s special_vias:

```
compress_special -area {100 100 120 120} -net VDD -incremental
```

Related Topics

[decompress_special](#)

convert_dbu_to_um

```
convert_dbu_to_um
[-unit number]
{int | {int_list}}
```

Takes an arbitrary list of ints and returns it in the same form, with each database integer *int* converted to its user unit floating point equivalent.

Parameters

<code>-unit <i>number</i></code>	Specifies the convert factor by which to divide the database integer <i>int</i>. <i>Value:</i> One of 100, 200, 1000, 2000, 10000, or 20000 <i>Default:</i> Uses the LEF <code>UNITS DATABASE MICRONS</code> int from the Tempus database technology file, or the OpenAccess equivalent.
<code>{<i>int</i> {<i>int_list</i>}}</code>	
	Specifies the int or int list to convert. You can specify a single int, or an arbitrary list of ints, including points, rectangles and coordinates. <i>Type:</i> Integer

Examples

- The following command converts the database int 100 into its equivalent user unit int, based on a convert factor of 2000:

```
convert_dbu_to_um -unit 2000 100
```

The software returns the following information:

```
0.050
```

- The following command converts the database ints for the list of numbers {1000 1000 2000 2000} into their equivalent user unit ints, based on a convert factor of 1000:

```
convert_dbu_to_um -unit 1000 {1000 1000 2000 2000}
```

The software returns the following information for the list of numbers. The list is implied, but not shown.

```
1.000 1.000 2.000 2.000
```

Related Commands

`convert_um_to_dbu`

convert_um_to_dbu

```
convert_um_to_dbu  
[-unit number]  
{double | {double_list}}
```

Takes an arbitrary list of doubles and returns it in the same form, with each user unit floating point double converted to its database integer double equivalent.

Parameters

<code>-unit <i>number</i></code>	Specifies the convert factor by which to multiply the user unit double. <i>Value:</i> One of 100, 200, 1000, 2000, 10000, or 20000 Default: Uses the LEF <code>UNITS DATABASE MICRONS</code> double from the Tempus database technology file, or the OpenAccess equivalent.
<code>{<i>double</i> {<i>double_list</i>}}</code>	
	Specifies the double or double list to convert. You can specify a single double, or an arbitrary list of doubles, including points, rectangles and coordinates. <i>Type:</i> Float

Examples

- The following command converts the user unit double 30 into its equivalent database integer double, based on a convert factor of 2000:

```
convert_um_to_dbu -unit 2000 30
```

The software returns the following information:

```
60000
```

- The following command converts the user unit doubles for the list of numbers {30 40} into their equivalent database unit doubles, based on a convert factor of 200:

```
convert_um_to_dbu -unit 200 {30 40}
```

The software returns the following information for the list of numbers. The list is implied, but not shown.

```
6000 8000
```

Related Commands

`convert_dbu_to_um`

create_cell_obs

```
create_cell_obs
[-help]
-cell cell_name_or_pointer
[-ignore_pg_net]
-layer layer_name_or_pointer
[-mask int_value]
{{-rects {{llx1 lly1 urx1 ury1} {{llx2 lly2 urx2 ury2}}...} | -polygon {x1 y1 x2 y2 x3 y3 ...}}
[-spacing value | -design_rule_width value]
```

Helps in adjusting the database. The command works in memory and hence, must be used in each session before other commands are run.

It adds an obstruction geometry to a cell on the specified layer and is helpful when you want to add a temporary cell obstruction without changing the cell's LEF and reloading the Tempus.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>create_cell_obs</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man create_cell_obs</pre>
<code>-cell</code> <code>cell_name_or_pointer</code>	Specifies the cell name or pointer.
<code>-design_rule_width</code> <code>value</code>	Specifies the design rule width.
<code>-ignore_pg_net</code>	Ignores the Power/Ground routing while checking for DRC violations (including shorts) involving the added obs. This parameter is equivalent to <code>LEF MACRO OBS LAYER # EXCEPTPGNET</code>.
<code>-layer</code> <code>layer_name_or_pointer</code>	Specifies the layer name or pointer.
<code>-mask int_value</code>	Specifies the integer value of the mask (within the mask range) for the created OBS. <i>Default:</i> 0, which means that the mask is uncolored.
<code>-polygon {x1 y1 x2 y2</code> <code>x3 y3 ...}</code>	Specifies the polygon shape.
<code>-rects {{llx1 lly1</code> <code>urx1 ury1} {llx2 lly2</code> <code>urx2 ury2}...</code>	Specifies the Obs rect list for adding obstruction geometries.
<code>-spacing value</code>	Specifies the spacing value.

Related Commands

[delete_cell_obs](#)

db_hinst_connection

```
db_hinst_connection
[-help]
hInst hInst
```

Reports connections between two hinsts.

Parameters

-help	Outputs a brief description that includes the type and default information for each <code>db_hinst_connection</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man db_hinst_connection</code>
hInst	Specifies the address of the hierarchical instance.

decompress_special

```
decompress_special
[-help]
[-area {x1 y1 x2 y2}]
[-layers layer+]
[-nets net+]
```

Decompresses Power-Grid (PG) objects within the specified area, layer, or net. This command decompresses only the overlapped part in case of partial overlapping. The rest of the part is regrouped.

Parameters

<code>-help</code>	Prints a brief description that includes the type and default information for each <code>decompress_special</code> parameter. For a detailed description of the command and all its parameters, use the <code>man</code> command: <code>man decompress_special</code>
<code>-area</code> <code>{x1 y1</code> <code>x2 y2}</code>	Specifies the coordinates for the area from which PG needs to be decompressed. The <code>decompress_special</code> command decompresses only those special wires and special vias, which exist within the area specified by this parameter. <i>Default:</i> All PG structures are decompressed.
<code>-</code> <code>layers</code> <code>layer+</code>	Specifies the layers on which PG decompression is needed. This parameter requires either LEF layer names or a routing layer index value (for example, <code>1</code> for the first routing layer, <code>2</code> for the second routing layer, and so on).
<code>-nets</code> <code>net+</code>	Specifies the nets from which PG decompression is needed.

Example

The following command decompresses %s `special_wires` and %s `special_vias`:

```
decompress_special -area {100 100 120 120} -layer Via56
```

Related Topics

define_attribute

```
define_attribute
[-help]
attribute_name
-obj_type object_type
[-obsolete]
{-alias existing_attribute | {-category category [-data_type {bool | int | double | area |
coord | string | point | rect | line | delay | resistance | capacitance | voltage | in_dir |
out_dir | in_file | out_file | object | object*} [-enum_values values]]
[-check_function check_function]
[-compute_function compute_function]
[-default default]
[-help_string description]
[-hidden]
[-set_function set_function]
[-skip_in_db]]}
```

Creates a new, user-defined attribute with the specified characteristics.

The attribute value can be reset only if a default value is specified. For example, the following command defines a new instance attribute of integer type with a default value equal to 1:

```
define_attribute myattr -default 1 -obj_type inst -data_type int -help_string "my attribute"
-category mycat
```

Parameters

-help	Outputs a brief description that includes type and default information for each <code>define_attribute</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man define_attribute.</code>
-alias existing_attribute	Makes <i>attribute_name</i> a hidden alias for <i>existing_attribute</i> , which must have been defined. This parameter is used along with the <code>-obj_type</code> parameter. It could also be used with the <code>-obsolete</code> parameter to generate an obsolete warning.
attribute_name	Specifies the name of the attribute to be defined.

<code>-category category</code>	Specifies the category of the attribute. Categories group attributes that perform similar functions, whereas object types describe where in the design an attribute is valid. You can specify any category name, both new and existing category names are allowed.
<code>-check_function check_function</code>	Specifies a previously defined Tcl procedure's name to ensure that the newly defined attribute is valid. The Tcl procedure should be of the form <code>proc {object value}</code>.
<code>-compute_function compute_function</code>	Specifies a previously defined Tcl procedure's name to get the newly defined attribute's value later (with the <code>get_attribute</code> command). The Tcl procedure must be of the form <code>proc {object}</code>. When you use this option, the attribute becomes a read-only attribute because its value is always computed.
<code>-data_type {bool int double area coord string point rect line polygon delay resistance capacitance voltage in_dir out_dir in_file out_file}</code>	
	Defines the data type of the attribute. Possible data types are basic only, no objects.
<code>-default default</code>	Specifies a default value for the attribute. In case this parameter is not specified while creating an attribute, the default value will be: • <code>no_value</code> for simple numeric types such as <code>int</code>, <code>double</code>, <code>delay</code>, <code>capacitance</code>, <code>coord</code>, and <code>boolean</code> • <code>""</code> (empty string) for all other types, including <code>enum</code>, <code>string</code>, <code>in_file</code>, <code>out_file</code>, <code>in_dir</code>, <code>out_dir</code>, <code>point</code>, <code>rect</code>, <code>polygon</code>, <code>line</code>, and <code>obj_type</code>
<code>-enum_values values</code>	Specifies a list of all the possible values of the enumerated type. For example, <code>-enum_values {a b c}</code>.
<code>-help_string description</code>	Specifies the help text for the attribute.
<code>-hidden</code>	Specifies whether the defined attribute is a hidden attribute.

<code>-obj_type object_type</code>	Specifies the object type of the attribute. All valid object types can be found by typing <code>get_db obj_types .name</code> at the prompt. The attribute is assigned to the specified type.
<code>-obsolete</code>	Specifies if the defined attribute is obsolete.
<code>-set_function set_function</code>	Specifies a previously defined Tcl procedure's name. This option allows you to override user-defined values provided it conforms to the parameters in the Tcl procedure you created. The Tcl procedure should be of the form <code>proc {object new_value current_value}.</code> Returns new value assigned to the attribute.
<code>-skip_in_db</code>	Prevents the <code>write_db</code> command to write out the defined attribute.

Examples

- The following command creates a Tcl procedure, `check_fxn`, and then creates an attribute named `test_check`. The `-check_function` parameter is specified so that the `test_check` attribute can be tested for validity when it is specified later:

```
proc check_fxn {obj val} {
+ if {$val >0} { return 0}
+ return 1
+ }
define_attribute test_check1 -obj_type inst -data_type int -category test -help_string
"test_check_function" -check_function check_fxn
```

Based on the `check_function` parameter, the checking criteria attribute value can be set only to a negative value. As a result the following command sets the attribute value to -1:

```
set_db insts .test_check1 -1
```

but the following command displays an error and keeps the previous value.

```
set_db insts .test_check1 2
```

- The following command creates a Tcl procedure, `set_fxn`, and then creates an attribute named `test_set`. The `-set_function` parameter is specified so that you can change the value of the `test_set` attribute (provided it is valid):

```
{proc set_fxn {obj new_val cur_val} {
+ if {$new_val > $cur_val} {
+ return $new_val
```

```
+ }  
+ return $cur_val  
+ }  
+ }  
define_attribute test_set -obj_type root -data_type int -category test -help_string  
"test set function" -set_function set_fxn
```

Now, the following command sets the attribute value to 1 because the previous value was undefined

```
set_db test_set 1
```

The following command changes the Attribute value to 4 as the new value is greater than the current value

```
set_db test_set 4
```

But with the following command the value is not changed as the new value is less than the current value (4)

```
set_db test_set 2
```

- The following command uses the `compute_function` to set attribute values. Note that the attribute becomes read-only if `compute_function` is applied.

```
proc comp_func {obj} { return 5}  
define_attribute test_compute -obj_type root -data_type int -category test -help_string  
"test set function" -compute_function comp_func  
get_db test_compute 5
```

Now, the following command will issue an error as attribute value cannot be changed.

```
set_db test_compute 3
```

delete_cell_obs

```
delete_cell_obs
[-help]
-cells {base_cell | design | module}+
{-obs_shapes shape+ | [{-rects {{llx1 lly1 urx1 ury1} {llx2 lly2 urx2 ury2}...} | -polygon
{x1 y1 x2 y2 x3 y3 ...}] -layers layer+}
```

Helps in deleting an obstruction geometry for a cell on the specified layer. This command deletes only the obstruction geometry added by the `add_cell_obs` command.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>delete_cell_obs</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man delete_cell_obs</code>
<code>-cells cell_name_or_pointer</code>	Specifies the cell name or pointer.
<code>-layers layer_name_or_pointer</code>	Specifies the layer name or pointer.
<code>-rects {{llx1 lly1 urx1 ury1} {llx2 lly2 urx2 ury2}...}</code>	Specifies the Obs rect list for deleting obstruction geometries.
<code>-obs_shapes shape+</code>	Specifies the cell obstruction shape pointers. Note: This parameter must be used with the <code>-cells</code> parameter, and cannot be specified with any other parameter except than <code>-help</code> .
<code>-polygon {x1 y1 x2 y2 x3 y3 ...}</code>	Specifies the polygon shape.

Examples

Following is an example of using the `-obs_shapes` parameter for specifying the cell obstruction shape pointer:

- The BUFX1 cell has multiple obs shapes on different layers:

```
get_db base_cell:BUFX1 .obs_layer_shapes.shapes
```

```
shape:0x7f7f50db3b00 shape:0x7f7f50db3ae0 shape:0x7f7f50db3ac0 shape:0x7f7f50db3aa0  
shape:0x7f7f50db3a80
```

- The following command deletes the first two shapes in the list:

```
delete_cell_obs -obs_shapes {shape:0x7f7f50db3b00 shape:0x7f7f50db3ae0} -cells BUFX1
```

Related Commands

[create_cell_obs](#)

delete_floating_nets

`delete_floating_nets`

The `delete_floating_nets` command deletes all the nets with zero terms except for assign nets and p/g nets. It supports zero-term net deletion in multiple instantiated cells.

This command takes no parameters and can be used whenever the design is read in.

After the command is executed, it reports the following:

- Total number of dangling nets `nrDnet`
- Total number of deleted dangling nets `nrDdnet`
- Total number of nets `ntNet`
- Ratio of `nrDdnet` over `nrNet`
- Ratio of `nrDnet` over `nrNet`
- `nrDdnet` over `nrDnet`

Related Commands

[`report\_floating\_nets`](#)

delete_obj

```
delete_obj any_object +  
[-help]
```

Deletes one or more existing objects from the database. The command can delete **netlist** objects and physical data like **routing**, **floorplan**, and **DFT** objects, but not the **timing** objects (like **rc_corner**).

The following **obj_types** can be deleted through this command: **special_wire** | **special_via** | **place_blockage** | **route_blockage** | **pin_blockage** | **resize_blockage** | **text** | **gui_text** | **gui_line** | **gui_rect** | **gui_polygon** | **marker** | **row** | **bump** | **bus_guide** | **pin_guide** | **pin_group** | **net_group** | **group** | **flow** | **flow_step** | **wire** | **via** | **patch_wire** | **virtual_wire** | **port_shape** | **attribute** | **route_type** | **what_if_wire** | **what_if_via** | **hinst** | **hpin** | **hport** | **port** | **module** | **inst** | **net** | **hnet** | **sdp** | **formal_verification_constraint** | **test_signal** | **test_clock** | **test_clock_domain** | **port_bus** | **hport_bus**

Parameters

<code>-help</code>	Provides a brief description of the command that includes the type and default information for parameters. For a detailed description of the command and all its parameters, use the man command: <code>man delete_obj</code>
<code><i>any_object</i> +</code>	Specifies the object or the list of objects to be deleted.

Examples

- The following command deletes all the **place_blockages**:
`delete_obj [get_db place_blockages]`
- The following command deletes the specified **place_blockage** object:
`delete_obj place_blockage:0x2b77dfbf0048`
- The following command deletes all the special routes from the VDD net:
`set my_net [get_db pg_nets VDD]
delete_obj [get_db $my_net .special_wires]
delete_obj [get_db $my_net .special_vias]`
- The following command deletes a group of SDPs:
`delete_obj sdp:DTMF_CHIP/wCardInstGrp_1`

Related Commands

- `define_attribute`
- `get_db`
- `reset_db`
- `set_db`

delete_thru_substrate_insts

```
delete_thru_substrate_insts
[-help]
{-net net_name}
```

Deletes thru-substrate instances for the specified net. A thru-substrate instance is a device that tunnels through a chip to connect frontside routing with backside routing.

Parameters

-help	Prints a brief description that includes the type and default information for each delete_thru_substrate_insts parameter. For a detailed description of the command and all its parameters, use the man command: <pre>man delete_thru_substrate_insts</pre>
-net net_name	Specifies the net whose thru-substrate instances are to be deleted.

Related Topics

```
add_thru_substrate_insts

get_computed_shapes

```
get_computed_shapes
[-help]
[-dbu]
[-step step]
[-output polygon|rect|hrect|area]
shape_list [AND shape_list | ANDNOT shape_list | OR shape_list | XOR shape_list
| INSIDE shape_list | OUTSIDE shape_list | ENCLOSE shape_list | STRADDLE shape_list
| BBOX | HOLES | NOHOLES | MOVE {dx | SIZE value | SIZEX value | SIZEY value} ...
```

Performs geometric (SIZE and BBOX) and logical (AND, ANDNOT, etc) operations on shape (polygon or a rectangle or a list of rectangles and polygons).

Parameters

-help	Prints a brief description that includes type and default information for each <code>get_computed_shapes</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <pre>man get_computed_shapes</pre>
-dbu	Specifies values in database units, specified in integers. All <code>shape_list</code> values as well as values for MOVE, SIZE, and step should be using units consistent with the <code>-dbu</code> setting. The output units are the same as the input units. <i>Default:</i> Specifies values in user units, in microns.
-step	Specifies step size if output format is rect, required to convert non-orthogonal shapes into series of rectangles. <i>Default:</i> minwidth value of first routing layer. The option is coord, and is optional.
-output <i>polygon rect hrect area</i>	
	Specifies the output format. <code>rect</code>: Vertical rectangles <code>hrect</code>: Horizontal rectangles <code>area</code>: Total area of final shape <i>Default:</i> rect (string)

<code>shape_list</code>	A polygon or rectangle or a list of polygon and rectangle. • polygon: <code>{{x y} {x y} {x y} ... }</code>; • rect: <code>{x1 y1 x2 y2}</code> This option is a required list.
<code>AND shape_list</code>	Is a binary operator that is the intersection of <code>shape_lists</code>
<code>ANDNOT shape_list</code>	Is a binary operator which defines the initial <code>shape_list</code> minus <code>shape_list</code>
<code>OR shapelist</code>	Is a binary operator of the union of shapelists
<code>XOR shape_list</code>	Is a binary operator of the <code>shape_list</code> : OR minus AND. It is a string and is optional.
<code>INSIDE shape_list</code>	Is a binary operator for initial shapes that are inside (including touching) of one of the shapes from the second list.
<code>OUTSIDE shape_list</code>	Is a binary operator for initial shapes that are outside (including touching) of one of the shapes from the second list.
<code>ENCLOSE shape_list</code>	Is a binary operator for initial shapes that completely enclose at least one shape from the second list.
<code>STRADDLE shape_list</code>	Is a binary operator for initial shapes that are partially inside and partially outside at least one shape from the second list.
<code>MOVE {dx dy}</code>	Is a unary operator that moves the by <code>{dx dy}</code>
<code>BBOX</code>	Is a unary operator that computes the bounding box of <code>shape_list</code> . This is a string and optional.
<code>HOLES</code>	Is a unary operator that gives list of new shapes that fill holes in the original <code>shape_list</code> .
<code>NOHOLES</code>	Is a unary operator that gives list of new shapes that include filled holes in the original <code>shape_list</code>. This is same as <code>get_computed_shapes shape_list HOLES OR shape_list</code>
<code>SIZE value</code>	Is a unary operator that increases the size of <code>shape_list</code> by <code>value</code> .
<code>SIZEX value</code>	Is a unary operator that increases the size of list of shapes in the X-direction by <code>value</code>
<code>SIZEY value</code>	Is a unary operator that increases the size of list of shapes in the Y-direction by <code>value</code>

Note: All shapes processed by `get_computed_shapes` must be non-zero area. If a *shape_list* contains a list of rectangles and one of them is zero-area, it will be dropped.

Also, during negative sizing or other operations, if a zero-area shape is created, it will be dropped from the output (or intermediate results).

For example, a rectangle that is 4x4 or smaller will disappear when using `get_computed_shapes $rect SIZE -2 SIZE 2` while shapes larger than 4 will be returned to their original state.

The same is true for protrusions with width less than 4.

Examples

- **Unary:**

- **Binary:**

- **Combination:**

Example: Area calculation

`get_computed_shapes $shapes1 AND $shapes2`

Returns intersection (as a list of rectangles) between the shapes in the `$shapes1` and `$shapes2` lists.

`get_computed_shapes -output area $shapes1 AND $shapes2`

Returns intersection area between the shapes in the `$shapes1` and `$shapes2` lists.

get_db

```
get_db
[-help]
{[start [chain] [pattern1 [pattern2 ..] [[-if expression] | [-expr expression]] [-dbu] [-
foreach tcl_body] [-index {object | obj_type1 name1 [object | obj_type2 name2 ...]]] [-invert]
[-regexp] [-match_hier] [-unique] [-computed]]}
[-category category]
[-depth {[min] max}]
[-quiet | -skip_fail]
```

Returns objects and attributes in the database with different types of filtering. The `get_db` command takes a dual-ported object, dual-ported object list or a collection as input, then uses a period (.) to traverse to other related objects or to access attributes. You can use additional periods to traverse the data base schema.

Note: A Dual-Ported Object (DPO) is a `Tcl_Obj` in the C++ programming interface. The pointer is kept as a C++ pointer inside Tcl unless Tcl forces it to be evaluated as a string. In normal usage it never gets converted to a string which is more efficient, but if you do a “puts \$var” or return the value to the shell, it will be converted to its “dual” string form.

- The string form is normally a useful name preceded by the `obj_type`, so a `base_cell` object string form might look like `base_cell:and2`.
- A netlist name will have the current design name included, so an instance named `i1/i2` in design `top`, would look like `inst:top/i1/i2`.
- An object with no name like a wire, will just show the pointer hex-value like `wire:0x22222`.

The `get_db` command accepts collections as an input but it only returns objects in dual-ported object list form.

For descriptions on all objects and attributes, see [Common UI Database Object Information](#).

The root object has the current design data under the `current_design` attribute, while technology and library data are normally directly accessible as root attributes (e.g. `layers` and `base_cells`). The `root` object is the default starting point if there is no input list or collection given.

You can query a root attribute in any of the following ways:

- `get_db / .layers`
where, ‘/’ is the notation for the root object

- `get_db layers`

This implicitly starts at the root. In this usage, no “.” is used before the “layers” attribute name.

For example, you can use the following command to get all the driver-pins of all nets in `current_design`:

```
>get_db current_design .nets.drivers
```

Note: The `current_design` is implicitly created by the `init_design` or the `read_db` commands.

Frequently used `current_design` attributes like `insts` or `hinsts` (hierarchical `insts`) have root attribute aliases (or shortcuts). These attributes can be accessed by just typing the root attribute alias name. For example, the following commands gets all instances of the current design with names that start with `i1/i2*`:

- `get_db current_design .insts i1/i2*`
- `get_db insts i1/i2*`

Where, `insts` is a root attribute alias for `current_design .insts`

Some of the more commonly used aliases from the `current_design` attributes include: `nets`, `pins`, `insts`, `hnets`, `hpins`, and `hinsts`.

The `get_db` command supports auto-complete when you press the `<Tab>` key. It will give a list of all matching attributes starting with the letters entered so far, or it will complete the name if it is unique.

For example:

```
get_db insts .par<Tab>
parent partition
```

If you press the `<Shift+Tab>` keys together, the matching attributes are displayed along with their help string, like this:

```
>get_db insts .par<Shift+Tab>

parent # The parent of the inst, which is either a hinst for an instance within hierarchy or
the design object for an instance at the toplevel.
partition # If this inst is a physical black_box, this partition will carry the pin
constraints and related data for the blackbox. Otherwise it is empty.
```

There are two database definition objects: `obj_type` and `attribute`. If you want to query all the details for an attribute definition on an `obj_type`, rather than an attribute value, use the following command:

```
>get_db attribute:<obj_type>/<attribute_name> .*
```

You can use `get_db` to query user-defined properties from LEF. Following is the mapping between the LEF `objectType` and database object:

```
LAYER -> layer
LIBRARY -> design
MACRO -> base_cell
NONDEFAULTRULE -> route_rule
PIN -> base_pin
VIA -> via_def
VIARULE -> via_def_rule
```

Note: If `PROPERTYDEFINITION` is defined for `LIBRARY`, the `PROPERTY` will be mapped as a design attribute with a `tech_lef_property_*` prefix.

Note: The Tempus software does not support copy-pasting of text containing pointers. The following should not be copied within the same or different terminal:

- part of a pointer
- pointer from one session to another session
- dynamic object pointer released after a command

Note: For better performance, it is recommended to use the `get_property` and `get_<object>` commands for object search in timing constraints and custom reports.

Parameters

<code>-help</code>	Outputs a brief description that includes the type and default information for each <code>get_db</code> parameter.
<code>-category category</code>	Specifies a category of root attributes to return. This is intended to return all the root attributes associated with one application category. You cannot use a <i>start</i> argument with the <code>-category</code> option, so this option cannot be used for anything but root attributes. The return value is list of root attribute names. Example: The following command can be used to see all the root attributes associated with the category place: <pre>get_db -category place</pre> The output is as follows: <pre>place_design_floorplan_mode place_design_refine_place place_detail_allow_border_pin_abut ...</pre> You can view the complete list of categories with the <code>get_db categories</code> command as follows: <pre>get_db categories</pre> <pre>active_logic_view add_endcaps add_fillers add_rings ...</pre>

chain

Specifies the *chain* in the form `[.attribute_name1
[.attribute_name2]...]`. A chain always starts with a ".".

The specified attribute names are valid for each level of the traversal in the *chain*.

Example:

The following command returns the names of pins of `$my_insts`

```
get_db $my_insts .pins.name
```

If the chain has a * or ? in the attribute name, it will be expanded to all matching attribute names, and the display will show the attribute name and current value for every object. This is intended for interactive usage, and no values are returned to Tcl. Values that may require significant time to compute (like timing data that requires the timing-graph) will only be displayed if `-computed` is given.

For example:

```
get_db $my_insts .b*
```

```
Object: inst:top/i1
```

```
base_cell: base_cell:BUFX2
```

```
bbox: {34.32 10.08 38.94 15.12}
```

```
Object: inst:top/i2
```

```
...
```

-computed	Forces <code>get_db</code> to output the values of attributes that may require significant time to compute (like timing data that requires the timing-graph) when browsing many attributes at the same time. This is intended for interactive usage when using a pattern match with <code>*</code> or <code>?</code> for an attribute name. If only a single attribute name is given, then the value is always returned. Example: <pre>>get_db \$my_pins .slack_max* Object: pin:top/inst\$odd/Y slack_max: NC slack_max_edge: NC ... >get_db \$my_pins .slack_max* -computed #if timing-graph not available yet, it will be computed Object: pin:top/inst\$odd/Y slack_max: 550.12 slack_max_edge: rise ... >get_db \$my_pins .slack_max #single attribute names always return value and force computation if needed 550.12 ...</pre>
-dbu	Indicates that attribute values (coord, pt, rect, polygon, area, ...) should be returned as an int in database units. <i>Default:</i> If not given, the value returned is a double in microns (or microns**2). Examples: • In the following command the return type is a double in microns. <pre>get_db \$my_inst .location {1.0 1.0}</pre> • In the following command the return type is an int in database units. <pre>get_db -dbu \$my_inst .location {1000 1000}</pre>

<code>-depth {[min] max}</code>	Specifies the hierarchy depth range. It expands each <code>design</code> or <code>hinst</code> object in the input list into a list of <code>design</code> or <code>hinst</code> objects by descending the <code>hinst</code> hierarchy from <code>min</code> to <code>max</code> depth. The default value of <code>min</code> is 0, if not specified. 0 here signifies the level of the starting object. The <code>-depth</code> expansion happens first, and the resulting expanded list is then processed as the input list of objects by <code>get_db</code>. For example: <pre>get_db hinst:top/h1 -depth {0 1}</pre> Returns <code>hinst:top/h1</code>, and the first level of <code>hinsts</code> below it.
<code>-expr expression</code>	Returns the object if the <code>expression</code> is true. The <code>expression</code> argument is a strict Tcl expression that can be passed as is to the Tcl expression command. It has a pre-defined Tcl array named <code>\$obj</code> that is populated by <code>get_db</code> with any attribute or chain value for each object as they are visited, and <code>\$obj(.)</code> returns the object itself. For example, <pre>get_db insts -expr {\$obj(.base_cell.name) eq "AND2"} #all insts that are AND2</pre> Normally the <code>-if expression</code> parameter is faster for simple expressions, but it is limited to a few operators, and simple <code>\$var</code> substitution. If you need a full Tcl expression semantics including the proc calls inside [], special char escaping, or complex <code>\$var</code> substitution, you must use <code>-expr</code>. This parameter can be used with a <code>chain</code> and <code>pattern</code> like this: <pre>get_db \$my_insts .pins i1/* -expr {\$obj(.base_name) eq "A"}</pre> Here, the <code>i1/*</code> pattern is checked first for pin names that match <code>i1/*</code>, then the pin <code>.base_name</code> is checked if it is equals "A". <code>-expr</code> cannot be used at the same time with <code>-if</code>.

<code>-foreach tcl_body</code>	Specifies a list of Tcl commands to process for each object. This parameter avoids the overhead of creating long lists of objects. The Tcl array <code>\$obj()</code> is populated with the attributes of each object when it is visited, and <code>\$obj(.)</code> is the object itself. The Tcl commands <code>break</code> and <code>continue</code> also work as expected in a <code>foreach</code> loop (<code>break</code> stops the traversal of any more objects and <code>get_db</code> returns). Unlike inside <code>-if</code>, the <code>tcl_body</code> is strict Tcl. The <code>.attribute</code> names are not substituted, you must use <code>\$obj()</code> to access the attribute values instead. If you have a <code>pattern</code> or <code>-if</code>, or <code>-expr</code> usage, then <code>-foreach</code> only processes each object that matches the <code>pattern</code>, <code>-if</code>, or <code>-expr</code> expression. The following command prints the names of every inst that starts with "abc" and is an AND2 gate: <pre>get_db insts abc* -if {.base_cell.name == AND2} -foreach {puts \$obj(.name)}</pre> It returns the total number of <code>insts</code> that are printed.
<code>-if expression</code>	Specifies a boolean expression, with extensions to make pattern matching simpler. • <code>==</code> and <code>!=</code> do not require a quoted string, and they support pattern matching with <code>*</code> and <code>?</code>. • Other operators like <code>></code>, <code><</code>, <code><=</code>, <code>>=</code>, <code>&&</code>, <code> </code>, and the unary negate operator <code>!</code> are supported. • Parentheses <code>"()"</code> can be used to group complex expressions. Note: Unlike the <code><pattern></code> argument, inside the <code>-if</code> expression, you cannot use a string pattern to implicitly match the <code>.name</code> attribute of an object. You must use the <code>.name</code> field directly. For example, the following command will not match anything because <code>.base_cell</code> will become something like <code>base_cell:AND2</code>. <pre>get_db insts -if {.base_cell == buf*} #matches nothing</pre> use either of these instead: <pre>get_db insts -if {.base_cell.name == buf*} #match the .name attribute</pre> <pre>get_db insts -if {.base_cell == base_cell:buf*} #match the DPO name directly</pre> Note: If you use an attribute that is an object list (like <code>.pins</code>), every object in the list is tested in an "implicit OR", so if any of them pass, the expression is matched.

Handling of indexed attributes inside of the `-if` statement:

- The `-index` option is kept outside of the `-if` statement
- The `-index` option MUST be valid for ALL attributes inside the `-if` statement otherwise an error occurs

Examples:

- The following command finds all instances with `base_cell` names that matches "buf*".

```
get_db insts -if {.base_cell.name == buf*}
```

- The following command returns all insts that have one or more pins that match `CLK*`. Only one copy of the matching inst object is returned, even if multiple pin names match `CLK*`.

```
get_db insts -if {.pins.base_name == CLK*}
```

- The following command gets all pins where `delay_max_rise` is greater than 5 or `slew_max_fall` is smaller than 8. This is a valid command as both `delay*` and `slew*` are attributes indexed by `view` (`view` is a legal abbreviation of `analysis_view`).

```
get_db pins -if {.delay_max_rise > 5 || .slew_max_fall < 8 } -  
index {view v1}
```

Note: The `-if` parameter does not support the usage of embedded Tcl command as operands. Use the `-expr` for this requirement.

<pre>-index {object obj_type1 name1 [object obj_type2 name2 ...]}</pre>	Some attributes represent an array of values. For example, a pin <code>.slack_max_rise</code> attribute has a different value for each <code>analysis_view</code> and each <code>clock</code> that can affect that pin. With no index, a default method defined for that attribute is used (for example, the maximum, or minimum of all values in the array). For <code>slack_max_rise</code> with no <code>-index</code> value, the value returned is the worst-case slack across all <code>analysis_views</code> and <code>clocks</code>. If you want to return a specific value, you must include the index value. The index values are object pointers, or a pair of <code>obj_type</code> name and object name (for example <code>clock clk1</code>). The word <code>view</code> is accepted as an abbreviation for <code>analysis_view</code>. For example: <pre>get_db \$my_pins .slack_max_rise -index "view func_wc_cworst"</pre> Will return the worst case <code>.slack_max_rise</code> for the <code>analysis_view</code> <code>func_wc_cworst</code> across all <code>clocks</code>. This attribute also accepts a <code>clock</code> index, so you can further refine it like this: <pre>get_db \$my_pins .slack_max_rise -index "view func_wc_cworst clock clk1"</pre> To get the value for that specific <code>analysis_view</code> and <code>clock</code>. In the special case of a <code>clock</code> and <code>analysis_view</code> as shown above, a <code>clock</code> object is sufficient for both, because a <code>clock</code> object is based on both the <code>clock</code> name and the <code>view</code> name. So you could also do this: <pre>set my_clk_obj [get_db clocks -if {.view_name == func_wc_worst && .base_name == clk1}] get_db \$my_pins .slack_max_rise -index \$my_clk_obj</pre> The <code>-index</code> parameter also accepts a pattern of attribute name to be matched. While specifying an attribute pattern string with <code>-index</code>, attributes that do not support <code>-index</code>, will return their normal value. But the attributes that support <code>-index</code> will return the values specified by the index. For example: <pre>get_db net:dtmf_recvr_core/scan_out2 .* -index {view func- wc_cworst}</pre> Will return all the attributes and values for the <code>net</code> object. Any attribute that supports a <code>view</code> index will return the value for that <code>view</code>, while the other attributes will return the value as if <code>-index</code> was not specified.
<pre>-invert</pre>	Negates the <code>pattern</code>, <code>-if expression</code>, and <code>-expr expression</code> filters to return the objects/attributes that do not match instead of the ones that do.

<code>-match_hier</code>	Specifies that the <code>*</code> in the <i>pattern</i> and <i>expression</i> expands to the next hierarchical divider character <code>/</code> instead of a complete string match. Example: The following command matches <code>i1</code>, <code>i2</code>, but not <code>i1/i2</code>. <pre>get_db insts i* -match_hier</pre>
<code>pattern1 [pattern2 ...]</code>	Specifies string pattern(s), where: <code>*</code> matches 0 or more of any characters <code>?</code> matches exactly one character More complex patterns require <code>-regexp</code> or <code>-if</code> expression. Refer to the following examples: - The following command finds all instance names starting with <code>A</code>: <pre>get_db insts .name A*</pre> <pre>A0 A1/A2 ...</pre> - The pattern matching can also work directly on a dual-ported object. In that case, it will match the <code>.name</code> attribute of the object, but return the object rather than the <code>.name</code> string. This matching works only for objects that have a <code>.name</code> attribute defined. For example, the following command finds all instance objects (not names) with a name starting with <code>A</code>: <pre>get_db insts A*</pre> <pre>inst:top/A0 inst:top/A1/A2 ...</pre> - The pattern matching can also work to match multiple lists of the name patterns. Refer to the following example: <pre>get_db insts */BC* *TC*</pre> <pre>CG/BC1 CG/BC2 TC1 TC2 TC3 TC4</pre> Note: For the special case where a pattern string starts with <code>'.'</code> you need to use an extra <code>'.'</code> (an empty attribute name) so that <code>'.text'</code> is treated as a pattern and not as an attribute name. - The following command finds all nets whose names equal to <code>.odd_name</code> <pre>get_db nets . .odd_name</pre> - The following command finds all instance names starting with <code>A</code> or <code>B</code>: <pre>get_db insts A* B*</pre>

-quiet	Prevents displaying warning and error messages while using the <code>get_db</code> command.
-regexp	Specifies that <i>pattern</i> use <i>regexp</i> syntax instead of the simple <code>*</code> and <code>?</code> style. It does not change the <code>-if</code> pattern matching. See the example below to understand the usage of the <code>-regexp</code> parameter: <pre>get_db insts -regexp {u_warmreset_cntr/reset_cntr_reg_(\d+)_}</pre>
-skip_fail	Skips the fail error, when the object does not have such an attribute, or the object/attribute itself cannot be recognized.
<i>start</i>	The starting objects or root attributes. Can be an object list, collection, root (<code>/</code>), or root attribute. Example: • The following command returns the root attribute <code>insts</code> that is an object list of all <code>insts</code> in <code>current_design</code>. <pre>>get_db insts</pre> • The following command starts from a dual-ported object list or collection of objects in the Tcl variable <code>\$my_list</code>, and returns a dual-ported object list. <pre>>get_db \$my_list</pre> • The following command returns a root attribute that is a simple value. <pre>>get_db timing_cap_unit</pre> • If the name has a <code>*</code> or <code>?</code>, it will be expanded to all matching root attribute names, and the display will show the attribute names and current value. This is intended for interactive usage, and no values are returned to Tcl. For example, <pre>>get_db timing* Object: root:/ timing_allow_input_delay_on_clock_source: false timing_analysis_aocv: false ...</pre>
-unique	Removes duplicate entries from the return list. If the specified attribute is a list, this parameter returns a unique set of lists., and does not uniquifies the elements within the list. In such a case, use <code>lsort</code> .

Built-In Sub-attributes

The types `rect`, `line`, `point`, and `polygon` have built-in sub-attributes. For a full list of all built-in sub-attributes, see [Common UI Database Object Information](#).

Example:

The `rect` type has built-in sub-attributes like:

area	Area of rect
dx	Delta x
dy	Delta y
ll	Lower-left point
ur	Upper-right point
width	Shorter of dx and dy
length	Longer of dx and dy
perimeter	Length of the rect perimeter

A `point` has sub-attributes like:

x	X coordinate
y	Y coordinate

Like other attributes you can chain them together.

For example, an `inst` object has a `.bbox` (bounding box) that is type “`rect`”. Here are some operations allowed on the `.bbox` attribute of an `inst`.

```
get_db $my_inst .bbox
{1.0 2.0 3.0 4.0}
get_db $my_inst .bbox.ll
{1.0 2.0}
get_db $my_inst .bbox.area
4.0
get_db $my_inst .bbox.ll.x
1.0
set box [get_db $my_inst .bbox]
{1.0 2.0 3.0 4.0}
get_db $box .ll
{1.0 2.0}
```

Examples

- The following command finds insts with names starting with PTN* that have at least one pin capacitance > 0.1. The pattern is checked first, and those that pass will be tested with the `-if` expression. Inside the `-if` expression, there are many `.pins` for one inst, so each pin is tested. If any of the pins have a capacitance > 0.1, the single inst will be matched.

```
get_db insts PTN2* -if {.pins.capacitance_max_rise > 0.1}
```

- The following command returns insts that are not physical-only cells whose name matches `i1/i2*`.

```
get_db insts i1/i2* -if {!.is_physical}
```

- The two commands below generate the same list of pins from `$my_insts` that have a `base_name` `clk`. The first uses a `*` pattern to match all pins, while the second has no pattern and defaults to all pins, so both cases check the `-if` expression for all pins of `$my_insts`.

```
get_db $my_insts .pins * -if {.base_name == clk}
```

```
get_db $my_insts .pins -if {.base_name == clk}
```

- The following command finds `buf1` cell instances connected to nets named `clk` and changes their placement status to `fixed`.

Note: The examples below is inefficient and used to illustrate different methods of traversal done in different styles. A more efficient method would be to start from the nets and looking at their pin connections directly.

Example 1:

```
set cell_name buf1
set net_name clk
foreach inst_obj [get_db insts] {
    set cell_obj [get_db $inst_obj .base_cell]
    if { [get_db $cell_obj .name] == $cell_name } {
        foreach pin_obj [get_db $inst_obj .pins] {
            if { [get_db $pin_obj .net.name] == $net_name } {
                set_db $inst_obj .place_status fixed
            }
        }
    }
}
```

Example 2: Same output using full traversal style with intermediate variables. The second `-if` returns true if any of the `.pins.net.name` match `$net_name` (implicit OR).

```
set buf1_list [get_db insts -if {.base_cell.name == $cell_name}]
set buf1_clk1_list [get_db $buf1_list -if {.pins.net.name == $net_name}]
set_db $buf1_clk1_list .place_status fixed
```

Example 3: Same output using full traversal style (fully chained)

```
set_db [get_db insts -if {.base_cell.name == $cell_name && .pins.net.name == $net_name}]  
.place_status fixed
```

Example 4: Or use the `-foreach` method so no list is returned, but the number of buffers processed is returned.

```
get_db insts -if {.base_cell.name == $cell_name && .pins.net.name == $net_name} -foreach  
{set_db $obj(.) .place_status fixed}
```

- The following command finds all the insts named `i1/i2` that end with `_buf`:

```
get_db insts i1/i2/*_buf
```

Or you could start inside the `hinst` named `i1/i2`:

```
get_db [get_db hinsts i1/i2] .insts *_buf
```

Or use the `hinst` dual-ported object name directly. Note that netlist dual-ported object names have the design name included, so if `top` is the design name you could do this:

```
get_db hinst:top/i1/i2 .insts *_buf
```

- The following command gets `arrival_max_rise` for the `analysis_view` `setup_test` for all pins. Here the abbreviation "view" is allowed for `analysis_view`.

```
get_db pins .arrival_max_rise -index "view setup_test"
```

- The following command finds insts that have a `cell_port` named `CK` and that pin is connected to a net named `clk*`:

```
get_db insts -if {.lib_cells.lib_pins.name == */CK && .pins.net.name == clk*}
```

- The following command uses `-foreach` to find the first inst named `u1/*` with `.place_status` "fixed" and then break. It uses `strict Tcl` inside the `-foreach`.

```
get_db insts u1/* -foreach { if {[string match fixed $obj(.place_status)]} {  
puts $obj(.name) ; break } }
```

- The following `get_db` command uses `-foreach` to count the number of each `base_cell` used in the netlist inside the `cell_count` Tcl array. You can then use `array get cell_count` to see a list of all the `base_cell` names and how many times they are used in the netlist.

```
get_db insts .base_cell -foreach {incr cell_count($obj(.name))}
```

- The following `get_db` command displays all the details of the `flow_template_type` attribute of the root `obj_type`:

```
get_db attribute:root/flow_template_type .*
```

```
Object: attribute:root/flow_template_type
```

```
base_name: flow_template_type
```

```
category: flow
```

```
check_function: {}
```

```
compute_function: {}
```

```
data_type: string
```

```
default_value: {}
```

```
help: {Type of template being run.}
indices:
is_computed: false
is_obsolete: false
is_settable: true
is_user_defined: true
name: root/flow_template_type
obj_type: obj_type:root
set_function: {}
skip_in_db: false
```

- The following example depicts the use of the `-if` parameter to find all HVT insts:

```
get_db insts -if {.base_cell.name == *_HVT}
```

- The following command returns all hinsts 1 or 2 levels inside the design:

```
get_db design:top -depth {1 2}
hinst:top/h1 hinst:top/h1/h2
```

- The following command finds all `local_insts` of each `hinst` at depth 2 that have `.dont_touch == true`:

```
get_db design:top .local_insts -depth {2 2} -if { .dont_touch == true }
inst:top/h1/h2/i1 inst:top/h1/h2/i2
```

- All the following commands return inst with `.name i1/i2`:

```
set a i1/i2
get_db insts i1/i2
get_db insts -expr {$obj(.name) eq $a}
get_db insts -expr {[get_db $obj(.) .name] eq "i1/i2"}
```

- The following command returns all nets with more than 5 loads:

```
get_db nets -expr { [llength $obj(.loads)] > 5 }
```

- The following command returns all insts with `base_cell.name AND2`:

```
get_db insts -expr {$obj(.base_cell.name) eq "AND2"}
```

get_db Category Attributes

The root attributes in the `get_db` category are:

- `get_db_display_limit`

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `get_db` category, use the following command:

```
get_db -category get_db
```

get_db_display_limit

```
get_db_display_limit {integer}
```

Default: 10

Controls the length of lists and number of objects displayed on the screen using queries that contain wildcards.

Note: This variable does not change the return value of `get_db` command. To control the number of characters in the return value of `get_db` use `tcl_return_display_length_limit`.

Example

The following example sets the number of objects and length of the lists to 1 and then calls `get_db` to display instance attributes. `get_db` command outputs one instance object and every attribute list is truncated to one element.

```
set_db get_db_display_limit 1
get_db insts .*
```

```
Object: inst:TOP/I0
```

```
arcs: NC
```

```
area: 0.7056
```

```
base_cell: base_cell:BUFFD0BWP
```

```
bbox: {0.0 0.0 0.0 0.0}
```

```
.....
```

```
pg_base_pins: base_pin:BUFFD0BWP/VDD ... (total length 2) #truncated as length of
the list is set to 1
```

```
pg_pin_nets: net:TOP/VDD ... (total length 2) #truncated as length of the list is
```

```
set to 1
pins:                pin:I0/Z ... (total length 2) #truncated as length of the list is set
to 1
...
route_halo_top_layer: {}
test_reset_inst:      1
```

Note: Number of objects exceeds limit. Use `set_db get_db_display_limit <value>` to control the number of objects evaluated by `get_db <object> .* query`.

get_edge

```
get_edge
[-help]
[-clockwise | -counterclockwise]
[{shape_list} [-direction direction] [-db_units]]
[-index index_number]
```

Returns edges of a polygon of a shape along with the direction list (N, S, E, W and NE, NW, SE, SW). This helps you identify not only all the edges but also the direction in which the edges are pointing. At a time you can observe one polygon with 'n' number of points.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>dbedge</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man get_edge</pre>
<code>-clockwise</code>	Sorts the returned list of edges clockwise.
<code>-counterclockwise</code>	Sorts the returned list of edges counterclockwise.
<code>-db_units</code>	Returns the specified values in database units. Default is <code>microns</code> .
<code>-direction direction</code>	Specifies the types of edges needed. This can be <code>n</code>, <code>s</code>, <code>e</code>, <code>w</code>, <code>ne</code>, <code>nw</code>, <code>se</code>, <code>sw</code>. It can also be a list. For example: <pre>get_edge -direction {n s nw ne} {10 20 30 40}</pre>
<code>-index index_number</code>	Specifies the index number of the edge to be returned. The index number starts with <code>0</code> as the first edge specified in the shape list, and increases gradually along with the shape list. This number may range from <code>0</code> to <code>'number_of_edges - 1'</code>.
<code>{shape_list}</code>	Can be a rect like <code>{llx lly urx ury}</code> or a polygon like <code>{{x1 y1}{x2 y2}{x3 y3}....}</code>. Only one rect or polygon is accepted. Examples Using a simple L-shape polygon <pre>set shape_list {{0 0} {2 0} {2 1} {1 1} {1 2} {0 2}}</pre> • All edges <pre>get_edge \$shape_list {{S{0 0}{2 0}} {E{2 0}{2 1}} {N{2 1}{1 1}} {E{1 1}{1 2}} {N{1 2}{0 2}} {W{0 2}{0 0}}}</pre> • Only E facing edges <pre>get_edge -direction E \$shape_list {{E{2 0} {2 1}} {E{1 1} {1 2}}}</pre> The format of the output is <pre>{{<direction> <edge_vertex_1> <edge_vertex_2> }....}</pre>

Related Commands

- `get_obj_in_area`
- `get_rect`

get_obj_in_area

```
get_obj_in_area
[-help]
[-areas {{llx1 lly1 urx1 ury1} {llx2 lly2 urx2 ury2} ...}]
[-bbox_overlap]
[-dbu]
[-layers {layer1 layer2 ...} [-strict_via_inst_layer_check]]
[-obj_type {bump bus_guide inst inst_all_shapes pin port marker net place_blockage patch_wire
pg_pin route_blockage routes resize_blockage row special special_via special_wire via wire
what_if_wire what_if_via port_shape partition}]
[-abut_only] | [-enclosed_only] | [-overlap_only]
[-polygons {x1 y1 x2 y2 x3 y3 ...}]
[-threads]
```

Returns a list of objects based on an area query without needing to select them. This command supports all types of routing blockages such as partial, fill, and slot.

Parameters

-help	Prints a brief description that includes type and default information for each <code>get_obj_in_area</code> . For a detailed description of the command and all of its parameters, use the man command: <code>man get_obj_in_area</code>
-abut_only	Returns only those objects that abut the search area. No part of the object polygon overlaps the search area. At least one point or line of intersection occurs between the object polygon and the search area. An abutment (such as a corner or crossing edges) is also considered as abutted. When multiple objects are returned as long as it abuts one of the search areas.
-areas {llx lly urx ury}	
	Specifies the search areas for enclosed and/or intersecting objects. The following are the parameters: <code>llx lly urx ury</code> mentioned above: • <code>ll</code> = lower left • <code>ur</code> = upper right
-bbox_overlap	
	Uses the bounding-box of the object rather than the polygon shape of the object for overlap.
-dbu	Specifies if points are in dbUnit. This is optional. <i>Default:</i> um

<code>-enclosed_only</code>	Returns only those objects, which are completely enclosed inside the search area. The object must be completely enclosed by the search area. No part of the object polygon sticks outside the search area, search area edges. When multiple areas are specified, the object will be returned as long as it is completely enclosed by the search areas.
<code>-layers {layer1 layer2 ...}</code>	Returns all the objects with the layer information for the specified layers. This parameter accepts a list of layer names. Types: port_shape, patch_wire, route_blockage, regular, special, special_via, special_wire, and what_if_via. A via, special_via, or what_if_via object will be returned if any of the via or top layer matches with one of the specified layers. Other object types ignore this parameter and are not returned.
<code>-obj_type objTypeList</code>	

Specifies a list of object types to search for overlaps in the area. Multiple object types can be specified at one time. The objects currently supported include: bump bus_guide inst inst_all_shapes pin net place_blockage patch_wire pg_pin route_blockage routes resize_blockage row special_wire via wire what_if_wire what_if_via partition

Here:

- routes is the union of wire, patch_wire, and via.
- special is the union of special_via and special_wire.

Objects with multiple shapes or non-rectangular shapes use a polygon to check for overlaps.

- bump has no placement overlap area, so it uses the polygon of all the OBS and PIN shapes.
- inst uses the polygon of its placement overlap checks (for example the LEF SIZE or OVPOLY) but not any routing halo. OBS shapes or PIN shapes (power-pins) that stick outside the placement overlap area are not included.
- inst_all_shapes is the same as inst, except that it includes all OBS shapes and PIN shapes that stick outside the placement overlap area.
- pin uses the polygon of all the pin-shapes of the pin.
- pg_pin uses the polygon of all the pin-shapes of the pg_pin.
- port_shape uses the polygon of all the shapes of the top-level port_shape.
- net uses the polygon of all the regular routing shapes on the net. Pin-shapes or special shapes on the net are not included.
- port uses the polygon of all the pin-shapes of the top-level port.
- port_shape uses the polygon of all the pin-shapes of the top-level port shape.
- via uses the polygon of all the shapes of the via.
- special_via uses the polygon of all the shapes of the via.
- partition uses the polygon of all the shapes of the partition.

Default: inst

-overlap_only

Returns only those objects, which are partially overlapped with the search area. Some parts overlap the search area, whereas some of its part is outside the search area. A single point is considered as an overlap. When multiple areas are specified, the object is returned as long as it overlaps any of the search areas.

-polygons {x1 y1 x2 y2 x3 y3 ...}

	Specifies the polygon search areas. All the objects overlapping or abutting in the specified
<code>-strict_via_inst_layer_check</code>	
	Returns only those objects on the specified layer, which match with one of the via's bottom parameter does not return the objects of the via on the unmatched layers. It works only for
<code>-threads</code>	Queries objects in multiple-threads mode. Use this parameter only when multiple areas are time is costed. ⚠ This parameter doesn't work in multiple-threads mode while querying special objects and <code>special_wire</code>.

Examples

- The option `-areas` can be used as follows:
 - simple: `-areas`**
Normal use with the area defines a box. Objects that are enclosed or intersect the box are returned.

- point select using: `-areas`**
`-areas {x y x y}`
 Same `x` and `y` for `llx`:
`lly` and `urx:ury`
 Objects that have bounding boxes that cover the point are returned.

- Line select using: `-areas`

`-areas {x1 y x2 y}`

or

`-areas {x y1 x y2}`

Objects that cross the line are returned.

- The following command returns all the instances and routing-blockages on the `metal6` and `metal7` layers that are partially overlapped, abutted, or enclosed in the given triangle area:

```
get_obj_in_area -obj_type {inst route_blockage} -polygons {100 100 110 110 100 110} -  
layers {Metal6 Metal7}
```

- The following command returns all the instances and routing-blockages on the `metal6` and `metal7` layers that are partially overlapped, abutted, or enclosed in the given triangle area using the bounding-box of the objects:

```
get_obj_in_area -obj_type {inst route_blockage} -polygons {100 100 110 110 100 110} -
layers {Metal6 Metal7} -bbox_overlap
```

- The following command returns all the instances and regular wires on the `metal6` and `metal7` layers that are abutted in the give search areas:

```
get_obj_in_area -obj_type {inst wire} -areas {{0 0 100 100} {150 100 200 200}} -layers
{Metal6 Metal7} -abut_only
```

- The following command returns all the instances and regular wires on the `metal6` and `metal7` layers that are abutted in the given search areas using the bounding-box of the objects:

```
get_obj_in_area -obj_type {inst wire} -areas {{0 0 100 100} {150 100 200 200}} -layers
{Metal6 Metal7} -abut_only -bbox_overlap
```

- Following are the figures to illustrate each position relation. The instances presented by the red rectangles are returned with the specified parameter when the search area presented in the blue rectangle are specified.

- `-abut_only`

edge abutment

single point abutment

- `-overlap_only`

overlap only

overlap and abut

- `-enclosed_only`

enclosed only

enclosed and abut

Note:

1. If none of the above three parameters is specified, all the instances presented by the red rectangles will be returned, by default.
2. For querying object with multi-shape (such as `port_shape`) in multiple search areas, if one of its shapes is enclosed/abutted/overlapped with any one of the specified areas, the object will be returned.

Related Commands

- [get_edge](#)
- [get_rect](#)

get_rect

```
get_rect
[-help]
<rect> {-ll | -ur | -llx | -lly | -urx | -ury | -dx | -dy | -width | -length | -center | -
area | -size}
```

Returns the coordinates of the points of a rectangle. When you need to find the coordinates of a rectangle, in order to either move the rectangle or reshape the rectangle, the command helps you find the coordinates.

Parameters

- help	Outputs a brief description that includes type and default information for each <code>get_rect</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man get_rect</code> .
<rect> {-ll -ur -llx -lly -urx -ury -dx -dy -width -length -center - area -size}	
	Specified rectangle to access values from. • <code>-area</code>: Returns the area of the rectangle. • <code>-center</code>: Returns the center of the rectangle. • <code>-length</code>: Returns the larger of the <code>-dx</code> and <code>-dy</code> values. • <code>-ll</code>: Returns the lower left point of the rectangle. • <code>-llx</code>: Returns the lower left x coordinate of the rectangle. • <code>-lly</code>: Returns the lower left y coordinate of the rectangle. • <code>-dx</code>: Returns the x difference between the larger and smaller x values of the rectangle. • <code>-dy</code>: Returns the y difference between the larger and smaller y values of the rectangle. • <code>-ur</code>: Returns the upper right point of the rectangle. • <code>-urx</code>: Returns the upper right x coordinate of the rectangle. • <code>-ury</code>: Returns the upper right y coordinate of the rectangle. • <code>-size</code>: Returns the size of the rectangle from lower left to upper right. • <code>-width</code>: Returns the smaller of the <code>-dx</code> and <code>-dy</code> values.

Examples

- `-area {8.1 9.2 10.3 11.4}` returns 4.84
- `-center {8.1 9.2 10.3 11.4}` returns 9.2 10.3
- `-length: get_rect -length {8.1 9.2 10.3 11.4}` **returns:** 2.2
- `-ll: get_rect -ll {8.1 9.2 10.3 11.4}` **returns:** 8.1 9.2
- `-llx: get_rect -llx {8.1 9.2 10.3 11.4}` **returns:** 8.1
- `-lly: get_rect -lly {8.1 9.2 10.3 11.4}` **returns:** 9.2
- `-size: get_rect -size {8.1 9.2 10.3 11.4}` **returns:** 2.2 2.2
- `-dx: get_rect -dx {8.1 9.2 10.3 11.9}` **returns:** 2.2
- `-dy: get_rect -dy {8.1 9.2 10.3 11.9}` **returns:** 2.7
- `-ur: get_rect -ur {8.1 9.2 10.3 11.4}` **returns:** 10.3 11.4
- `-urx: get_rect -urx {8.1 9.2 10.3 11.4}` **returns:** 10.3
- `-ury: get_rect -ury {8.1 9.2 10.3 11.4}` **returns:** 11.4
- `-width: get_rect -width {8.1 9.2 10.3 11.4}` **returns:** 2.2

Related Commands

- `get_edge`
- `get_obj_in_area`

get_selectively_expanded_modules

get_selectively_expanded_modules
[-help]

Displays the values set by the [set_selectively_expanded_modules](#) command for abstracting cloned instances of modules with a high number of instantiations, and flattening one or more of them.

Parameters

-help	Prints a brief description that includes the type and default information for each <code>get_selectively_expanded_modules</code> parameter. For a detailed description of the command and all its parameters, use the man command: <pre>man get_selectively_expanded_modules</pre>
-------	--

Related Topics

[set_selectively_expanded_modules](#)

get_transform_shapes

```
get_transform_shapes
[-help]
[-db_units]{-inst instPtr | -hier_inst instPtr | {-cell cellPtr -orient orientEnum -pt {x
y}}}}
{-local_pt list | -global_pt list}
```

Takes coordinates local to a cell and returns them in context with the global design space. You can specify a specific instance of a cell in the design, or you can specify a library cell, its location in the design, and instruct the software to perform a "what-if" translation of coordinates within that cell.

Parameters

-help	Pints a brief description that includes type and default information for each <code>get_transform_shapes</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man get_transform_shapes</pre>
-cell <i>cellPtr</i>	Specifies a pointer to a library cell. You must specify the <code>-pt</code> and <code>-orient</code> parameters with <code>-cell</code>.
-db_units	Specifies values in database units, specified in integers. This is an optional parameter. If you use the <code>-db_units</code> option, the Boolean value is 1, so the value will be displayed in database units. If you don't specify the <code>-db_units</code> option, the Boolean value is 0, the default. <i>Default:</i> Specifies values in user units, in microns
-global_pt <i>globalPts</i>	Specifies the global coordinates to convert into local coordinates.
-hier_inst	Specifies the hierarchical instance of a database object. This option is mandatory.
-inst <i>instPtr</i>	Specifies a pointer to a specific instance/bump of a cell in the design. The software derives the coordinates and the orientation for the cell instance from the design.
-local_pt <i>list</i>	Specifies the local coordinates to convert into global coordinates
-orient <i>orientEnum</i>	Specifies the orientation of the cell specified with <code>-cell</code>. You must specify the <code>-cell</code> and <code>-pt</code> parameters with <code>-orient</code>. Valid orientation values are: <code>r0</code>, <code>r90</code>, <code>r180</code>, <code>r270</code>, <code>mx</code>, <code>mx90</code>, <code>my</code>, and <code>my90</code>.
-pt x y	Specifies the coordinates for the cell specified with <code>-cell</code>. You must specify the <code>-cell</code> and <code>-orient</code> parameters with <code>-pt</code>.

Examples

- Assume that a shape exists on *M1* within a NAND2 cell, from (1 1) to (2 2). If an instance of the NAND2 cell is placed at (10 10), with an r0 (N) orientation, the following command converts the local points (1 1 2 2) of the NAND2 cell into their global coordinates:

```
get_transform_shapes -cell [dbGet -p head.allCells.name NAND2] -pt {10 10} -orient r0 -  
local_pt {1 1 2 2}
```

The software returns the following information:

```
{11 11 12 12}
```

- Assume that the NAND2 cell placed at (10 10), with an r0 (N) orientation is named i1. The following command converts the local points (1 1 2 2) of i1 into their equivalent global coordinates:

```
get_transform_shapes -inst [dbGet -p top.insts.name i1] -local_pt {1 1 2 2}
```

The software returns the following information:

```
{11 11 12 12}
```

get_via_pillars

```
get_via_pillars
[-help]
{-base_pin {base_pin | pg_base_pin} | -pin {pin | pg_pin}}
[-required]
```

The command returns a via pillar list on a cell pin.

Parameters

-help	Prints a brief description that includes the type and default information for each <code>get_via_pillars</code> parameter. For a detailed description of the command and all its parameters, use the <code>man</code> command: <code>man get_via_pillars</code>
-base_pin {base_pin pg_base_pin}	Specifies the base pin name or pointer.
-pin {pin pg_pin}	Specifies the pin name or pointer.
-required	Returns the required flag.

Related Information

```
set_via_pillars
```

init_hier_cell

```
init_hier_cell
[-help]
cell_names
[-dual_view]
```

Initializes one or more hierarchical cells based on the applicable order.

Parameters

-help	Prints a brief description that includes the type and default information for each <code>init_hier_cell</code> parameter. For a detailed description of the command and all its parameters, use the <code>man</code> command: <code>man init_hier_cell</code>
cell_names	Specifies the names of the hierarchical cells to be initialized.
-dual_view	Binds the top and global views, and initializes the hierarchical cells inside ILMs.

is_attribute

```
is_attribute
[-help]
attribute_name
-obj_type obj_type
```

The `is_attribute` command checks whether attribute exists or not.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>is_attribute</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man is_attribute.</code>
<code>attribute_name</code>	Specifies the name of the attribute to be checked.
<code>-obj_type obj_type</code>	Specifies the object type of the attribute. All valid object types can be found by typing <code>get_db object_types .name</code> at the prompt. The attribute is assigned to the specified type.

Examples

- The following `is_attribute` command applies check to existing attribute:

```
define_attribute test_delete -obj_type inst -data_type int -category test -help_string
"test delete function" -default 1
is_attribute -obj_type inst test_delete
1
```
- The following `is_attribute` command applies check to non-existent attribute:

```
is_attribute -obj_type pins test_delete
0
```

Related Topics

- For a list of objects attributes that can be queried for information or changed, see the [Common UI Database Object Information](#) document.

report_floating_nets

```
report_floating_nets
[-help]
[-out_file file_name]
```

Reports the number of nets with zero terms, including the PG nets. This command can also be used to report the number of dangling nets, which could or could not be removed by the `delete_floating_nets` command. The command reports the following information, when used:

- Total number of nets
- Number of dangling nets
- Number of removable dangling nets
- Number of non-removable dangling nets

The removable and non-removable nets are reported based on the usage of the `delete_floating_nets` command. Those dangling nets, which could not be removed by the `delete_floating_nets` command, are reported in the output file due to multiple possible reasons, such as the dangling net:

- Is a physical net.
- Is a PG net.
- Is a bus bit net.
- Is an assign net.
- Has multiple module ports and at least one port is associated with some constraints.
- Has some constraints, such as in an ILM module or some timing constraint.

Note: If a dangling net cannot be deleted due to any reason, only the first reason listed above will be reported in the output file.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>report_floating_nets</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man report_floating_nets</pre>
<code>-out_file</code> <code><i>file_name</i></code>	Reports the list of dangling nets that cannot be deleted by the <code>delete_floating_nets</code> command, along with its reasons.

Examples

- The following command reports the information about the nets listed in the `dangling_net.rpt` file:

```
report_floating_nets -out_file dangling_net.rpt
```

- Following is the output of the above command:

```
#####  
# Generated by: Cadence Tempus 19.10-p002_1  
# OS: Linux x86_64(Host ID sjfsb473)  
# Generated on: Sat Aug 18 11:14:18 2018  
# Design: design_name  
# Command: report_floating_nets -out_file dangling_nets.rpt  
#####  
  
Total number of nets: 123456  
The number of dangling nets: 26  
Removable dangling nets: 22  
Non-removable dangling nets: 4  
Is physical net: 2  
Is P/G net: 0  
Is bus net: 1  
Is assign net: 0  
Has module port:0  
Has constraints: 1  
  
Reasons for the net not being removed:  
net:xxxx is physical net ## net:xxxx here is the DPO name of the net  
net:xxxx is physical net  
net:xxxx is bus net  
net:xxxx has constraints
```

Related Commands

`delete_floating_nets`

report_metal_stack

```
report_metal_stack
[-help]
[-non_preferred_direction]
```

Reports the metal stack configuration and routing track information. For each routing layer, this includes the layer name, preferred routing direction, routing offset (offset of routing track from 0), routing pitch (space between each routing track), min-width DRC rule, min-spacing DRC rule, and the routing default-width (wire width of the default routing rule). Note that for a horizontal direction track, the offset and pitch are in the Y direction (for example, the Y offset from 0, and the Y pitch of horizontal tracks). This command only supports uniform track-patterns with a single pitch value, and will not report non-uniform pitch routing track patterns that can be created with `add_tracks` or `create_tracks`.

Parameters

-help	Outputs a brief description that includes the type and default information for each <code>report_metal_stack</code> parameters. For a detailed description of the command and all its parameters, use: <code>man report_metal_stack</code>
-non_preferred_direction	By default, the <code>report_metal_stack</code> command displays the metal stack and routing information only related to the preferred routing direction. When the <code>-non_preferred_direction</code> parameter is used, the information related to the non-preferred routing direction is also displayed. <i>Data_type</i> : bool, optional

Examples

- The following command displays the metal stack and routing information:

```
report_metal_stack
```

The following is an example of the output of the above command:

```
=====
Layer    Direction  Offset    Pitch      Min_Spacing  Min_Width  Default_Width
=====
M1       horizontal 0.000000  0.040000   0.020000    0.020000   0.020000
M2       vertical   0.000000  0.057000   0.020000    0.037000   0.037000
M3       horizontal 0.000000  0.040000   0.020000    0.020000   0.020000
M4       vertical   0.000000  0.048000   0.020000    0.028000   0.028000
```

- The following command adds in the non-preferred routing direction information:

```
report_metal_stack -non_preferred_direction
```

The following is the output of the above command:

```
=====
=
Layer    Direction  Preferred Offset    Pitch      Min_Spacing  Min_Width  Default_Width
=====
=
M1       horizontal yes        0.000000  0.040000   0.020000    0.020000   0.020000
M1       vertical   no         0.000000  0.040000   0.000000    0.000000   0.060000
M2       vertical   yes        0.000000  0.057000   0.020000    0.037000   0.037000
M2       horizontal no         0.000000  0.057000   0.000000    0.000000   0.060000
M3       horizontal yes        0.000000  0.040000   0.020000    0.020000   0.020000
M3       vertical   no         0.000000  0.040000   0.000000    0.000000   0.060000
M4       vertical   yes        0.000000  0.048000   0.020000    0.028000   0.028000
M4       horizontal no         0.000000  0.048000   0.000000    0.000000   0.060000
```

report_net_wires

```
report_net_wires  
[-help]  
[-file fileName]  
[-net netName]
```

Displays information about the regular net wires. If the `-net` parameter of this command is not specified, the wires of all the nets are displayed. If the `-file` parameter of this command is not specified,, the wire information on the screen (console) and log file are displayed. The information about the net regular wires is categorized as:

- Node Information
- Edge Information

Node Information

It includes XY location (like `Loc=(2.3, 52.11)`), metal layer (like `Layer=M1(2)`), number of edges on the current node (like `Edges=2`), tie special node name (like `Tie Special`), and global route node name (like `Global Route`). If the node has a terminal attached, the node information also includes the term information, like `Term = a/b/c, IO Pin = name, or PG Term = x/y/z`.

Edge Information

It includes node number (like `Node3 -> Node5`), edge type (like `Type=HV Wire`), and edge status (like `Status=Routed`). The edge status list includes `None, Routed, Fixed, Cover, Shield, No Shield, Global, Assigned`. For different edge types, the edge information reports different edge attributes. Following is the list of various edge types and their attributes:

- HV Wire:
 - NDR=name (non-default rule name)
 - Width=3.3 (wire width)
 - Begin Extension=3.3 (wire beginning extension)
 - End Extension=3.3 (wire ending extension)
 - Mask=1 (color/mask value)
- Via:
 - Via Cell=name (via cell name)
 - NDR=name (non-default rule name)
 - Top Mask=1 (top metal layer's color/mask value)
 - Cut Mask=1 (cut layer's color/mask value)
 - Bottom Mask=1 (bottom metal layer's color/mask value)
- Patch:
 - Box=(100.0,200.0,223.6,250.4) (patch box coordinates)
 - Mask=1 (patch color/mask value)

Attr=304 (patch attributes value)

If it is a non-routing patch, it will also report trim metal information as shown below:

Trim Metal Box=(10.0, 10.0, 11.9, 11.9) (trim metal box coordinates)

Mask=1 (trim metal color/mask value)

Layer=name (trim metal layer name)

- 45 Degree:

NDR=name (non-default rule name)

Width=3.3 (wire width)

Mask=1 (color/mask value)

- Zero Length

- Term Connect

- Virtual:

Zero Length, Term Connect, and Virtual have no extra attribute information. Following is an example of a single net:

Wires for the net1 net:

Node0: Loc=(44.102, 55.203), Layer=PO(2), Edges=1, Global Route

Term = inst1/b

Node1: Loc=(44.102, 66.304), Layer=Po(2), Edges=1

IO Pin = net1

Edge0: (Node0->Node1), Type=HV Wire, Status=Routed, NDR=ndr1, Width=0.056, Begin

Extension=0.056, End Extension=0.056, Mask=1

Parameters

-help	Prints a brief description that includes the type and default information for each <code>report_net_wires</code> parameter. For a detailed description of the command and all its parameters, use the man command: <code>man report_net_wires</code>
-file <i>fileName</i>	Specifies the name of the file.
-net <i>netName</i>	Specifies the name of the net.

report_via_def

```
report_via_def
[-help]
[-detail]
[-on_clock_nets]
[-on_selected_nets]
[-regular]
[-special]
```

Reports single and multi-cut via summary for special and/or regular vias. Such a summary could be used for generating automotive statistics regarding the usage of single and multi-cut used vias.

Parameters

-help	Prints a brief description that includes the type and default information for each <code>report_via_def</code> parameter. For a detailed description of the command and all its parameters, use the <code>man</code> command: <code>man report_via_def</code>
-detail	Prints the detailed report related to every via def.
-on_clock_nets	If specified, the command reports vias only on the clock nets in the design. If not specified, the command reports vias on all nets in the design by default. This parameter can be used with the <code>-detail</code> , <code>-special</code> , and <code>-regular</code> parameters.
-on_selected_nets	If specified, the command reports vias only on the specified selected nets. If not specified, the command reports vias on all nets in the design by default. This parameter can be used with the <code>-detail</code> , <code>-special</code> , and <code>-regular</code> parameters.
-regular	Prints the report related to regular routing vias.
-special	Prints the report related to special routing vias.

Examples

Use the following command to display a detailed summary of the single and multi-cut vias:

```
report_via_def -detail
```

Following is the sample output of the above command:

```
#-----
```

reset_db

```
reset_db
[-help]
[start[chain]] |
[-category category_name]
[-quiet]
[-verbose]
```

Resets the attribute value to a pre-defined default value. It returns a single value when resetting a single attribute, a list of values when resetting the same attribute on different object instances, or a human-readable table for multiple attributes in the following format:

```
Attribute_name    value
```

For example:

```
Place_xxx true
Add_filler  true
```

- The `-category` parameter of the `reset_db` command can be used to reset root attributes only. Both user-defined and system root attributes can be reset using the `-category` parameter.
- The attribute value can be reset if the `default_value` attribute is specified.

When the `-category` parameter is used, the command resets the values of both the hidden and unmapped attributes. In such a case, the command does not return the count of the reset attributes. The output in such cases will be like the following:

```
Some hidden attributes were also reset.
```

Note: The `reset_db` command is not supported in DSTA.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>reset_db</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man reset_db</code>.
<code>start</code>	Can be any object list (or collection) or <i>shorthand</i>. For example <code>nets</code>, <code>insts</code>...
<code>chain</code>	Specifies the <i>chain</i> in the form <code>[.attribute_name1 [.attribute_name2] ...]</code>. The specified attribute names are valid for each level of the traversal in the <i>chain</i>.
<code>-category category_name</code>	Specified root attribute category based on predefined list of categories. For example <code>timing</code>. Note: Applies only to root level attributes and ignored if applied to lower levels.
<code>-quiet</code>	By default <code>set_db</code> is quiet. If the <code>set_db_verbose</code> root attribute is set to true, then the name of each object that is modified is echoed to the terminal (see the <code>-verbose</code> parameter's description for an example). <code>-quiet</code> forces <code>set_db</code> to be quiet even if <code>set_db_verbose</code> is true. This is intended for internal scripts that want to be certain that the verbose output is off.
<code>-verbose</code>	Turns on verbose output that echoes the name of each object that is modified. This can be useful during interactive debugging to ensure that the correct objects were affected. For example: <pre>set_db -verbose [get_db hinsts D*] .dont_touch false Setting attribute of hinst 'DATA_BUS_MACH_INST': 'dont_touch' = false Setting attribute of hinst 'DECODE_INST': 'dont_touch' = false 2 false</pre> Note: The <code>set_db_verbose</code> root attribute can also be set to true, to force verbose output for all <code>set_db</code> and <code>reset_db</code> usage without requiring <code>-verbose</code>.

Examples

- The following `reset_db` command resets the value of instance attribute:

```
define_attribute test_reset_inst -obj_type inst -data_type int -category reset -  
help_string "test reset function" -default 1  
1  
set_db insts .test_reset_inst 10  
10 10 10 10 10          #Four instances in the design  
reset_db insts .test_reset_inst  
1 1 1 1 1              #All 4 attributes are reset to default values
```

- The following command resets same set of attributes using the `-category` parameter.

```
reset_db -category reset
```

The attributes are reset to their default values and a human readable table with new values is displayed.

```
test_reset1 1  
test_reset2 1  
test_reset3 1
```

Related Topics

- For information on how to query DB attributes, see the [get_db](#) command.
- For information on how to set DB attributes, see the [set_db](#) command.
- For a list of objects attributes that can be queried for information or changed, see the [Common UI Database Object Information](#) document.
- [set_db Category Attributes](#)

set_db

```
set_db
[-help]
start
[chain]
value
[-dbu]
[-index {index_type1 name1 [index_type2 name2 ...]}]
[-quiet]
[-verbose]
```

Changes the specified attribute value for a database object. The `set_db` command takes a dual-ported object, dual-ported object list, or a collection as input, and then uses a period (.) to traverse to other related objects or to access attributes. You can use additional periods to traverse the data base schema.

This command returns the number of attributes set and the value. See the example below:

```
set_db hinsts .ungroup_ok false
6 false
```

In the above scenario usage, `values == value` as a single command can set only a single value (for multiple objects).

Note: A Dual-Ported Object (DPO) is a `Tcl_Obj` in the C++ programming interface. The pointer is kept as a C++ pointer inside Tcl unless Tcl forces it to be evaluated as a string. In normal usage it never gets converted to a string which is more efficient, but if you do a `puts $var` or return the value to the shell, it will be converted to its dual string form.

- The string form is normally a useful name preceded by the `obj_type`, so a `base_cell` object string form might look like `base_cell:and2`.
- A `netlist` name will have the current design name included, so an instance named `i1/i2` in design top, would look like `inst:top/i1/i2`.
- An object with no name like a wire, will just show the pointer hex-value like `wire:0x22222`.

The `set_db` command does not create or delete objects.

For information on what object attributes are settable, see the [Common UI Database Object Information](#) document. It contains a description of all database objects and attributes.

The root object has the current design data under the `current_design` attribute, while technology and library data are normally directly accessible as root attributes (For example, layers and libraries). The root object is the default starting point if there is no input list or collection given.

You can set any root attribute in any of the following ways:

- `set_db / .flow_mail_to name`
where, `'/'` is the notation for the root object , or,

- `set_db flow_mail_to name`

This implicitly starts at the root.

For example, you can use the following command to change the design text font:

```
set_db current_design .texts.font_number 4
```

Note: The `current_design` is implicitly created by the `init_design` or the `read_db` commands.

Frequently used `current_design` attributes like `insts` or `hinsts` (hierarchical `insts`) have root attribute aliases (or shortcuts). These attributes can be accessed by just typing the root attribute alias name.

For example, the following two commands set all `insts` `place_status` to fixed.

```
set_db current_design .insts.place_status fixed
set_db insts .place_status fixed
```

Some of the more commonly used aliases from the `current_design` attributes include: `insts`, `hinsts`, `nets`, `hnets`, `ports`, `hpins`, `pins`.

The `set_db` command supports auto-complete when you press the <Tab> key. It will give a list of all matching attributes starting with the letters entered so far, or it will complete the name if it is unique.

For example:

```
set_db plan_design_use<Tab>
```

returns `plan_design_use_guide_boundary` `plan_design_use_sdp_group`

For information on how to access DB objects, see the `get_db` command.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>set_db</code> parameter.
<code>start</code>	The starting objects or attributes. Can be an object list, collection, root (/), or root attribute.
<code>chain</code>	Specifies a <i>chain</i> in the form <code>[.attribute1[.attribute2]...]</code> . The attribute names must be valid for each level of the traversal in the <i>chain</i> , where the first name is valid for the start object. For example, <code>set_db \$my_pins .inst.place_status fixed</code> where <code>.inst</code> is an attribute of an pin object and <code>.place_status</code> is an attribute of an inst object.
<code>value</code>	Specifies new value for the specified object attribute elements. The value type depends on which object attribute type is being modified.

-dbu	Indicates that attribute values (coord, pt, rect, polygon, area, ...) should be in database units. <i>Default:</i> The default is microns (or microns**2).
-index { <i>index_type1 name1</i> [<i>index_type2 name2</i> ...]}	
	Some attributes represent an array of values. For example, a pins .slack_max_rise attribute has a different value for each analysis_view. With no index, all the values defined for that attribute are modified by the <code>set_db</code> command. If you want to change a specific value, you must include the index value. The index values are pairs of obj_type names (for example, analysis_view, clock, skew_group) followed by the name. The word “view” is accepted as an abbreviation for “analysis_view”. Example: Some ccopt attributes can take both a view and clock index like this: <pre>-index "view func_wc_cworst clock clk1"</pre>
-quiet	By default <code>set_db</code> is quiet. If the <code>set_db_verbose</code> root attribute is set to true, then the name of each object that is modified is echoed to the terminal (see the <code>-verbose</code> parameter's description for an example). <code>-quiet</code> forces <code>set_db</code> to be quiet even if <code>set_db_verbose</code> is true. This is intended for internal scripts that want to be certain that the verbose output is off.
-verbose	Turns on verbose output that echoes the name of each object that is modified. This can be useful during interactive debugging to ensure that the correct objects were affected. For example: <pre>set_db -verbose [get_db hinsts D*] .dont_touch false Setting attribute of hinst 'DATA_BUS_MACH_INST': 'dont_touch' = false Setting attribute of hinst 'DECODE_INST': 'dont_touch' = false 2 false</pre> Note: The <code>set_db_verbose</code> root attribute can also be set to true, to force verbose output for all <code>set_db</code> and <code>reset_db</code> usage without requiring <code>-verbose</code>.

Examples

- The following command sets a value of root attribute.

```
set_db place_global_solver_effort high
```

- The following commands define an instance attribute and change its value to 0.

```
define_attribute myattr -default 1 -obj_type inst -data_type int -help_string "my
attribute" -category my_cat
set_db insts .myattr 0
```

- The following command sets an instance attribute value to 5 only if its current value is 0.

```
set_db [get_db insts -if {.myattr == 0}] .myattr 5
```

Related Topics

- For information on how to query DB attributes, see the [get_db](#) command.
- For information on how to reset attribute values, see the [reset_db](#) command.

set_db Category Attributes

The root attribute in the `set_db` category is:

- [set_db_verbose](#)

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `get_db` category, use the following command:

```
get_db -category set_db
```

set_db_verbose

```
set_db_verbose {true | false}
```

Default: false

When true, additional messages are displayed describing every object modified by `set_db` or `reset_db` commands.

Refer to the following example:

```
set_db set_db_verbose true
set_db [get_db hinsts */D*] .dont_touch true
Setting attribute of hinst 'DATA_BUS_MACH_INST': 'dont_touch' = true
Setting attribute of hinst 'DECODE_INST': 'dont_touch' = true
```

```
2 true
set_db set_db_verbose false
Setting attribute of root '/': 'set_db_verbose' = false
1 false
set_db [get_db hinsts */D*] .dont_touch true
2 true
```

set_selectively_expanded_modules

set_selectively_expanded_modules
[-help]

While performing Static Timing Analysis (STA) or Engineering Change Orders (ECO), very large designs often contain modules with a high number of instantiations. Creating RTL-level configurations for smaller portions of such designs is often challenging.

The `set_selectively_expanded_modules` command addresses this issue by specifying modules with instantiations that are to be abstracted, or are not timed, based on the specifications set through the `set_expanded_hinsts` command.

This reduces memory usage and runtime significantly during the STA and ECO processes. It helps in handling large designs on smaller machines and facilitates ECO implementation without the need of manually partition the design into smaller segments.

- This command is recommended exclusively for modules with high instantiation counts and is not recommended to use for single-instance modules.
- All STA views must use consistent flattening specifications. For ECO, the same netlist and flattening specifications must be loaded to ensure alignment.

Parameters

-help	Prints a brief description that includes the type and default information for each <code>set_selectively_expanded_modules</code> parameter. For a detailed description of the command and all its parameters, use the man command: <pre>man set_selectively_expanded_modules</pre>
-------	--

Examples

- The following command set presents an example of instantiation of `a` and `c` modules, which are selectively expanded:

```
read_lib my_lib
read_verilog my_verilog    # instantiations of modules "a" and "c" are to be selectively
expanded
set_selectively_expanded_modules "a c"    # expand "u1" and "u1/u2"
```

```
set_expanded_hinsts "u1 u1/u2"; # No order requirement: "u1/u2 u1" is OK, too
set_top_module top
```

Netlist:

```
module top;
  a u1; a u2;
endmodule
module a;
  b u1; c u2; c u3;
endmodule
module b;
  BUFX2 u1;
endmodule
module c;
  BUFX2 u1;
endmodule
```

Following is the expansion result of the above example:

```
COMPONENTS 4 ;
- u1/u1/u1 BUFX2 ;
- u1/u2/u1 BUFX2 ;
- u1/u3 c ;
- u2 a ;END COMPONENTS
```

- The following command set presents an example of instantiation of c module, which is selectively

expanded:

```
read_lib my_lib
read_verilog my_verilog # instantiations of modules "c" are to be selectively expanded
set_selectively_expanded_modules "c" # expand "u1/u2", "u2/u2" and "u2/u3"
set_expanded_hinsts "u1/u2 u2/u2 u2/u3"
set_top_module top
```

Netlist:

```
module top;
  a u1; a u2;
endmodule
module a;
  b u1; c u2; c u3;
endmodule
module b;
  BUFX2 u1;
endmodule
module c;
  BUFX2 u1;
endmodule
```

Following is the expansion result of the above example:

```
COMPONENTS 6 ;
- u1/u1/u1 BUFX2 ;
```

```
- u1/u2/u1 BUFX2 ;  
- u1/u3 c ;  
- u2/u1/u1 BUFX2 ;  
- u2/u2/u1 BUFX2 ;  
- u2/u3/u1 BUFX2 ;
```

END COMPONENTS

- The following command set presents an example of instantiation of `b` and `c` modules, which are selectively expanded:

```
read_lib my_lib  
read_verilog my_verilog # instantiations of modules "b" and "c" are to be selectively  
expanded  
set_selectively_expanded_modules "b c" # expand "u2/u1", "u2/u2" and "u2/u3"  
set_expanded_hinsts "u2/u1 u2/u2 u2/u3"  
set_top_module top
```

Netlist:

```
module top;  
    a u1; a u2;  
endmodule  
module a;  
    b u1; c u2; c u3;  
endmodule  
module b;  
    BUFX2 u1;  
endmodule  
module c;  
    BUFX2 u1;  
endmodule
```

Following is the expansion result of the above example:

```
COMPONENTS 6 ;
- u1/u1 b ;
- u1/u2 c ;
- u1/u3 c ;
- u2/u1/u1 BUFX2 ;
- u2/u2/u1 BUFX2 ;
- u2/u3/u1 BUFX2 ;
END COMPONENTS
```

- The following command set presents an example of instantiation the a module, which is selectively expanded:

```
read_lib my_lib
read_verilog my_verilog # instantiations of modules "a" are to be selectively expanded
set_selectively_expanded_modules "a" # do not expand any instantiation of "a"
set_expanded_hinsts ""; # Note: same result if this line is removed
set_top_module top
```

Netlist:

```
module top;
  a u1; a u2;
endmodule
module a;
```

```

b u1; c u2; c u3;
endmodule
module b;
  BUFX2 u1;
endmodule
module c;
  BUFX2 u1;
endmodule

```

Following is the expansion result of the above example:

```

COMPONENTS 2 ;
- u1 a ;
- u2 a ;
END COMPONENTS

```

[get_selectively_expanded_modules](#)

set_via_pillars

```
set_via_pillars
[-help]
{-base_pin {base_pin | pg_base_pin} | -pin {pin | pg_pin}}
[-required {0 | 1 | 2 | 3 | 4}]
stack_via_rule*
```

This command sets a via pillar list for a cell `base_pin` or a single via pillar for a `pin`.

Parameters

-help	Prints a brief description that includes the type and default information for each <code>set_via_pillars</code> parameter. For a detailed description of the command and all its parameters, use the <code>man</code> command: <code>man set_via_pillars</code>
-base_pin {base_pin pg_base_pin}	Specifies the base pin name or pointer. A via pillar list is allowed for this parameter.
-pin {pin pg_pin}	Specifies the pin name or pointer. Only one via pillar is allowed for this parameter.

```
-required {0 |  
1 | 2 | 3 | 4}
```

Sets the `.stack_via_rule_Required` attribute for the `base_pin/pin` values specified by the `-base_pin` or `-pin` parameters. Setting the `.stack_via_rule_Required` attribute determines whether the stack vias are required for the specified `base_pin`.

- When set to 0 for a `base_pin`, this parameter sets the `.stack_via_rule_Required` attribute to 0, which ignores this `base_pin` for `stack_via_rule` checking. If the parameter is set to 0 only for a `pin`, other `pin` values instantiated from the same `base_pin` will not be affected.
- When set to 1 for a `base_pin`, this parameter sets the `.stack_via_rule_Required` attribute to 1 on the `base_pin` values. When set to 1 for an `pin`, it enforces the via pillar only on the specified `pin`. However, if the via pillar list is empty for an `pin`, no via pillar is used even when the required bit is 1. If set to 1, the software performs min via pillar insertion with dirty mode, in which the via pillars are added even if there is DRC.
- When set to 2 for a `base_pin`, this parameter sets the `.stack_via_rule_Required` attribute to 2 on the `base_pin` values. If set to 2, the software performs min via pillar insertion with clean mode, in which the via pillars are not added if there is DRC.
- When set to 3 for a `base_pin`, this parameter sets the `.stack_via_rule_Required` attribute to 3 on the `base_pin` values. If set to 3, the software performs multiple tries from large to min via pillar insertion with dirty mode, in which the via pillars are added even if there is DRC.
- When set to 4 for a `base_pin`, this parameter sets the `.stack_via_rule_Required` attribute to 4 on the `base_pin` values. If set to 4, the software performs multiple tries from large to min via pillar insertion with clean mode, in which the via pillars are not added if there is DRC.

 The 2, 3, and 4 values of this parameter are applicable only for a `base_pin`.

<i>stack_via_rule*</i>	Provides a list of via pillars for a cell <code>base_pin</code>, or a single via pillar for a <code>pin</code>. This list further provides the candidates of <code>pin</code> via pillar setting. On running: <pre>set_via_pillars -base_pin BUFX1/Z -required 1 {vp_rule1 vp_rule2}</pre> <code>set_via_pillars</code> automatically sets the minimal cost via pillar rule for the corresponding <code>pin</code>, which is <code>vp_rule1</code>. You can also set the other via pillar rule to the <code>pin</code> by running: <pre>set_via_pillars -pin i1/i2/Y vp_rule2</pre> An empty <i>stack_via_rule</i> will remove the via pillar from <code>pin</code>: <pre>set_via_pillars -pin i1/i2/Y -required 1 ""</pre>
------------------------	--

Examples

- Where the cell of `inst i1/i2` and `i1/i3` are both `BUFX1`, the following commands indicate that `pin i1/i2/Z` requires a via pillar `M2M4_1X3`:

```
set_via_pillars -base_pin BUFX1/Z -required 1 {M2M4_1X2 M2M4_1X3}
```

```
set_via_pillars -pin i1/i2/Z -required 1 M2M4_1X3
```

#The via pillar for `pin` must be on the cell `base_pin`'s via pillar list. Otherwise, a proper `ERROR` should be returned.
- The following command removes the via pillar `M2M4_1X3` from `pin i1/i2/Z`:

```
set_via_pillars -pin i1/i2/Z "" -required 1
```
- The following command sets a via pillar list on a cell `pin`:

```
set_via_pillars -base_pin BUFX1/Z -required 1 {M2M4_1X2 M2M4_1X3}
```
- The following command sets a via pillar with via pillar list of the corresponding cell `pin` on a `pin`; the cell of `inst i1/i2` is `BUFX1`:

```
set_via_pillars -pin i1/i2/Z M2M4_1X3
```
- The following command sets via pillar to cell `pin AN2_NOM_D16*/Z`:

```
foreach cell [dbGet head.libCells.name -e AN2_NOM_D16*] {set_via_pillars -base_pin
$cell/Z -required 0 {VPPERF_M2_M4_1_2_1 VPPERF_M2_M5_1_2_2_1
VPPERF_M2_M9_1_2_2_2_2_2_1} }
```

Related Information

[get_via_pillars](#)

sort_db

```
sort_db  
[-help]  
obj_list  
[attribute_list]  
[-descending]  
[-dictionary]
```

Returns a sorted DPO (dual-ported object) list based on the contents of one or more attributes. It is based on `lsort` using `get_db` to access the various attributes.

This command sorts objects only based on the attributes that have a "simple" data type of string, float, or integer, or object. If it is an object, it is implicitly sorted by the `.name` field and treated as a string. By default, the `sort_db` command sorts any input list as string. But when the `-dictionary` parameter is specified, the numeric values are sorted numerically, like `lsort`.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>sort_db</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man sort_db</code>
<code>obj_list</code>	A DPO list to be sorted. If the first element of the specified list is not a DPO, then it is treated as a root attribute name and passed directly to <code>get_db</code> to return a DPO list. So, the following two commands have identical results: <code>sort_db insts</code> <code>sort_db [get_db insts]</code>
<code>attribute_list</code>	Sorts the DPO list by the specified attribute values. The first attribute in the <code>attribute_list</code> has the highest sort precedence. Each attribute can be a chain identical to what <code>get_db</code> supports. A leading "." is optional, so all the following commands presenting the use of <code>attribute_list</code> specify legal arguments for an inst list: <code>sort_db insts name</code> <code>sort_db insts .name</code> <code>sort_db insts {location.x location.y}</code> <code>sort_db insts {.location.x .location.y}</code>
<code>-descending</code>	Sorts the list of objects by the descending order.
<code>-dictionary</code>	Sorts the objects using string comparison in all cases, except when the strings contain numbers. The numbers in strings are compared as integers/real.

Examples

- The following command sorts all the insts by name:
`sort_db insts`
- The following command sorts the pins based on their slack. The pins with the same slack are further sorted by the x-location:
`sort_db [get_db pins] {.slack .location.x}`

Related Topics

- [set_db](#)

tech Category Attributes

The root attributes in the `tech` category are:

- `tech_db_units`
- `tech_finfet_grid_direction`
- `tech_finfet_grid_offset`
- `tech_finfet_grid_pitch`
- `tech_inst_mask_shift_layers`
- `tech_mfg_grid`

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `tech` category, use the following command:

```
get_db -category tech
```

tech_db_units

`tech_db_units int`

Default: ""

Data_type: Instance

Specifies the database units per micron from LEF UNITS statement or OA techfile, unless `init_min_dbu_per_micron` is larger and overrides the LEF/OA value.

tech_finfet_grid_direction

`tech_finfet_grid_direction enum`

Default: vertical

Data_type: Enum

Specifies an enum value indicating the direction of the finfet grid from the LEF FINFET statement or OA.

tech_finfet_grid_offset

`tech_finfet_grid_offset coord`

Default: `no_value`

Data_type: `Coordinate`

Specifies the finfet grid offset from 0 in microns from the LEF FINFET statement or OA.

tech_finfet_grid_pitch

`tech_finfet_grid_pitch coord`

Default: `no_value`

Data_type: `Coordinate`

Specifies the finfet grid pitch in microns from the LEF FINFET statement or OA.

tech_inst_mask_shift_layers

`tech_inst_mask_shift_layers layer*`

Default: `" "`

Data_type: `Layer`

Specifies the ordered list of layer pointers to the layers that allow instance mask shifting. This is the list of layers that show up in the DEF COMPONENTMASK statement for layers that can have mask values shifted in standard cells.

tech_mfg_grid

`tech_mfg_grid coord`

Default: `" "`

Data_type: `Coordinate`

Specifies the manufacturing grid from LEF MANUFACTURINGGRID statement or OA techfile.

Note: This is the default value for each layer, but it can be overridden for specific layers. In some technologies, the `mfg_grid` for higher metal layers is coarser than for the lower layers.

uniquify

uniquify

[-help]

{*[design | module]* | -new_master *hinsts*} [-exclude *modules*]

[-verbose]

Supports regrouping of master-clone partitions inside the non-unique modules. This command uniquifies or regroups the master/clones (one master module used by two or more `hinst` clones) by creating unique modules for each `hinst` clone, as needed. In all the cases, the new module names are generated by appending the '`_number`' suffix (such as `_1` and `_2`) sequentially to the original module name for creating a unique module name.

Parameters

<code>-help</code>	Prints a brief description that includes the type and default information for each <code>uniquify</code> parameter. For a detailed description of the command and all its parameters, use the <code>man</code> command: <pre>man uniquify</pre>
<code>design module</code>	Regroups the master/clones within the <code>design</code> or <code>module</code> and recursively below it. This assures that all the <code>hinsts</code> inside those would have their own unique module, except for the modules specified using the <code>-exclude</code> parameter. In case multiple <code>hinsts</code> are referenced to the specified <code>module</code>, those will remain as clones. <i>Type: Mandatory</i>
<code>-new_master hinsts</code>	Splits the <code>hinst</code> clones of a master module into the clones of a new master. The new master is also regrouped, except for the modules specified using the <code>-exclude</code> parameter. It may also happen that one of such <code>hinst</code> clones is forced to have a new master (refer to the Examples section). In case a <code>hinst</code> is not a clone of the same module, an error message is displayed. <i>Type: Mandatory</i>
<code>-exclude modules</code>	Excludes the specified modules from unification or regrouping. Use this parameter if a specific sub-module is a partition, which will be implemented and shared only once. <i>Type: Optional</i>
<code>-verbose</code>	Reports the <code>hinst</code> clones (if any), which are regrouped. <i>Type: Optional</i>

Examples

- The following command uniquifies the whole design, where the `h1`, `h2`, and `h3` `hinsts` are clones of the `mod1` module, and the `h4` and `h5` `hinsts` (clones of the `mod2` module) are inside `mod1`:

```
uniquify top -verbose
#hinst name module name
h1 mod1 (unchanged)
h2 mod1_1
h3 mod1_2
h1/h4 mod2 (unchanged)
h1/h5 mod2_1
```

```
h2/h4 mod2_2
h2/h5 mod2_3
h3/h4 mod2_4
h3/h5 mod2_5
```

Note that the first clone of each module is not modified. So, `h1` still uses `mod1`, and `h1/h4` still use `mod2`. However, these are still reported to see the `hinst` clone, which forces a new module for the other `hinst` clones.

- Using the same scenario as in the previous example, the following command uniquifies the design below `mod1`:

```
uniquify mod1 -verbose
#hinst name module name
h1/h4 mod2 (unchanged)
h1/h5 mod2_1
h2/h4 mod2 (unchanged)
h2/h5 mod2_1
h3/h4 mod2 (unchanged)
h3/h5 mod2_1
```

Note that only the design inside `mod1` is uniquified. So, `h1`, `h2`, and `h3` are still the clones of `mod1`, and there are still master/clones grouping between `h1`, `h2`, and `h3`. For instance, all the `h4s` use `mod2`, and all the `h5s` use `mod2_1`.

- Using the same scenario as in the first example, the following command splits `h1` and `h2` into a new master. This is normally done, if `h1`, `h2`, and `h3` are partitions and need a different implementation than `h3`. It is recommended not to uniquify `mod2`, if it is a lower-level partition, which will be implemented once and shared by all `h1`, `h2`, and `h3`.

```
uniquify -new_master {h1 h2} -exclude mod2 -verbose
#hinst name module name
h1 mod1_1
h2 mod1_1
```

Note that `h3` is still using `mod1`, and the `mod2` `hinsts` inside `mod1` and `mod1_1` (such as `h4` and `h5`) are still the clones of `mod2`. If there is also a `mod3` inside `mod1`, it will also be uniquified, but nothing inside `mod2` is uniquified.

- Using the same scenario as in the first example, the following command splits `h1` and `h4` into a new master. This implicitly forces `h1` to be uniquified from `h2` and `h3`.

```
uniquify -new_master {h1/h4} -verbose
#hinst name module name
h1 mod1_1 (forced by lower level change)
h1/h4 mod2_1
```

If there is a `mod4` inside `mod2_1`, it will also be uniquified, but it will not be shared with `mod2`.

write_preserves

```
write_preserves
[-help]
[-dont_touch]
[-dont_use]
[-obj_types {design hinst module inst net hnet pin hpin base_cell}]
[-out_file string]
```

Writes preserve constraints in a consumable TCL file so that the exported file can sourced.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>write_preserves</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man write_preserves</code>
-dont_touch	Writes the preserve constraints only for the non-default attributes related to the <code>dont_touch</code> object.
-dont_use	Writes the preserve constraints only for the non-default attributes related to the <code>dont_use</code> object.
<code>-obj_types {design hinst module inst net hnet pin hpin base_cell}</code>	
	Writes the preserve constraints only for the specific object types.
<code>-out_file <i>string</i></code>	Displays the TCL file name.

To set the value of any root attribute, use the [set_db](#) command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the [get_db](#) command:

```
get_db attribute_name
```

To get the current value of all attributes in the [check_ac_limit](#) category, use the following command:

```
get_db -category check_ac_limit
```

check_ac_limit_additional_individual_violation_report

```
check_ac_limit_additional_individual_violation_report {true | false}
```

Default: false

Data_type: Boolean

Specifies to generate separate violation reports for each current waveform calculation method ([rms](#), [peak](#), or [avg](#)). If this attribute is not specified, a single violation report file is generated using

the [check_ac_limit_method](#)

{[RMS](#) [AVG](#) [peak](#)} attribute. This attribute gives you the flexibility of generating either a single collated report or individual reports for each analysis method.

Example:

```
set_db check_ac_limit_method {rms peak avg} \  
check_ac_limit_out_file context1.rpt \  
...  
check_ac_limit_additional_individual_violation_report true
```

This command will generate 3 different reports, namely [context1.rpt_avg](#), [context1.rpt_peak](#), and

`context1.rpt_rms`. If there are no EM violations for a method, the tool will not generate the corresponding separate report. In this example, if there are violations for `avg` and `rms` but none for `peak`, then it will generate only two reports, `context1.rpt_avg` and `context1.rpt_rms`.

check_ac_limit_avg_recovery

```
check_ac_limit_avg_recovery em_recover
```

Default: 1.0

Data_type: Double

Specifies the recovery factor used for calculating I_{avg} current density with recovery. By default, the recovery factor (per layer) is read from the QRC techfile. If you specify `em_recover`, it overrides the QRC tech `em_recover` factor for all layers used in I_{avg} limits. The minimum value of this attribute is -1 and the maximum is 1.

check_ac_limit_check_thermal_aware_em

```
check_ac_limit_check_thermal_aware_em {true | false}
```

Default: false

Specifies to use the thermal map for EM checks. The thermal map file is specified using the `set_rail_analysis_config -read_thermal_map` parameter. The Rail Analysis engine uses the temperature specified in the thermal map file for EM analysis. EM limit has a strong temperature dependency. For a chip that has substantial temperature variation across the chip, the Rail Analysis engine can use the temperature specified in the thermal map file to perform accurate EM analysis.

check_ac_limit_current_file

```
check_ac_limit_current_file filename
```

Default: ""

Data_type: String

Specifies the current of a macro's output pins for EM calculation, in case the macro does not have the respective timing library. When the macro output pin current is set by the current file, the value calculated (if any) from AAE is overwritten.

check_ac_limit_current_scale_factor

```
check_ac_limit_current_scale_factor {{avg value} {rms value} {peak value}}
```

Default: ""

Data_type: String

Scales the signal EM current by the respective factor for avg, rms, or peak current specified by {avg value} {rms value} {peak value}.

The value specified for this attribute must be > 0 and <= 10.

check_ac_limit_current_scale_table

`check_ac_limit_current_scale_table current_scale_table_file`

Default: ""

Data_type: String

Specifies the name of the scale table file used for layer-based scaling of the signal EM current. The scale table contains the scale factor for avg, rms, or peak current for each layer.

check_ac_limit_default_freq_for_unconstrained_nets

`check_ac_limit_default_freq_for_unconstrained_nets freq_in_Hz`

Default: 1e+06

Data_type: Double

Specifies the frequency for EM calculation when a net has no defined frequency or has a defined frequency of 0 Hz in the design.

check_ac_limit_delta_temperature

`check_ac_limit_delta_temperature temp`

Default: 5.0

Data_type: Double

Specifies the maximum temperature rise permitted in units of Celsius. This value is normally used in the QRC tech file for the RMS current limit equation. For example:

```
em_jmax_ac_rms EQU sqrt(12.66 * delta_T * (w - 0.003)^2 * (w - 0.003 + 0.264) / (w - 0.003 + 0.0443))
```

check_ac_limit_delta_temperature_layer_list

`check_ac_limit_delta_temperature_layer_list {{<LEF_layer_name> <delta_T_in_C>}}+`

Default: ""

Data_type: String

Specifies the delta temperature for specific LEF layers during signal EM RMS current limit analysis.

check_ac_limit_detailed

check_ac_limit_detailed

Default: false

Data_type: Boolean

Generates a detailed report containing information for all signal nets, including those without violations.

check_ac_limit_effort_level

check_ac_limit_effort_level {low | medium | high}

Default: low

Data_type: Enum

Specifies the method used for current calculation of nets in the Signal ElectroMigration analysis flow. The two methods are:

- **non-simulation mode** - use the capacitance ratio to distribute the current down the stream from the driver to the receiver.
- **simulation mode** - simulates resistance and capacitance to get the true current on each segment. This mode is more accurate but requires a longer run time.

This attribute has the following three arguments:

- **low:** enables the non-simulation mode for all nets where the current distribution is based on the capacitance ratio.
- **medium:** enables the simulation mode for the nets with physical loops, and the non-simulation mode for the non-loop nets.
- **high:** enables the simulation mode for all nets.

The **medium** and **high** levels require a VTS-AA license.

Note: For the simulation mode with effort level **medium** or **high**:

- If you use `extract_rc`, run `set_db extract_rc_qrc_cmd_type partial extract_rc_qrc_cmd_file qrc.user.cmd`, where `qrc.user.cmd` must include the following CCL commands:
`extraction_setup -analysis em -cluster_vias_in_em true`

```
output_db -type spef -subtype "EXTENDED"
```

Refer to the example below:

```
output_db \  
-type spef -busbit_delimiter "[" -escape_special_character false \  
-hierarchy_delimiter "/" -output_incomplete_nets true \  
-output_unrouted_nets true -pin_delimiter ":" -subtype "EXTENDED" \  
-disable_subnodes false -add_explicit_vias true \  
-include_parasitic_res_width true -include_parasitic_res_width_drawn true
```

- If you run standalone Quantus to generate the required SPEF file in the extended format separately, then instead of `extract_rc`, use the following command for signal EM analysis:

```
read_spef -keep_star_node_locations -extended spef_file
```

check_ac_limit_em_cdf_percentage

```
check_ac_limit_em_cdf_percentage value
```

Default: 1e-09

Data_type: bool, read/write

Calculates the Cumulative Distribution Factor (CDF) derating factor based on the EM rules specified in the ICT EM file, given by the `check_ac_limit_ict_em_models` attribute. This attribute is used to calculate the fail rate and reliability of a design. The value of the CDF percentage should be between 0 and 100.

When the CDF related rule exits in the ICT EM file, the software uses the default value 1e-09 for `check_ac_limit_em_cdf_percentage` if it is not specified.

check_ac_limit_em_limit_scale_factor

```
check_ac_limit_em_limit_scale_factor {{avg value} {rms value} {peak value}}
```

Default: ""

Data_type: String

Scales the calculated signal EM limits by the respective factor for avg, rms or peak current limit specified by `{avg value} {rms value} {peak value}`. The software compares the current through the net against the scaled EM limit to report violations in signal EM.

The value specified for this attribute must be > 0 and <= 10.

check_ac_limit_em_limit_scale_table

check_ac_limit_em_limit_scale_table *em_limit_scale_table_file*

Default: ""

Data_type: String

Specifies the name of the scale table file used for layer-based scaling of the signal EM limit. The scale table contains the scale factor for avg, rms, or peak current for each layer.

check_ac_limit_em_res_width

check_ac_limit_em_res_width {drawn silicon}

Default: drawn

Data_type: Enum

Specifies width used to get EM limit.

check_ac_limit_em_temperature

check_ac_limit_em_temperature *value*

Default: -1.0

Data_type: Double

Specifies the temperature expected for the device and is used to look up the temperature scaling factor. By default, no scaling is done. The *value* is a float, in units of degrees Celsius.

check_ac_limit_em_temperature_layer_list

check_ac_limit_em_temperature_layer_list {{<LEF_layer_name> <em_temperature_in_C>}+}

Default: ""

Data_type: String

Sets a different temperature for specific LEF layers during signal EM AVG current limit analysis.

check_ac_limit_em_threshold

check_ac_limit_em_threshold *value*

Default: 1.0

Data_type: Double

Specifies to report violations in signal EM above the threshold value. The value is the ratio of signal current (avg/peak/rms) to the respective EM limit.

check_ac_limit_enable_seb

`check_ac_limit_enable_seb {true | false}`

Default: false

Data_type: Boolean

Specifies to enable the Statistical ElectroMigration Budgeting (SEB) analysis.

check_ac_limit_env_temperature

`check_ac_limit_env_temperature value`

Default: -1.0

Data_type: Double

Specifies the ambient temperature used to calculate S_{DC} for SEB analysis.

check_ac_limit_extraction_tech_file

`check_ac_limit_extraction_tech_file filename`

Default: ""

Data_type: String

Specifies an extraction technology file for the Signal ElectroMigration analysis flow. If this attribute is not specified, then by default the extraction technology file will be taken from the analysis view (current RC corner).

check_ac_limit_force_hold_view

`check_ac_limit_force_hold_view`

Default: false

Data_type: Boolean

Forces `set_signal_em_analysis_mode` to use the hold view for current calculation even during setup fixing.

check_ac_limit_handle_pin_obs_via

check_ac_limit_handle_pin_obs_via

Default: false

Data_type: Boolean

Specifies to consider the vias defined in the `obs` (obstructions/blockages) section of LEF in the Signal ElectroMigration flow. By default, the software does not consider via in obstruction.

This attribute does not honor the via obstructions with "SPACING 0".

check_ac_limit_ict_em_models

check_ac_limit_ict_em_models file

Default: ""

Data_type: String

Specifies the ICT-EM file which only contains the EM rules and excludes the RC extraction data in ICT. The software will use the EM rules in the specified ICT-EM file to calculate EM limits for signal net EM analysis even if there are embedded EM rules in the Quantus QRC tech file.

check_ac_limit_ircx_models

check_ac_limit_ircx_models {RC.ircx EMIR.ircx}|{RC.ircx}

Default: ""

Specifies an encrypted or unencrypted RC/EM technology (.ircx) file. The foundry-specific IRCX file, which contains the process information for extraction and EM modeling, can be used when the ICT-EM file is not available for electromigration analysis.

You can either specify two IRCX files, one file containing the RC process data (`RC.ircx`) and the other file containing EM rules (`EM.ircx`), or a single IRCX file that includes both the RC and EM sections (`RC.ircx`). A single IRCX file is used for the mature nodes, and separate RC and EM IRCX files are used for the advanced process nodes.

check_ac_limit_lifetime

check_ac_limit_lifetime value

Default: 87600.0

Data_type: Double

Specifies the total hours of operation expected for the device, and is used to look up the lifetime scaling

factor. *value* is used to find the scaling factor by interpolating from a piece-wise-linear table in the LEF or the QRC tech file (em_jmax_ac model with jmax_lifetime table). If there is no scaling factor table, no scaling is done. *value* is a float, in units of hours.

check_ac_limit_lifetime_rating_factor_file

check_ac_limit_lifetime_rating_factor_file *filename*

Default: ""

Data_type: String

Specifies a lifetime rating factor file that contains jmax_life values for each layer. These values are defined based on temperature and lifetime pairs. When you provide this file, EM analysis will automatically select the appropriate jmax_life factor for each layer according to the specific temperature-lifetime combinations defined within the file. The lifetime and EM temperature can be specified using the check_ac_limit_lifetime and check_ac_limit_em_temperature attributes.

Following is a snippet of the lifetime rating factor file:

```
*Rating factor of M0/V0/M1/V1/M2/V3/M3...
TEMPERATURE      90      95      100      105      110 ...
LifeTime
-----
0.5              2.578    2.242    2.024    1.774    1.547
1                2.520    2.191    1.979    1.734    1.512
2                2.430    2.113    1.908    1.672    1.458
3                2.382    2.072    1.871    1.639    1.430
...
-----
```

check_ac_limit_max_error

check_ac_limit_max_error *value*

Default: 10000

Data_type: Integer

Specifies the maximum number of errors to report. The command stops when the maximum value is reached.

check_ac_limit_method

check_ac_limit_method {rms peak avg}

Default: ""

Data_type: String

Specifies the current waveform calculation method. You can specify one or more of the following options:

- **avg:** Checks I_{avg} limits and reports any average current limit violations in the design.
- **peak:** Checks I_{peak} limits and reports any peak current limit violations in the design.
- **rms:** Checks I_{rms} limits and reports any RMS current limit violations in the design.

check_ac_limit_min_peak_duty_ratio

`check_ac_limit_min_peak_duty_ratio duty_ratio`

Default: -1.0

Data_type: Double

Sets the minimum duty ratio value for I_{peak} calculation. If the calculated duty ratio of a net is lower than the specified value, the specified value will be used to calculate I_{peak} . The minimum value for `duty_ratio` is 0.0 and the maximum is 1.0.

check_ac_limit_min_peak_freq

`check_ac_limit_min_peak_freq freq_in_Hz`

Default: 1e+06

Data_type: Double

Ignores I_{peak} current limit calculation for signal nets that have an effective frequency below the specified value (in Hertz).

check_ac_limit_net_file

`check_ac_limit_net_file list_file`

Default: ""

Data_type: String

Specifies the net from file to check the signalEM analysis. The format is one net name per line, with comments using # as the first character. For example:

```
#list of nets to skip
net_a
```

net_b
net_c

check_ac_limit_nets

check_ac_limit_nets {netNames}

Default: ""

Data_type: String

Specifies whether to check named or selected nets. If you name only one net, you do not need the braces around the net name. If you specify more than one net, you must separate the net names with a space.

check_ac_limit_out_file

check_ac_limit_out_file filename

Default: ""

Data_type: String

Specifies the report file for the violation data. The report file includes name of the net, I_{rms} , interpolated ACCURRENTDENSITY limit (I_{limit}), layer, width, X and Y location, rise and fall time, effective frequency for the net (F_{eff}), Cnet and Vdd for each net.

check_ac_limit_peak_td_method

check_ac_limit_peak_td_method {effective_width_from_integration effective_half_peak_width
max_equivalent_dc_peak sum_half_peak_width}

Default: effective_width_from_integration

Data_type: Enum

Specifies the Td calculation method for lpeak check. The legal values are depicted below.

effective_width_from_integration

- $T_d = \frac{\int_0^{T_{\text{SW}}} |I(t)| dt}{I_{\text{peak_measured}}}$
 - T_{sw} = Period of one switching cycle (rising + falling)
 - $I_{\text{peak_measured}} = \text{abs.max}(I_{\text{peak(rising)}}, I_{\text{peak(falling)})}$

effective_half_peak_width

- When $I_{\text{peak(rising)}} \geq I_{\text{peak(falling)}}$
 $T_d = T_d(\text{rising}) + \left(\frac{I_{\text{peak(falling)}}}{I_{\text{peak(rising)}}}\right)^2 * T_d(\text{falling})$
- When $I_{\text{peak(rising)}} < I_{\text{peak(falling)}}$
 $T_d = T_d(\text{falling}) + \left(\frac{I_{\text{peak(rising)}}}{I_{\text{peak(falling)}}}\right)^2 * T_d(\text{rising})$

max_equivalent_dc_peak

- $R(\text{rising}) = Td(\text{rising}) / (T/2)$
- $R(\text{falling}) = Td(\text{falling}) / (T/2)$
- Choose $\max(I_{\text{peak(rising)}} \cdot \sqrt{R(\text{rising})}, I_{\text{peak(falling)}} \cdot \sqrt{R(\text{falling})})$ to compare against $I_{\text{peak_dc_limit}}$
- $I_{\text{peak_ac_limit}} = I_{\text{peak_dc_limit}} / \sqrt{R}$
- When $I_{\text{peak(rising)}} \cdot \sqrt{R(\text{rising})} \geq I_{\text{peak(falling)}} \cdot \sqrt{R(\text{falling})}$
 $Td = 2 \cdot Td(\text{rising})$
- When $I_{\text{peak(rising)}} \cdot \sqrt{R(\text{rising})} < I_{\text{peak(falling)}} \cdot \sqrt{R(\text{falling})}$
 $Td = 2 \cdot Td(\text{falling})$

sum_half_peak_width

- $Td = Td(\text{rising}) + Td(\text{falling})$

check_ac_limit_read_detail_delta_temperature_file

`check_ac_limit_read_detail_delta_temperature_file filename`

Default: ""

Data_type: String

Specifies to read the detailed delta temperature file generated by the `report_self_heat` command (self-heat analysis).

check_ac_limit_seb_lifetime

`check_ac_limit_seb_lifetime value`

Default: 43800.0

Data_type: Double

Specifies the life time of product in hours.

check_ac_limit_seb_table

`check_ac_limit_seb_table table_filename`

Default: ""

Data_type: String

Specifies the file name of the Failures in Time (FIT) table. This file is provided by the foundry. The file has the following columns:

- Layer
- MTF
- Sigma
- Activate energy
- Current density exponent

check_ac_limit_seb_temperature

`check_ac_limit_seb_temperature temperature`

Default: -273.0

Data_type: Double

Specifies the temperature used to update the median time to failure (MTF) with respect to the ambient

temperature.

- If this temperature is specified, it would be used globally for all the resistors.
- If this temperature is not specified, the `seb_temperature` may take the following possible values depending on the specific circumstances:
 - If detailed delta temperature file is not used for SEB, the `seb_temperature` always takes the same value as that used for EM analysis.
 - If detailed delta temperature file is used for SEB, the `seb_temperature` is calculated by the following equation:

$$\text{seb_temperature} = \text{env_temperature} + \text{delta_T}$$

Where `delta_T` is the maximum temperature rise, including joule heat and coupling heat from FEOL, in the resistor's bounding box with zero extension.

check_ac_limit_report_db

`check_ac_limit_report_db`

Default: `false`

Data_type: Boolean

Specifies to write the signal EM data into a database file (`filename.db`) after performing signal EM analysis. This file contains the information required for loading and displaying signal EM data in GUI.

check_ac_limit_report_unannotated_shapes

`check_ac_limit_report_unannotated_shapes {true | false}`

Default: `false`

Data_type: Boolean

Provides visibility into partial net coverage within SPEF files. When this attribute is set to `true`, the `<report_name>.rpt.unannotated_shapes` is generated. This report identifies and lists nets that contain shapes without resistance annotations, or unanalyzed/partially analyzed segments. The feature helps to detect incomplete parasitic extraction coverage and improve accuracy during validation and signoff workflows. The reporting of partial net coverage works only when `check_ac_limit_effort_level` is set to `high`.

Use Model:

```
set_db check_ac_limit_effort_level high check_ac_limit_report_unannotated_shapes true
```

Report Format:

NET: `<net_name>` <- Specifies the name of the analyzed simulation nets with

unannotated shapes

LAYER (x1 y1 x2 y2) <- Layer name and shape coordinates

Sample Report:

NET: Net_A

LAYER	(x1	y1	x2	y2)
M2	(30.2850	12.0800	37.6150	12.2200)
M2	(30.2000	12.0650	30.2850	12.2350)

 This attribute is applicable only when running in the DP mode; it is not supported in the XP mode.

check_ac_limit_selected

check_ac_limit_selected *filename*

Default: false

Data_type: Boolean

Analyzes the net specified by selecting a net in the main GUI window.

check_ac_limit_simulation_net

check_ac_limit_simulation_net *list_of_nets*

Default: ""

Forces the specified nets to use the simulation mode.

check_ac_limit_simulation_net_file

check_ac_limit_simulation_net_file *filename*

Default: ""

Forces the nets in the specified file to use the simulation mode.

check_ac_limit_skip_category_mode

check_ac_limit_skip_category_mode {0 | 1 | 2}

Default: 1

Data_type: Integer

Specifies to skip nets that belong to categories mapping to the specified mode. This parameter allows you to specify three modes, namely 0, 1 (default), and 2.

The following table lists the common categories for all modes, and the categories specific to each mode:

Common Categories	0 Skip Category Mode	1 Skip Category Mode	2 Skip Category Mode
• Non top scope nets • Internal nets on boundary path • P/G nets • Constant nets • User-defined skipped nets • Nets below effective frequency threshold • Physically broken nets • Nets without loading capacitance annotation • Nets with SPEF back-annotation failures during simulation • Nets failed in analysis	• Slave nets by Verilog Assign • Nets (non-constant) without frequency annotation • Nets without physical shape for output pin • Nets without wire shape connection to output pin • Nets with zero pin current	• Equivalent nets by Verilog Assign • Nets without driver • Nets without receiver	• Nets without pins • Equivalent nets by Verilog Assign • Nets without driver • Nets without receiver

For example, if you set `set_signal_em_analysis_mode -skip_category_mode` to 1, the report file lists all categories listed in the *Common Categories* and *1 Skip Category Mode* columns.

Following is a snippet of the report file for mode 1:

```

Total Nets in Design:          33451
Total Selected Nets in Design:    4
Total Analyzed Nets:           0
Total Skipped Nets:            4
  Non top scope nets:          0
  Internal nets on boundary path: 0
  Equivalent nets by Verilog Assign: 0
  P/G nets:                    0
  Constant nets:                2
  User-defined skipped nets:    0
  Nets below effective frequency threshold: 0
  Nets without driver:          1
  Nets without receiver:        1
  Physically broken nets:       0
  Nets without loading capacitance annotation: 0
  Nets with SPEF back-annotation failures during simulation: 0
  Nets failed in analysis:      0

```

check_ac_limit_skip_net

`check_ac_limit_skip_net net_name_list`

Default: ""

Data_type: String

Specifies the net to be skipped in the signalEM analysis.

Refer to the example below:

```
{net_a net_b net_c}
```

check_ac_limit_skip_net_file

```
check_ac_limit_skip_net_file list_file
```

Default: ""

Data_type: String

Specifies the net file to be skipped in the signalEM analysis.

The format is one net name per line, with comments using # as the first char. For example:

```
#list of nets to skip  
net_a  
net_b  
net_c
```

check_ac_limit_toggle

```
check_ac_limit_toggle value
```

Default: 1.0

Data_type: Double

Specifies the switching factor for signal nets. A value of 1.0 means that if a flip-flop is clocked by a 20 Mhz clock, it changes state on 100% of the clock cycles. Therefore, the signal has 20 million transitions, which is half the number of transitions of the input clock. As a result, the final switching frequency of the signal net is 10 Mhz.

Value Range: 0.0 to 1.0

check_ac_limit_top_scope_ignore_block_internal_nets_on_boundary_path

```
check_ac_limit_top_scope_ignore_block_internal_nets_on_boundary_path {true | false}
```

Default: false

Ignores the internal nets from the first instance to the first flop on the boundary path for the signal EM checking. The following figure represents that when this parameter is used, the internal nets (highlighted in the blue rectangles) are ignored. However, all the nets highlighted through the red lines are reported in the TOP scope (create_top_scope) flow:

check_ac_limit_use_db_freq

check_ac_limit_use_db_freq

Default: false

Data_type: Boolean

Uses the database frequency value as the effective frequency per net.

check_ac_limit_use_qrc_tech

check_ac_limit_use_qrc_tech

Default: true

Data_type: Boolean

Forces I_{rms} checks to use the QRC tech file instead of the technology LEF file. If either I_{peak} or I_{avg} is also checked, all checks will use the QRC tech file, including I_{rms} . This attribute is enabled by default.

Note: The `-method avg` and `-method peak` analysis will only support AC current density rules from QRC tech file. If either `avg` or `peak` is also specified, then all checks will use the QRC tech file equations, including RMS.

check_ac_limit_use_rms_delta_t

check_ac_limit_use_rms_delta_t {true | false}

Default: false

Data_type: Boolean

When this parameter is set to `true`, the `delta_T` used to calculate `seb_temperature` would be based on the RMS delta T (joule heat only).

If this parameter is set to `false`, the `delta_T` used to calculate `seb_temperature` would be based on the sum of self-heat delta T and RMS delta T.

check_ac_limit_view

```
check_ac_limit_view viewName
```

Default: ""

Data_type: String

Specifies the name of the view.

check_ac_limits

```
check_ac_limits  
[-help]
```

Checks for the following types of AC current violations on signal nets:

- Root-mean-square (RMS) current limit violations (I_{rms} violations)
- Peak current limit violations (I_{peak} violations)

In addition, `check_ac_limits` can be used for average current limit (I_{avg}) analysis.

AC current limit violations are sometimes also referred as wire self-heat violations. DRC manuals have these current limits to avoid over-heating a signal-nets wire with too much AC current. To prevent wire self-heating or AC signal electromigration, signal interconnects should be analyzed for their AC current carrying capacity and measured against the AC current limits specified by foundry.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>check_ac_limits</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man check_ac_limits</pre>
--------------------	---

Related Commands

check_power_vias

```
check_power_vias
[-help]
[-append]
[-area {x1 y1 x2 y2}]
[-check_fill]
[-check_wire_pin_overlap]
[-cut_area_ratio value]
[-edge_to_edge]
[-error integer]
[-exclude_region_file check_file]
[-hookup_pitch pitch_value]
[-ignore_objects {drc_fill | io_wire}]
[-ignore_partial_overlap {true | false | value}]
[-layer_range {bottomLayer topLayer}]
[-nets {netNames} | -selected]
[-non_orthogonal_check [-non_orthogonal_distance {x y}]]
[-pitch pitch_value]
[-rail_layers layer_name]
[-report file]
[-search_range {x y}]
[-shielding]
[-stacked_via]
[-stripe_layers layer_list]
[-stripe_rule value]
[-what_if_report filename]
[-width_range string]
```

This command has a variety of power-rail overlap checks to look for missing power-grid vias. By default, it checks that orthogonal power-routes on adjacent routing layers have a via between them at every intersection. For example, there should be a via at the point where a Metal3 power stripe overlaps a Metal2 power stripe. By default, horizontal routes get checked only for overlaps with vertical routes. If the power shapes are polygon, the polygon is split into rectangles and the rectangles are used to decide the direction. Support for checking stacked vias between non-adjacent routing layers is optional. Violations are highlighted in the layout window, and a text report is generated with the location of the missing vias.

Parameters

-help	Outputs a brief description that includes the type and default information for the <code>check_power_vias</code> parameter. For a detailed description of the command and all its parameters, use the <code>man</code> command: <pre>man check_power_vias</pre>
-append	Specifies that all previous <code>check_power_vias</code> settings will be kept.
-area <i>x1 y1 x2 y2</i>	Specifies the coordinates of the area to be checked.
-check_fill	Specifies that tied-off metal fill should also be checked. Floating fill is ignored. <i>Default:</i> Metal fill will be ignored.
-check_wire_pin_overlap	Specifies that wire overlaps of pin shapes should also be checked. Wire overlaps with wires are checked.
-cut_area_ratio <i>value</i>	Checks if the cut area in the metal intersection area is sufficient. $\text{cut_area_ratio} = \text{Total cut area} / \text{Metal intersect area}$ If the actual ratio is less than specified ratio, <code>check_power_vias</code> marks the area as a problem. By default, the metal intersection area is the metal overlap area. If <code>via_using_exact_crossover_size</code> is set to <code>false</code>, the partial overlap is extended to full width intersection area.
-edge_to_edge	Checks the non-orthogonal distance from edge to edge within a layer.
-error <i>integer</i>	Specifies the maximum number of errors to report.
-exclude_region_file <i>check_file</i>	Ignores missing VIA checks within the specified <code>check_file</code> regions. The <code>check_file</code> format can be a set of the following values: • <code>cell</code>: Specifies the cell type. • <code>ext_layer_bottom</code>: Specifies the extension area bottom layer. • <code>ext_layer_top</code>: Specifies the extension area top layer. • <code>ext_x</code>: Specifies the extension length in the X direction. • <code>ext_y</code>: Specifies the extension length in the Y direction. • <code>exc_x</code>: Specifies the exception length in the X direction. • <code>exc_y</code>: Specifies the exception length in the Y direction. Example 1: The following set of <code>check_file</code> formats ignores missing VIA check

rectangle (in the output), but checks missing VIA within the blue rec

FTV_CELL, B_M0, B_M1, X, Y, X', Y'

$$\text{INV_D2, M0, M1, X2, Y2, X2', Y2'}$$

Following is the output:

Example 2:

The following set of `check_file` formats ignores missing VIA check rectangle (in the output):

FTV_CELL, B_M0, B_M1, X, Y

INV_D2, M0, M1, X2, Y2

Following is the output:

<code>-hookup_pitch <i>pitch_value</i></code>	Specifies the distance between two vias, which are on the filler inst greater than or equal to the given value.
<code>-ignore_objects {drc_fill io_wire}</code>	Skips checking the power vias of the specified wire type.

<pre>-ignore_partial_overlap {true false value}</pre>	Specifies if the partially overlapped metal layers need to be checked. Specify one of the following parameter values: • <code>true</code>: Ignores checking the vias missing in partially overlapped metal layers. • <code>false</code>: Checks the vias missing in partially overlapped metal layers. • <code>value</code>: Checks the vias missing in partially overlapped metal layers for the specified portion of <code>value</code> range from 0 to 1. For example, specifying 0.2 will check the vias missing in partially overlapped metal layers for 20% of the overlapped wires.  The instance pin and physical pin shapes are considered. <i>Default:</i> <code>false</code>
<pre>-layer_range {bottomLayer topLayer}</pre>	Checks for the missing stacked vias between the bottom and top layers for the missing vias between all the adjacent intermediate layers, but not for the stacked vias between the intermediate layers. While using this command, you can specify full layer names like <code>METAL1</code>, or abbreviations like <code>1</code>. For example, <code>check_power_vias -layer_range {2 5}</code> checks for missing stacked vias between overlapping <code>metal2</code> and <code>metal5</code>, and also missing vias for overlapping layers. This parameter checks the missing adjacent vias if <code>bottomLayer</code> is specified but <code>topLayer</code> is not, with considering that <code>topLayer</code> is just one layer above <code>bottomLayer</code>. To check the missing stacked via or missing adjacent via DRC marker, use the <code>gui_show_markers</code> command for filtering the DRC marker. For example: 1. To display only the missing stacked via DRC markers, run: <pre>gui_show_markers -all -filter {stacked via} -search_desc filter_mode AND</pre> 2. To display only the missing via DRC markers between the adjacent layers, run: <pre>gui_show_markers -all -filter {adjacent via} -search_desc filter_mode AND</pre> See gui_show_markers for more information on the command usage.
<pre>-nets {netNames}</pre>	Specifies the names of the power nets that will be checked. A single name can be enclosed in curly braces({}) or quotes (" ") can be specified. Wildcards are supported. For example, when you specify <code>check_power_vias -nets {v*}</code>, all power net names having initial letter as <code>v</code> are checked. Note: Currently, wildcards are supported for checking PG nets only. <i>Default:</i> All power grid nets.

<code>-non_orthogonal_check</code>	Checks the overlap area for non-orthogonal crossing wires (e.g. wires in the same direction) in adjacent as well as non-adjacent layers. Checks for missing vias between two or more parallel wires. The via center-to-center distance between parallel wires should be less than or equal to the specified spacing. If this parameter is not specified, horizontal wires get checked only for vertical wires. Note: You can use <code>-non_orthogonal_distance {x y}</code> parameter with <code>-non_orthogonal_check</code> to find missing vias within a specified window. If a distance is provided, <code>check_power_vias</code> checks if the wire is parallel to the via. If yes, it checks the via center-center spacing and via center-wire end distance between parallel wires. If the actual distance is greater than the specified distance, it marks a violation.
<code>-non_orthogonal_distance {x y}</code>	Specifies distances for finding missing via within a specified window for the non-orthogonal check, with <code>x</code> and <code>y</code> representing the distance in the horizontal and vertical directions, respectively. When the <code>x</code> or <code>y</code> distance is provided, <code>check_power_vias</code> checks if there is a via within the specified distance with another wire. If yes, it checks: • The via center to via center spacing between parallel wires against the value $x/2$ ($y/2$) • The via center to wire end distance against the value $x/2$ ($y/2$) If the actual distance is greater than the required distance in either direction, it marks a violation. When the <code>x</code> or <code>y</code> distance is not provided or set to 0, the via to via distance is checked. Note: This parameter can only be specified with the <code>-non_orthogonal_check</code> parameter.
<code>-pitch pitch_value</code>	Specifies the distance between two vias, which are not on the filler. The distance should be greater than or equal to the given value.
<code>-rail_layers layer_name</code>	Specifies a single power rail layer for missing via (only the via above the rail layer is checked). The check depends on the <code>-stripe_rule</code> option. When <code>-stripe_rule</code> is specified, the via to via distance should be less than or equal to the specified distance. If a distance value is not specified with the <code>-stripe_rule</code> option, the check is not performed. See the examples below. The <code>-rail_layers</code> option is not controlled by <code>-layer_range</code>. You can specify any rail layer other than that specified with <code>-layer_range</code> for checks against <code>stripe_rule</code> and <code>search_range</code> rules.
<code>-report file</code>	Specifies the name of the output file for the report.

<code>-search_range {x y}</code>	Specifies a rectangle area with <code>xy</code>. There should be one valid connection rail to power stripe in the specified area. By default, the valid connection is searched from the uppermost power rail layer to all the power stripe layers. Use the <code>-rail_layers</code> option to specify the power rail layer, and the <code>-stripe_layers</code> option to limit the power stripe layers. With the <code>-rail_layers</code> and <code>-stripe_layers</code> options, only the specified power rail and power stripes layers are checked for the connection check. The <code>x</code> and <code>y</code> values are floats in units of microns. Refer to the Examples section for search range examples.
<code>-selected</code>	Checks for the missing vias between the selected PG wires and other selected/unselected PG wires. When this parameter is used with the <code>check_wire_pin_overlap</code> parameter, it checks for the missing vias between the intersection of selected PG wires and pins of the selected instance; it eliminates the requirement of running the command on the entire design, which improves the run time.
<code>-shielding</code>	Specifies that shielding wires should also be checked. By default, shielding wires are not checked.
<code>-stacked_via</code>	Checks for missing vias between all non-adjacent as well as adjacent vias.
<code>-stripe_layers layer_list</code>	Specifies the power stripe layers to be checked for a valid connection rail to power stripe. The check depends on the <code>-search_range</code> option. If <code>-search_range</code> is specified, at least one valid connection path should be found from the power stripe in that search range. If a search range is not specified with the <code>search_range</code> option, the check is ignored. You can specify the power rail layer with the <code>-rail_layers</code> option. If <code>-rail_layers</code> is not specified, the uppermost power rail layer is checked. See the examples below. The <code>-stripe_layers</code> option is not controlled by <code>-layer_range</code>. You can specify any power stripe layers other than that specified with <code>-layer_range</code> for checks using the <code>search_range</code> rule.
<code>-stripe_rule value</code>	Specifies in microns the distance for power via. Only the power via above the power rail is checked. If the via to via center-to-center spacing is greater than the <code>value</code>, a violation marker is created. You can specify the power rail layer with <code>-rail_layers</code> for checking the power via above the uppermost power rail is checked against the <code>stripe_rule</code>. Refer to the Examples section for stripe rule examples.
<code>-what_if_report filename</code>	

	Writes out <code>check_power_vias</code> violations data into a ECO file that can be used as input for what-if rail analysis. When you specify this parameter, the information generated can be used as input for what-if virtual wires
<code>-width_range string</code>	Specifies the metal width to be considered. <code>check_power_vias</code> uses <code>width_range</code> to filter wires. Only the bottom and top wires that fall in the range specified by <code>width_range</code> are considered. The <code>string</code> value takes the following format: <pre>-width_range {minWidth maxWidth [layerName ...] [minWidth maxWidth ...] ... }</pre> • If <code>minWidth</code> is 0, all wires with width less than specified <code>maxWidth</code> are considered. • If <code>maxWidth</code> is 0, all wires with width greater than specified <code>minWidth</code> are considered. • If <code>layerName</code> is specified in the string, <code>width_range</code> is enabled only for the specified layer. • If no <code>layerName</code> is specified in the string, <code>width_range</code> is enabled for all layers. Refer to the Examples section for width range examples. Note: Use braces or quotation marks to enclose the string value for

Examples

- Specifies that all vias for all powergrid nets will be checked, except for metal fill and shielding wires, and reports it to a file called `power_via.report`:

```
check_power_vias -report power_via.report
```

- The following command checks for missing stacked vias between `METAL5` and `METAL8` layer intersections on the VSS net. In addition, it checks for missing vias between `METAL5-METAL6`, `METAL6-METAL7` and `METAL7-METAL8` layer intersections. The violations are reported in the `powerVia.rpt` file and highlighted in GUI.

```
check_power_vias -layer_range {METAL5 METAL8} -nets VSS -report powerVia.rpt
```

- The following command checks that the overlapping power routes on adjacent layers have vias that cover at least 70% of the overlap area..

```
check_power_vias -cut_area_ratio 0.7
```

- The following command checks that the overlapping power routes have vias that cover at least 70% of the overlap area for layers between METAL3 and METAL4.

```
check_power_vias -cut_area_ratio 0.7 -layer_range {METAL3 METAL4}
```

- The following command checks for wires overlaps for all pin shapes included, enclosed, or touched by the specified area:

```
check_power_vias -area {100 100 1000 1000} -check_wire_pin_overlap
```

- The following command checks wires with width greater than 0.032 and less than 0.096 for all layers:

```
check_power_vias -width_range {0.032 0.096}
```

- The following command checks wires with width in the 0.032 ~ 0.096 range for M1/M2 and width 0.038~0.114 for M3/M4. For other layers, there is no width control:

```
check_power_vias -width_range {0.032 0.096 M1 M2 0.038 0.114 M3 M4}
```

- The following command checks wires with width in the 0.032 ~ 0.096 range for M1/M2. For other layers, it checks wires with width in the 0.038~0.114 range:

```
check_power_vias -width_range {0.032 0.096 M1 M2 0.038 0.114}
```

- The following command checks the via between power rail layer M2 and M3. If the via's center-to-center distance is more than 17u, the tool reports a violation and places a marker on the power rail wires.

```
check_power_vias -stripe_rule 17 -rail_layers M2
```

- The following command checks the valid connection for $M2$ power rail to stripe layer $M4$ and $M5$ with the search rectangle area 10×5 . In the diagram below, there is no violation as the connection is built from $M2$ to $M4$. If the $V34$ vias are removed, then there is a violation as the connection cannot be built from $M2$ to $M4$.

```
check_power_vias -search_range {10 5} -rail_layers M2 -stripe_layers {M4 M5}
```

create_marker

```
create_marker  
[-help]  
{-bbox {x1 y1 x2 y2} | -poly {x1 y1 x2 y2...}}  
[-description description]  
[-layer layerName]  
[-rule_map]  
[-sub_type subtypeName]  
[-tool toolName]  
[-type typeName]
```

Creates markers for violations in the database and imports DRC markers generated by other software applications. Use this command if you want to import only a specific marker or check a specific marker that has been created by a third party tool.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>create_marker</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man create_marker</pre>
<code>-bbox x1 y1 x2 y2</code>	Specifies the area of the bounding box of the marker. For example, <code>create_marker -bbox 100 100 100.5 100.5</code>. Type: Real
<code>-description description</code>	Describes the marker. For example, <code>create_marker -description "the user mark is non default rule spacing check"</code>. Default: "" Type: String
<code>-layer layerName</code>	Specifies the layer. For example, <code>create_marker -layer METAL2</code>. Type: String
<code>-poly {x1 y1 x2 y2...}</code>	Specifies the area of the bounding polygon of the marker.
<code>-rule_map</code>	Specifies if the marker needs to be created through <code>rule_map</code>.
<code>-sub_type subtypeName</code>	Specifies the marker subtype. For example, <code>create_marker -sub_type user_spacing</code>. Default: Other Type: String
<code>-tool toolName</code>	Specifies the source software application. For example, <code>create_marker -tool Tempus</code>. Default: Other Type: String
<code>-type typeName</code>	Specifies the marker type. For example, <code>create_marker -type user_verify</code>. Default: Other Type: String

Examples

- The following command generates markers for tool named `Calibre` with type `METAL1` and subtype `S.1`:

```
create_marker -bbox { 1 2 1 2 } -tool Calibre -type METAL1 -sub_type S.1
```

The violation browser displays the marker in the above example as follows:

```
+ Calibre
  + METAL1
    + S.1
      ...
```

- Suppose the cadence LPA tool has created the following marker on layer `METAL3`:

```
CDNLitho;SPACING; Severity: 3; MARKER_INFO: "CD = 45.39"
```

```
bbox = (468.248, 63.511) (468.310, 63.599)
```

The following command creates a corresponding marker in Tempus design:

```
create_marker -bbox {468.248 63.511 468.310 63.599} -layer M3 /
               -type CDNLitho -sub_type Spacing
```

Related Commands

[delete_markers](#)

delete_markers

```
delete_markers  
[-help]  
[-all]  
[-area {x1 y1 x2 y2}]
```

Deletes markers from a specified area or the entire design area.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>delete_markers</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man delete_markers</code>
-all	Deletes markers from the entire design area.
-area {x1 y1 x2 y2}	Specifies a bounding box for the area from which to delete markers. For example, <code>delete_markers -area {0 0 100 100}</code> .

Related Commands

[create_marker](#)

gui_show_markers

```
gui_show_markers
[-help]
[-ac_limit]
[-all]
[-append]
[-area {x1 y1 x2 y2}]
[-connectivity]
[-density]
[-display_by_layer]
[-geometry]
[-max_error_per_type value]
[-no_false_marker]
[-overlap]
[-process_antenna]
[-search_description]
[-short]
[-filter_query LO_formula | {-filter filterString -filter_mode {AND | OR | NOT}}]
```

Displays a list of violations in the. The software generates markers for the violations after you use one or more verification commands.

Geometry or Metal Density Violations

Updates geometry and metal density violation markers incrementally during an Tempus session--that is, it displays the markers generated the first time you run the `check_metal_density` command and adds new markers, or deletes markers, on subsequent runs during the same session. If the software finds violations during a subsequent run that were already found previously, the browser display does not change, as there is no incremental update.

The browser can make incremental changes because `check_metal_density` can check a small area of the design and update the database. As a result of this behavior, Tempus saves the information from the first verification run.

Connectivity, Process Antennas, or AC Limit Violations

Overwrites connectivity, process antenna, and AC limit violation markers if the `check_process_antenna`, or `check_ac_limits` commands are run more than once during an Tempus session. These commands are net-based, not area-based, so the browser does not make incremental updates for them. As a result of this behavior, Tempus does not keep the information from the first verification run.

Parameters

Parameters

-help	Outputs a brief description that includes type and default information for each <code>gui_show_markers</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man gui_show_markers</pre>
-ac_limit	Displays AC limit violations.
-all	Displays all the violations that are present in the design.
-append	Appends accumulated filtered markers to the existing markers in violation browser.
-area {x1 y1 x2 y2}	Specifies the coordinates of the area whose violations to display. For example, <code>gui_show_markers -area {0 0 100 100}</code> .
-connectivity	Displays connectivity violations.
-density	Displays metal density violations.
-display_by_layer	Displays the list of violations by the layer instead of route type.
-filter <i>filterString</i>	Specifies a text string in the violation message. Violation Browser searches the message of each violation and displays only the violations whose messages match the search conditions. To specify a list of strings, separate each string with a space. To specify a literal string with space in it, enclose the string in double quotation marks. For example, you can specify strings such as the following: • METAL5 • (600, 500) • METAL3 (700, 400) • "Pin of Net"
-filter_mode {AND OR NOT}	Specifies the condition for searching multiple strings in the violation browser. You cannot filter complex expressions because the <code>AND</code>, <code>OR</code>, and <code>NOT</code> parameters are mutually exclusive. • The <code>AND</code> and <code>OR</code> conditions work on single strings or multiple strings. • The <code>NOT</code> condition works only on a single string.

<code>-filter_query LO_formula</code>	Specifies a complex logical expression for filtering violations. This option cannot be used along with <code>-filter</code> or <code>-filter_mode</code>. You can specify the AND, OR, and NOT conditions in the search expression. Use: • <code>&&</code> between strings in the expression to specify the AND condition. • <code> </code> between strings in the expression to specify the OR condition. • <code>!</code> before a string to specify the NOT condition. Note that <code>!</code> is an one's complement operator. So for example, <code>!{object (net1) && layer (m2) }</code> is not allowed. The <code>-filter_query</code> parameter supports searches in the object, layer, and description areas. The area can be specified using the <code>object</code>, <code>layer</code>, and <code>desc</code> keywords. For example: <pre>object (net1) layer (m2) && desc (xxx)</pre> You can also use the wildcards <code>*</code> and <code>?</code> in the search expression. For example: <pre>!object (clk*) && layer (m?)</pre> To specify a literal string with space in it, enclose the string in double quotation marks. For example: <pre>!object (clk*) && desc ("prl spacing")</pre>
<code>-geometry</code>	Displays geometry violations.
<code>-max_error_per_type value</code>	Specifies a limit for the number of violations parsed for each violation type. For example, if you set <code>gui_show_markers -max_error_per_type 500</code>, the Violation Browser parses and displays only 500 markers per error type. Use this parameter if you are loading a large DRC file with millions of violations to prevent the database from becoming slow while loading the file and to limit the number of violations you review in the browser. By default, the Violation Browser displays all markers.
<code>-no_false_marker</code>	Prevents Tempus from displaying false violations.
<code>-overlap</code>	Displays overlaps in the design.
<code>-process_antenna</code>	Displays process antenna violations.
<code>-search_description</code>	Searches for text in the violation message and the violation description.
<code>-short</code>	Displays short violations.

Examples

The following command displays all violations whose marker title contains `METAL3`:

```
gui_show_markers -all -filter METAL3
```

The following command displays geometry violations whose marker title contains `METAL3` or `tdsp`:

```
gui_show_markers -geometry -filter {METAL3 tdsp} -filter_mode OR
```

The following command displays geometry violations whose marker title or marker description field contains `Min` and `0.24` and `METAL3`:

```
gui_show_markers -geometry -filter {Min 0.24 METAL3} -filter_mode AND -search_description
```

The following command displays violations occurring on Metal4 or Metal5 layers but excludes short violations:

```
gui_show_markers -filter_query {!Short && (m4 || m5)}
```

Related Commands

- [check_ac_limits](#)

read_markers

```
read_markers
[-help]
in_file fileName
[-orient {r0 r90 ...}]
[-rule_map_file mapName]
-type {Assura | Calibre | PVS | Hercules | ICV | cdn_litho | CDNCMP | inShapeLitho |
CalibreLitho | DRV | ClockTran | CLP | VerifyPower}
[-x_offset value]
[-y_offset value]
```

Loads a violation marker file or a hotspot interface format (HIF) file in one of the following formats and creates markers that the software can interpret. Use this command to load third-party markers into the tool:

- Assura[™]
- Calibre
- PVS
- Hercules
- ICV
- Cadence or Calibre HIF
- Chemical and Mechanical Polishing (CMP) HIF
- inShapeLitho
- Calibre litho hotspot
- NanoRoute litho
- Transition violation report
- Low power violation reports

After you load the file, you can view the markers in the Violation Browser. By cross-probing between Violation Browser and the design area, you can analyze the violations and take steps to resolve them. The Auto Query feature displays the rule names for the markers.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>read_markers</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man read_markers</pre>
<code>in_file fileName</code>	Specifies the marker file to load. Assura files must have a <code>.err</code> extension. Calibre files must have a <code>.db</code> extension.
<code>-orient {r0 r90 ...}</code>	Supports advanced orientation transforms for loading rotated DRC violation markers before loading. This helps in overlaying the design to the top of the layout.
<code>-rule_map_file mapName</code>	Specifies the rule map file for a PVS or Calibre Litho report. The rule map file provides the layer/error type information. <code>read_markers</code> saves this information to the database. When the markers are created, the layer, error type, and object information can be identified on the GUI in the Violation Browser. NR could fix the converted drc markers (width, spacing, enclosure, area, minstep, etc). The rule map file should be a txt file with 3 columns: <pre>Rule_name error_type layer_name</pre> Below is an example: <pre>M1.W_4.5 width metall M1.A_0.048 minhole metall M1.M_1 minstep metall</pre>
<code>-type {Assura Calibre PVS Hercules ICV cdn_litho CDNCMP inShapeLitho CalibreLitho DRV ClockTran CLP VerifyPower}</code>	

	Specifies the file type. The following file types contain violation markers: • Assura - For Assura violations • Calibre - For Calibre violations • PVS - For PVS violations • Hercules - For Hercules violations • ICV - For ICValidator report violations • CDNCMP - For Cadence CMP Predictor (CCP) violations • DRV - For transition violations (reportTranViolation) • ClockTran, CLP, and VerifyPower - For low power violations The following file types contain hotspot markers, which are used to identify areas susceptible to lithography problems: • cdn_litho (LPA as well as NanoRoute litho HIF) • inShapeLitho • CalibreLitho
<code>-x_offset value</code>	Specifies the X offset. When you specify the X and Y offsets, Violation Browser displays the violations at the correct coordinates after accounting for the offsets.
<code>-y_offset value</code>	Specifies the Y offset, which Violation Browser takes into account to displays violations at the correct coordinates.

Examples

- The following command loads a CDN Litho marker file named `LPA.hif`:

```
read_markers -type cdn_litho -x_offset 0.05 -y_offset 0.05 in_file LPA.hif
```
- The following command loads a NanoRoute litho repair file named `NR.hif`:

```
read_markers -type cdn_litho in_file NR.hif
```

Related Commands

[report_markers](#)

report_markers

```
report_markers
[-help]
[-all]
[-ac_limit]
[-connectivity]
[-density]
[-geometry]
[-max_error_per_type integer]
[-no_false_marker]
[-overlap]
[-process_antenna]
[-short]
[-area {x1 y1 x2 y2}]
[-report filename]
[-filter filterString]
[-filter_mode {AND | OR | NOT}]
[-search_description]
```

Reports violations flagged by the verification commands. The report file and violation browser list the violations in the same order.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>report_markers</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man report_markers</code>
-ac_limit	Reports AC limit violations.
-all	Reports all violations.
-area {x1 y1 x2 y2}	Specifies the coordinates of the area for which to report violations. For example, <code>report_markers -area {0 0 100 100}</code> .
-connectivity	Reports connectivity violations.
-density	Reports metal density violations.

<code>-filter</code> <i>filterString</i>	Specifies a text string in the violation message (in the bottom portion of the Violation Browser). When you specify a text string, the Violation Browser searches the message of each violation and displays only the violations whose messages match the search conditions. To specify a list of strings, separate each string with a space. To specify a literal string with space in it, enclose the string in double quotation marks. For example, you can specify strings such as the following: • METAL5 • (600, 500) • METAL3 (700, 400) • "Pin of Net"
<code>-filter_mode {AND OR NOT}</code>	
	Specifies the condition for searching multiple strings in the violation browser. You cannot filter complex expressions because the AND, OR, and NOT parameters are mutually exclusive. • The <code>AND</code> and <code>OR</code> conditions work on single strings or multiple strings. • The <code>NOT</code> condition works only on a single string.
<code>-geometry</code>	Reports geometry violations.
<code>-max_error_per_type</code> <i>integer</i>	
	Specifies the error marker number limit for each type of error. Specifies a limit for the number of violations parsed for each violation type. For example, if you set <code>report_markers -max_error_per_type 500</code>, the Violation Browser parses and displays only 500 markers per error type in the report. Use this parameter if you are loading a large DRC file with millions of violations to prevent the database from becoming slow while loading the file and to limit the number of violations you review in the browser. By default, the Violation Browser displays all markers in the report.
<code>-no_false_marker</code>	Prohibits Tempus from displaying false violations.
<code>-overlap</code>	Reports overlap violations.
<code>-process_antenna</code>	Reports process antenna violations.
<code>-report</code> <i>filename</i>	Specifies the report file for the violation information. <i>Type:</i> String

- search_description	Searches the description field for each marker in addition to the table entries.
-short	Reports short violations.

Examples

The following command reports all violations whose marker title contains `METAL3`:

```
report_markers -all -filter METAL3
```

The following command reports geometry violations whose marker title contains `METAL3` or `tdsp`:

```
report_markers -geometry -filter {METAL3 tdsp} -filter_mode OR
```

The following command reports geometry violations whose marker title or marker description field contains `Min` and `0.24` and `METAL3`:

```
report_markers -geometry -filter {Min 0.24 METAL3} -filter_mode AND -search_description
```

gui_ctd_close

```
gui_ctd_close
[-help]
[-all | -id WindowIDName]
```

Closes open CTD windows. When no parameter is specified, the command closes the current active CTD window.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>gui_ctd_close</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man gui_ctd_close</code> .
-all	Closes all open CTD windows.
-id <i>WindowIDName</i>	Closes the CTD window with the specified window ID.

Examples

- The following command closes all CTD windows in the current session:

```
gui_ctd_close -all
```

- The following command closes the CTD window with the ID, `user_id2`:

```
gui_ctd_close -id user_id2
```

Related Commands

- `gui_ctd_open`
- `gui_ctd_highlight`
- `gui_ctd_zoom`

gui_ctd_get_title

```
gui_ctd_get_title  
[-help]  
[-all | -id WindowIDName]
```

Retrieves the titles of the CTD windows. If no parameters are specified, the command retrieves the title of the current active CTD window.

Note: Before using this command, ensure that a CTD window is open. You can open a CTD window using the `gui_open_ctd` command.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>gui_ctd_get_title</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man gui_ctd_get_title</code> .
-all	Retrieves the IDs of all CTD windows.
-id <i>WindowIDName</i>	Retrieves the title of the CTD window with the specified ID.

Examples

- The following command retrieves the titles of all CTD windows in the current session:

```
gui_ctd_get_title -all  
  
{user_id1 : Clock Tree Debugger : title1} {user_id2 : Clock Tree Debugger : title2} {user_id3 :  
Clock Tree Debugger : title3}
```

- The following command retrieves the title of the CTD window with the ID, `user_id2`:

```
gui_ctd_get_title -id user_id2  
  
user_id2 : Clock Tree Debugger : title2
```

where, `user_id2` is the window ID, Clock Tree Debugger is the window type, and `title2` is the mapping title for this window.

Related Commands

- `gui_ctd_set_title`
- `gui_ctd_get_window_id`

gui_ctd_get_window_id

```
gui_ctd_get_window_id  
[-help]  
[-all]  
[-detail]
```

Retrieves the IDs of the CTD windows. If no parameters are specified, the command retrieves the window ID of the current active CTD window. For example, if you create a window with the ID, `user_id`, and then run this command without specifying any parameters, the software displays the following information:

```
gui_open_ctd -title my_title -id user_id  
gui_ctd_get_window_id  
user_id
```

Note: Before using this command, ensure that a CTD window is open. You can open a CTD window using the `gui_open_ctd` command.

Parameters

- help	Outputs a brief description that includes type and default information for each <code>gui_ctd_get_window_id</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man gui_ctd_get_window_id</code> .
-all	Retrieves the IDs of all CTD windows.
-detail	Retrieves the IDs of CTD windows, with a mapping to their titles.

Examples

- The following command retrieves the ID of all CTD windows in the current session:

```
gui_ctd_get_window_id -all  
user_id1 user_id2 user_id3
```

- The following command retrieves the IDs of CTD windows, with a mapping of their titles:

```
gui_ctd_get_window_id -detail  
user_id2 : Clock Tree Debugger : title2
```

where, `user_id2` is the window ID, `Clock Tree Debugger` is the window type, and `title2` is the mapping title for this window.

Related Commands

- `gui_ctd_get_title`
- `gui_ctd_set_title`

gui_ctd_highlight

```
gui_ctd_highlight  
[-help]  
[-color colorname]  
[-from rootclock]  
[-index colorindex]  
[-out_file fileName]  
[-to sink | -through instancename]
```

Highlights the clock tree path from the clock root to the pin or from one pin to the other if the two pins are on the same path using the specified color or color index. The highlighted clock tree path can be viewed in the Clock Tree Viewer of the CCOpt Clock Tree Debugger (CTD). You can also use the Highlight Clock Path option in the context menu of the CTD to highlight the complete clock tree path of a selected pin to the clock root.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>gui_ctd_highlight</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man gui_ctd_highlight</code> .																														
<code>-color</code> <i>colorname</i>	Specifies the color to be used for highlighting the clock tree path that is being traced. <i>Default:</i> red																														
<code>-from</code> <i>clockroot</i>	Specifies the starting point of the highlight. If this parameter is not specified, the starting point of the highlight is the clock root of the specified sink.																														
<code>-index</code> <i>colorindex</i>	Specifies the range of colors that can be used to highlight the clock tree path. Minimum is 1 and maximum is 32. The range corresponds to the colors in the color picker provided in the <i>Highlight Clock Path</i> option in the context menu of the Clock Tree Viewer. The number 1 means red, 2 means blue, and so on. An example is shown in the image below. <i>Default:</i> 1 or red.																														
<code>-out_file</code> <i>fileName</i>	Specifies the name of the file in which the physical information for each instance and net in the clock path being traced will be dumped. The following information is saved in the file: <table><tr><td>Name</td><td>Cell</td><td>Status</td><td>Location</td><td>Wire Length</td></tr><tr><td>CLK_ROOT</td><td>PAD</td><td>Fixed</td><td>(20,40)</td><td></td></tr><tr><td>net_1</td><td></td><td>don't_touch</td><td></td><td>12.5</td></tr><tr><td>Buf_1</td><td>BUFX1</td><td>placed</td><td>(100,180)</td><td></td></tr><tr><td>net_2</td><td></td><td></td><td></td><td>35</td></tr><tr><td>Buf_2</td><td>BUFX2</td><td>placed</td><td>(200, 120)</td><td></td></tr></table> <i>Name</i> is the instance name or the net name <i>Cell</i> is the instance cell type. This information is only for instances <i>Status</i> is the place status for an instance and constrain status for a net. For dont_touch nets, the status is 'dont_touch', otherwise this column is left blank <i>Location</i> is the physical location of the instance or the coordinate of that instance <i>Wire Length</i> is only for nets	Name	Cell	Status	Location	Wire Length	CLK_ROOT	PAD	Fixed	(20,40)		net_1		don't_touch		12.5	Buf_1	BUFX1	placed	(100,180)		net_2				35	Buf_2	BUFX2	placed	(200, 120)	
Name	Cell	Status	Location	Wire Length																											
CLK_ROOT	PAD	Fixed	(20,40)																												
net_1		don't_touch		12.5																											
Buf_1	BUFX1	placed	(100,180)																												
net_2				35																											
Buf_2	BUFX2	placed	(200, 120)																												
<code>-through</code> <i>instancename</i>	Specifies the instance or pin through which the path should be traced.																														
<code>-to</code> <i>sink</i>	Specifies the end point of the highlighted path.																														

The image below shows the clock tree path highlighted in green, which corresponds to the color index 3. It also shows the color picker with the range of colors included in the color index.

Example

The following command highlights the clock tree path for the specified pin, `ff1`, from the clock root in green color:

- `gui_ctd_highlight -to ff1 -index 3`

The CTD shows the following:

- The following command highlights the path between two sinks that are on the same path, in green color:

```
gui_ctd_highlight -to ff1 -from u1 -index 3
```

Related Commands

- `gui_ctd_open`
- `gui_ctd_close`

gui_ctd_open

```
gui_ctd_open
[-help]
[-id windowIDName]
[-include_reporting_only_skew_groups]
[-title CTDWindowID]
[-unit_delay]
```

Opens a Clock Tree Debugger (CTD) window with the user-defined window ID and title.

When run without specifying the ID and title, the command opens a CTD window with a system default window title. By default, the window title is the name of the current analysis corner, which shows in the CTD window. For example, "Clock Tree Debugger - func_rcbest".

By default, all CTD windows have their unique window ID. The mechanism of the default window ID is ctdMainWin_1, ctdMainWin_2, ctdMainWin_3....and so on. So, by default, the window ID of a new opened Clock Tree Debugger window is ctdMainWin_1.

The information in the title comprises the following:

```
Session title: Window type: Window title
```

where,

Window type is always “Clock Tree Debugger”.

If the user-specified session title is “my_test.tcl”, and the default primary analysis corner is “primary_corner”, then with gui_ctd_open, the total set of the window title line will be:

```
my_test.tcl : Clock Tree Debugger : primary_corner
```

Parameters

-help	Outputs a brief description that includes type and default inforr each gui_ctd_open parameter. For a detailed description of th its parameters, use the man command:man gui_ctd_open.
-id windowIDName	Opens a Clock Tree Debugger window with a user-specified w the window IDs will be ctdMainWin_0, or ctdMainWin_1, and so
-include_reporting_only_skew_groups	When this parameter is specified, the GUI will include the repo By default, this setting if off, which means the reporting-only sk omitted from the CTD. Note: Once the CTD is started, it will not be possible to add or only skew groups from those that are displayed. You will need window specifying the new skew group filtering that is requirec

<code>-title CTDWindowID</code>	Specifies the user-defined title for the CTD window. Open a CTD window with a user specified title. For example, if you specify <code>my_title</code>, when session title is <code>my_test.tcl</code> and the primary analysis is <code>primary_corner</code>, then the total set of the window title line will be <pre>my_test.tcl : Clock Tree Debugger : my_title</pre> Note: The window's ID if not specified using the <code>-id</code> parameter is the window ID. To view the default window ID, use the <code>gui_ctd_get_window</code>
<code>-unit_delay</code>	Opens the CTD window in unit delay mode. The unit delay lets you view clock tree objects easily. This is useful when you have large deep level trees. When debugging clock trees, you can use this view to see how trees are balanced by looking at the depth of the clock trees. A unit delay mode can also be enabled using the <i>Unit delay</i> submenu in the CTD but this is only valid after running clock tree synthesis, and then invoke timing calculation and extraction, which are time consuming operations. The <code>-unit_delay</code> parameter to open the CTD in unit delay mode even if the design is not synthesized without performing CTS. When the CTD is opened in this mode, the following options in the CTD are disabled: <i>Visibility</i> menu: • Timing windows • Delays • Unit delay <i>Color by</i> menu and the <i>Control</i> panel: • Transition time • Total net cap • Max cap violation • Skew • Setup slack • Hold slack • Timing windows This is shown in below image.

Examples

- The following command creates a CTD window ID with the user-specified name, `my_test`:

```
gui_ctd_open -id my_test
```

When you use the `get_ctd_win_id` command to list all window IDs, you get the above window ID in the list:

```
gui_ctd_get_window_id -all
```

```
ctdMain_0 my_test
```

- The following command creates a CTD window ID, `my_test` and CTD window title of `myTest.tcl`:

```
gui_ctd_open -title myTest.tcl
```

When you use the `-detail` parameter of the `gui_ctd_get_window_id` command, the following information is returned:

```
gui_ctd_get_window_id -detail
```

```
ctdMain_1 "Clock Tree Debugger - func_rcbest"
```

where, `ctdMain_01` is the default window ID, window type is Clock Tree Debugger, and `func_rcbest` is the name of the current analysis corner.

Related Commands

- `gui_ctd_close`
- `gui_ctd_highlight`
- `gui_ctd_zoom`

gui_ctd_write_view

```
gui_ctd_write_view  
[-help]  
-file fileName  
[-id windowID]  
[-legend_on]  
[-type {PNG | GIF}]
```

Saves the current snapshot of the clock tree viewer into a file.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>gui_ctd_write_view</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man gui_ctd_write_view</code> .
-file <i>fileName</i>	Specifies the name of the file where you want to dump the display image. This parameter is required.
- id <i>windowIDName</i>	Specifies the window ID whose display is to be saved. The default value is the returned value of command <code>gui_ctd_get_window_id</code> .
-legend_on	Saves the whole window including the panels that are open.
-type {PNG GIF}	Specifies whether the format of the image should be Gif or PNG.

Example

The following command saves the view snapshot in the `snapshot1.png` file.

```
gui_ctd_write_view -file snapshot1 -type PNG
```

Related Commands

- `gui_ctd_close`
- `gui_ctd_get_window_id`
- `gui_ctd_highlight`

- `gui_ctd_write_histogram`

gui_ctd_set_title

```
gui_ctd_set_title
[-help]
title
[-id WindowIDName]
```

Specifies the title of the CTD window. By default, this command is used to set the title of the current active CTD window either if a unique ID has not been specified for this window or if you want to change the existing window ID.

You can also set the window title from the context menu of the Clock Tree Viewer in the CTD. Click Set Window Title, type the title for the CTD session, and press enter. The new title appears in the top bar of the CTD. This is shown in below image.

Parameters

- help	Outputs a brief description that includes type and default information for each <code>gui_ctd_set_title</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man gui_ctd_set_title</code> .
-id WindowIDName	
	Specifies the ID of the window whose title is to be set. If there are several CTD windows open in the current session, with window IDs, <code>user_id1</code> , <code>user_id3</code> , <code>user_id3</code> , and so on, with corresponding window titles, <code>title1</code> , <code>title2</code> , <code>title3</code> , and so on, then the following command will only change the <code>title1</code> of window with ID, <code>user_id1</code> , to <code>my_new_title</code> . <code>gui_ctd_set_title my_new_title -id user_id1</code>
title	Specifies the title to be given to the specified window. This parameter is required.

Examples

- The following command sets the window title of the current CTD window, `my_title`, to `my_new_title`:

```
gui_ctd_set_title my_new_title
```

The active CTD window title will be changed from:

```
my_test.tcl : Clock Tree Debugger : my_title
```

to:

```
my_test.tcl : Clock Tree Debugger : my_new_title
```

- The following command retrieves the window IDs of CTD windows, with a mapping of their window titles:

```
gui_ctd_get_window_id -detail
```

```
user_id2 : Clock Tree Debugger : title2
```

where, `user_id2` is the window ID, Clock Tree Debugger is the window type, and `title2` is the mapping title for this window.

Related Commands

- `gui_ctd_get_title`
- `gui_ctd_get_window_id`

gui_ctd_show_skew_group

```
gui_ctd_show_skew_group  
[-help]  
[-id window_id_name]  
-skew_group skew_group_name
```

Shows the specified skew group in the CTD window.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>ctd_show_skew_group</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man ctd_show_skew_group</code> .
-id <i>window_id_name</i>	Specifies the CTD window ID. The default value is the ID of the current active CTD window.
-skew_group <i>skew_group_name</i>	Specifies the name of the skew group. This is a required parameter.

Example

Use the following command to show the specified skew group in the CTD window:

```
gui_ctd_show_skew_group -skew_group m_rcc_clk/PM_HL_FUNC
```

Related Commands

- `gui_ctd_close`
- `gui_ctd_get_title`
- `gui_ctd_set_title`
- `gui_ctd_get_window_id`
- `gui_ctd_highlight`

gui_ctd_write_histogram

```
gui_ctd_write_histogram  
[-help]  
[-csv]  
-file fileName  
[-id windowID]
```

Saves the CTD histogram to a file. By default, the file type is PNG. You can also specify that the file be saved in the CSV format.

Before using this command to save the histogram view, first open and configure the histogram in the GUI, including skew group and delay corners.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>gui_ctd_write_histogram</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man gui_ctd_write_histogram.</code>
-csv	Saves the histogram in CSV format. This parameter is optional. By default, the histogram is saved as a PNG file.
-file <i>fileName</i>	Specifies the name of the file where you want to save the histogram. This parameter is required.
- id <i>windowIDName</i>	Specifies the ID of the active CTD window. The default value is the ID of the current active window.

Example

The following command saves the histogram in the `histogram1.csv` file.

```
gui_ctd_write_histogram -file histogram1 -csv
```

Related Commands

- `gui_ctd_close`
- `gui_ctd_highlight`
- `gui_ctd_zoom`
- `gui_ctd_open`
- `gui_ctd_write_view`

gui_ctd_zoom

```
gui_ctd_zoom  
[-help]  
[-id string]  
[-in | -out | -selected]  
[-vertical_range {ymin ymax}]
```

Zooms into or out of the CTD window.

Parameters

-help	Prints a brief description of the <code>gui_ctd_zoom</code> command. For a detailed description of the command, use the <code>man</code> command: <code>man gui_ctd_zoom</code> .
-id <i>string</i>	Specifies the window ID of the CTD window in which to zoom in or zoom out.
-in	Zoom into the CTD window.
-out	Zoom out of the CTD window.
-selected	Zoom to enclose all selected objects.
-vertical_range { <i>ymin ymax</i> }	Zoom to a specific vertical latency range. If CTD is in timing-based mode, the window will zoom to the clock tree parts where latency is between <i>ymin</i> and <i>ymax</i>, and the unit is the same as global timing unit. If CTD is in unit delay mode, the window will zoom to the clock tree parts where stage depth is between <i>ymin</i> and <i>ymax</i>. For example, if CTD is in timing-based mode, then the command, <code>gui_ctd_zoom -vertical_range {0 1.5}</code> will zoom to the clock tree parts where latency is between 0 and 1.5, the unit is the same as <code>get_time_unit</code>. If CTD is in unit delay mode, then the command, <code>gui_ctd_zoom -vertical_range {0 1.5}</code> will zoom to the clock tree parts where stage depth is between 0 and 1.5. Note: The window only zooms in vertical.

Examples

Use the following command to zoom in to the CTD:

```
gui_ctd_zoom -in
```

Select an instance and use the following command to zoom into the selected instance:

```
gui_ctd_zoom -selected
```

Related Commands

Delay Calculation Commands and Attributes

- [create_aging_stress_profile](#)
- [delaycal Category Attributes](#)
- [get_aging_activity](#)
- [get_aging_analysis_mode](#)
- [report_aging_activity](#)
- [report_aging_stress_profile](#)
- [report_delay_calculation](#)
- [set_aging_activity](#)
- [set_aging_analysis_mode](#)
- [write_exclude_nets](#)
- [write_set_load](#)

create_aging_stress_profile

```
create_aging_stress_profile  
[-help]  
[-views {views}]  
[-early]  
[-late]  
[-bti_pmos_scale <scale_val>]  
[-bti_nmos_scale <scale_val>]  
[-hci_pmos_scale <scale_val>]  
[-hci_pmos_scale <scale_val>]  
{segment1 segment2 ...}
```

Defines the stress profile for aging-aware STA. The profile contains stress duration, stress temperature, and stress voltage per power rail.

You can apply different stress profiles for different views, and different stress profiles for early/late timing.

Parameters

-help	Prints out the command usage.
-early	Specifies the early timing path.
-late	Specifies the late timing path.
-bti_pmos_scale <scale_val>	Specifies the BTI PMOS scale value.
-bti_nmos_scale <scale_val>	Specifies the BTI NMOS scale value.
-hci_pmos_scale <scale_val>	Specifies the HCI PMOS scale value.
-hci_nmos_scale <scale_val>	Specifies the BTI NMOS scale value.
{segment1 segment2 ...}	Specifies the stress duration, voltages, and temperature information. Here the <i>segment1</i> , <i>segment2</i> ... specifies the stress duration, voltage, and temperature information, for example, {{duration <float>}}[{{voltage {<pg_net1> <float> <pg_net2> <float> ...}}} [{temperature <float>}}] }
-views {views}	Specifies the views for which stress profile is to be created.

Examples

- The following command specifies a multi-segment stress profile consisting of stress duration, stress temperature, and stress voltage for view “view1”.

```
tempus > create_aging_stress_profile -view view1 \
{{{ duration 3} {voltage {VDD 0.8 VSS 0.0}}{temperature 125}} \
{{duration 7} {voltage {VDD 0.45 VSS 0.0}}{temperature 25}}}
```

You can specify initial 3 years of aging with one stress condition and rest of the 7 years with different stress conditions - for a total 10 years of aging:

- The following command specifies the stress profile along with BTI and HCI scales for PMOS and NMOS.

```
tempus > create_aging_stress_profile { { { duration 10 } {voltage {VDD 1.05 VPW 0.0 VNW  
\
1.05 VSS 0.0 }} {temperature 125 } } } -bti_pmos_scale 0.5 -bti_nmos_scale 0.5 \
-hci_pmos_scale 1 -hci_nmos_scale 1
```

delaycal Category Attributes

The root attributes in the "delaycal" category are:

- `delaycal_accuracy_level`
- `delaycal_accurate_receiver_out_load`
- `delaycal_advanced_pin_cap_mode`
- `delaycal_combine_mmmc`
- `delaycal_disable_randomcell_in_socv`
- `delaycal_enable_accurate_lle_analysis`
- `delaycal_degrade_slew_on_early_nets`
- `delaycal_default_net_delay`
- `delaycal_default_net_load`
- `delaycal_disable_positive_slack_shift`
- `delaycal_enable_corner_based_beol`
- `delaycal_enable_high_fanout`
- `delaycal_enable_input_slew_sensitivity_on_constraint`
- `delaycal_enable_quiet_receivers_for_hold`
- `delaycal_enable_si`
- `delaycal_enable_separate_wire_var_sigma_multiplier`
- `delaycal_enable_wire_load_model`
- `delaycal_equivalent_waveform_model`
- `delaycal_equivalent_waveform_type`
- `delaycal_equivalent_waveform_model_for_timing_check`
- `delaycal_library_interpolation_mode`
- `delaycal_honor_slew_propagate_constraint`
- `delaycal_input_transition_delay`
- `delaycal_irdrop_data_type`
- `delaycal_early_irdrop_data_type`
- `delaycal_late_irdrop_data_type`
- `delaycal_irdrop_window_based`

- `delaycal_report_out_bound`
- `delaycal_separate_params_for_via`
- `delaycal_slew_out_bound_limit_high`
- `delaycal_slew_out_bound_limit_low`
- `delaycal_skip_slew_merge_from_disabled_path`
- `delaycal_socv_accuracy_mode`
- `delaycal_socv_lvf_mode`
- `delaycal_socv_machine_learning_level`
- `delaycal_socv_use_lvf_tables`
- `delaycal_support_output_pin_cap`
- `delaycal_timing_create_clock_use_ideal_slew`
- `delaycal_use_default_delay_limit`
- `delaycal_via_corner_sigma_multiplier`
- `delaycal_via_correlation_type`
- `delaycal_via_reset`
- `delaycal_wire_corner_sigma_multiplier`
- `delaycal_wire_correlation_type`
- `delaycal_wire_layer_avg_rpt`
- `delaycal_wire_rc_correlation_factor`
- `delaycal_wire_reset`
- `delaycal_wire_use_nsigma_coupling_capacitance`
- `delaycal_wire_use_nsigma_slew_for_timing_check`
- `delaycal_wire_var_reporting_sigma_multiplier`
- `delaycal_wire_variation_correlation_mode`
- `delaycal_wire_variation_rc_correlation`
- `delaycal_wire_wire_cell_variation_correlation`

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `power` category, use the following command:

```
get_db -category delaycal
```

For delay calculation reports, use the following command:

- `report_delay_calculation`

delaycal_accuracy_level

```
delaycal_accuracy_level level
```

Default: 3

Data_type: Integer

Sets the accuracy level for delay calculations.

You can use this attribute to enable new enhancements for different process nodes, without using the `design_process_node` attribute.

This setting replaces earlier use models where the `set_design_mode -process` parameter was used to enable delay calculation accuracy settings.

The following commands show mapping of old and new options to use for specific nodes:

```
set_design_mode -process 16 == delaycal_accuracy_level 0  
set_design_mode -process 10 == delaycal_accuracy_level 1  
set_design_mode -process 7 == delaycal_accuracy_level 2  
set_design_mode -process 5 == delaycal_accuracy_level 3
```

delaycal_accurate_receiver_out_load

```
delaycal_accurate_receiver_out_load {true | false}
```

Default: true

Data_type: Boolean

When set to `true`, Tempus uses distributed interconnect model as receiver output load to compute accurate miller effect.

In this mode, Tempus uses a reduced interconnect model for receivers instead of lumped capacitance as the receiver load. This improves computation of the back miller effect and the delay accuracy.

When set to `false`, the software uses lumped capacitance as the receiver load.

delaycal_advanced_pin_cap_mode

delaycal_advanced_pin_cap_mode {0 | 1 | 2}

Default: 2

Data_type: Enum

Simulates the current stage and receiver stages together, such that the back miller effect is modeled dynamically.

- 0: Receiver current sources are computed using ECSM/CCS capacitance tables with the estimated input slew.
- 1: Receivers are no longer modeled as simple non-linear current source models. This results in increasing the delay calculation accuracy significantly as the modeling back miller effect improves.
- 2: Uses advanced simulation-based approach to model the receiver back miller effect.

delaycal_combine_mmmc

delaycal_combine_mmmc {none | early_late | early_late_corner}

Default: early_late

Data_type: Enum

Specifies whether delay calculation runs are to be combined for delay calculation simulations. This attribute provides user control for improving the runtime for all the analysis types by combining runs for early and late simulations into a single simulation. The views with common delay corners may also be combined into a single delay calculation simulation for added runtime improvement. You can use the following options:

- none: Does not combine any delay calculation runs. Individual delay calculation simulations are performed for early and late for example, which will result in significant CPU performance degradation due to the increased number of simulation runs performed.
- early_late: Combines early and late simulations of a single corner into one delay calculation simulation and will improve CPU performance by avoiding unnecessary delay calculation simulations.
- early_late_corner: Combines early / late simulations of a single corner, like with the early_late setting, but also combines views with common delay corners into one single delay calculation simulation. For example, the software will combine views having different `set_case_analysis` statements in one single simulation. This can result in significant improvement in CPU performance by avoiding unnecessary delay calculation simulations.

delaycal_disable_randomcell_in_socv

```
delaycal_disable_randomcell_in_socv {true | false}
```

Default: false

Data_type: Boolean

Disables random cell sensitivity in SOCV mode.

delaycal_enable_accurate_lle_analysis

```
delaycal_enable_accurate_lle_analysis {true | false}
```

Default: false

Data_type: Boolean

Enables accurate LLE analysis.

delaycal_degrade_slew_on_early_nets

```
delaycal_degrade_slew_on_early_nets {true | false}
```

Default: true

Data_type: Boolean

Controls whether slews in early path delay calculation are degraded as they pass across the interconnect from driver to receiver. You can specify a value of false to turn off interconnect slew degradation for early paths and have the driver slews copied to the receivers. Early path delay calculation affects all Hold paths in best-case/worst-case analysis mode, capture clock paths in on-chip variation Setup analysis, and clock launch and data paths in on-chip variation Hold analysis.

delaycal_default_net_delay

```
delaycal_default_net_delay delay_value
```

Default: 1000ps

Data_type: String

Sets the default net delay for delay calculation. The software uses this default value for nets that exceed 1,000 terminals. Delay calculation is performed for nets with fewer than 1,000 terminals.

delaycal_default_net_load

```
delaycal_default_net_load load_value
```

Default: 0.5pF

Data_type: String

Sets the default net load for delay calculation. You can use this attribute to specify the default net load value that is used for nets that exceed 1,000 terminals.

delaycal_disable_positive_slack_shift

```
delaycal_disable_positive_slack_shift {true | false}
```

Default: false

Data_type: Boolean

Disables positive slack shift caused by back end-of-line (BEOL) variation.

delaycal_enable_corner_based_beol

```
delaycal_enable_corner_based_beol {true | false}
```

Default: false

Data_type: Boolean

Enables anchor corner-based BEOL (back end-of-line) analysis.

delaycal_enable_high_fanout

```
delaycal_enable_high_fanout {true | false}
```

Default: false

Data_type: Boolean

When this attribute is set to `true`, the default net delay will be annotated on high fanout nets. A net will be treated as a high fanout net when the fanout is more than the limit specified using the `delaycal_use_default_delay_limit` attribute. The default value of this attribute is 1000 fanouts. The default net delay is also specified using this attribute. The default net delay is 1 ns. The cell delay will use the lumped capacitance that is specified using the `delaycal_default_net_load` attribute for table lookup. The default net load is 0.5pF. The driver slew will use the default value of 0ps, which can be changed by using the `delaycal_input_transition_delay` attributes and there will be no slew degradation along the interconnect.

delaycal_enable_input_slew_sensitivity_on_constraint

```
delaycal_enable_input_slew_sensitivity_on_constraint {true | false}
```

Default: `true`

Data_type: Boolean

Enables the input slew sensitivity on constraints.

When set to `true`, the input slew sensitivities at constrained and related pins will be considered by timing check sigma calculation.

When set to `false`, the timing check arc is derived based on the nominal or mean slews only.

delaycal_enable_quiet_receivers_for_hold

```
delaycal_enable_quiet_receivers_for_hold {true | false}
```

Default: `false`

Data_type: Boolean

Forces some receivers to be static (“quiet”).

When set to `true`, the software assumes that the receivers are not switching - to compute the worst-case delays for early analysis. This yields more conservative early delays.

When set to `false`, the software assumes that the receivers may switch.

delaycal_enable_si

```
delaycal_enable_si {true | false}
```

Default: `false`

Data_type: Boolean

Enables SI-Aware delay calculation that also includes cross-talk induced delays.

Note: The SI-Aware delay calculation requires the design to be in Multi-Mode, Multi-Corner (MMMC) Mode and the analysis type to be set to on-chip variations.

delaycal_enable_separate_wire_var_sigma_multiplier

```
delaycal_enable_separate_wire_var_sigma_multiplier {true | false}
```

Default: `false`

Data_type: Boolean

Allows separate reporting sigma multiplier for wire variations.

delaycal_enable_wire_load_model

delaycal_enable_wire_load_model {0 | 1}

Default: 1

Data_type: Integer

Enables support of Liberty wire-load models and related SDC commands.

delaycal_equivalent_waveform_model

delaycal_equivalent_waveform_model {none | no_propagation | propagation}

Default: none

Data_type: Enum

Specifies the equivalent waveform model to be used.

delaycal_equivalent_waveform_type

delaycal_equivalent_waveform_type {moments | simulation}

Default: simulation

Data_type: Enum

Specifies the equivalent waveform model (EWM) to be used:

The options are described below:

- **moments:** Enables moment-based equivalent waveform model.
- **simulation:** Enables simulation-based equivalent waveform model. The simulation-based EWM is required for predicting delay in noisy waveforms.

It is recommended to use simulation-based EWM as it is more accurate than moment-based EWM.

delaycal_equivalent_waveform_model_for_timing_check

delaycal_equivalent_waveform_model_for_timing_check {true | false}

Default: false

Data_type: Boolean

Models the waveform distortion effect for timing check value look ups at both the data and clock pins.

The model uses simulations to convert the distorted waveforms into equivalent waveforms (pre-driver waveforms in the libraries) by matching the pin CCB output waveforms. This feature requires the CCSN

library.

delaycal_library_interpolation_mode

```
delaycal_library_interpolation_mode {linear | non_linear}
```

Default: linear

Data_type: Enum

Controls library scaling mode - `linear` or `non_linear` - for the interpolation flow.

delaycal_honor_slew_propagate_constraint

```
delaycal_honor_slew_propagate_constraint {true | false}
```

Default: true

Data_type: Boolean

Determines whether to propagate the slew from the disabled timing arcs to the output pin.

When set to `false`, the slew from the disabled timing arc affects the delay of the next stage. Setting this attribute to false results in more accurate slew computation for the disabled timing arcs but can take longer run time.

When set to `true`, the timing constraints defined using commands such as `set_disable_timing` and `set_case_analysis` impact the slew propagation, and the slew from the disabled timing arcs is not propagated.

delaycal_input_transition_delay

```
delaycal_input_transition_delay " "
```

Default: 4ps

Data_type: String

Sets the default input transition delays and the ideal clock transition time for delay calculation. The software uses this default transition time for nets that exceed 1,000 terminals.

It is mandatory to specify time units for this command. Valid time units are ps, ns, etc.

In addition, the default input transition value is applied to those pins to which the slew was not propagated. For example:

- Tiehi or tielo pins
- Macro output pins, which do not have a related input pin

A macro output pin, which has a related input pin will most likely have slew propagation from the related input pin to the output pin.

- Macro output pins for which all the timing arcs are disabled
- Input ports without a user-specified transition value

delaycal_irdrop_data_type

`delaycal_irdrop_data_type {best_average | worst | best | average | worst_average}`

Default: `worst`

Data_type: Enum

Allows you to set early/late IR drop EIV values for different EIV voltages.

delaycal_early_irdrop_data_type

`delaycal_early_irdrop_data_type {best_average | worst | best | average | worst_average}`

Default: `worst`

Data_type: Enum

Allows you to set early IR drop EIV values for different EIV voltages.

delaycal_late_irdrop_data_type

`delaycal_late_irdrop_data_type {best_average | worst | best | average | worst_average}`

Default: `worst`

Data_type: Enum

Allows you to set late IR drop EIV values for different EIV voltages.

delaycal_irdrop_window_based

`delaycal_irdrop_window_based {none | late | early | both}`

Default: `both`

Data_type: Enum

Searches window-based EIV values from the EIV database.

delaycal_report_out_bound

delaycal_report_out_bound {true | false}

Default: false

Data_type: Boolean

Generates a report that contains a list of index values (input transition) in the delay tables that are beyond the index range. The index values detected by this attribute can cause inaccurate delay values to be calculated. The report generated by this attribute can be used for debugging.

When this attribute is set to `true`, the extrapolation information will be dumped into the following two files:

- <design-name>.dc.outbound.slew.early.<view-name>.txt
- <design-name>.dc.outbound.slew.late.<view-name>.txt

The software writes a warning message in the log files noting that there are input transition values that are out of the index range of the timing table. The warning message also provides the file name for viewing the detail report.

delaycal_separate_params_for_via

delaycal_separate_params_for_via {true | false}

Default: false

Data_type: Boolean

When set to `true`, the software creates separate parameters for via variation.

delaycal_slew_out_bound_limit_high

delaycal_slew_out_bound_limit_high double

Default: 3.40282e+38

Data_type: Double

Limits the maximum slew used in the analysis to the specified value times max characterized slew in a library.

delaycal_slew_out_bound_limit_low

delaycal_slew_out_bound_limit_low double

Default: 0.5

Data_type: Double

Limits the minimum slew used in the analysis to the specified value times min characterized slew in a library.

delaycal_skip_slew_merge_from_disabled_path

```
delaycal_skip_slew_merge_from_disabled_path {true | false}
```

Default: false

Data_type: Boolean

Avoids merging slews from unconstrained, segmented paths and black-box output pin.

When set to `true`, the software does not allow merging transitions from disabled paths.

delaycal_socv_accuracy_mode

```
delaycal_socv_accuracy_mode {low | medium | high | ultra}
```

Default: low

Data_type: Enum

Allows the ability to control levels of accuracy.

This attribute specifies level-based accuracy effort for delays and slews. You can use one of the following options:

- `low`: Ignores correlation between slews and delays.
- `medium`: Models correlation between immediate slew and delay.
- `high`: Considers skewness of non-gaussian distribution into account for computing quantiles. The skewness is local to one stage only.
- `ultra`: Considers skewness of non-gaussian distribution, and also propagates skewness to the next stage in PBA analysis.

delaycal_socv_lvf_mode

```
delaycal_socv_lvf_mode string
```

Default: moments

Data_type: Enum

Controls SOCV LVF analysis modes. You can specify `moments` or `early_late` option.

delaycal_socv_machine_learning_level

delaycal_socv_machine_learning_level {0 | 1 | 3}

Default: 0

Data_type: Integer

Enables the SOCV machine learning mode.

For accurate SOCV analysis, the Tempus software creates several statistical models, which are not available with standard LVF library, such as correlation between cells delay and output slew, the conversion of moments from late/early sigma tables, and effects of waveform distortion on sigma and mean shift.

You can specify one of the following options:

- 1: Enables several machine learning algorithms to generate such models internally.
- 3: Enabling this mode uses improved modeling of slew-delay correlation using advanced machine learning techniques. This option enables accurate quantile modeling, which involves quantile computation from mean, stddev and skewness values.

Note: The default setting of 0 is recommended for nodes 110, 40, 28, and 22nm. For other technology nodes, option 3 can be used. For this setting you must enable the ultra mode using – socv_accuracy_mode ultra option.

delaycal_socv_use_lvf_tables

delaycal_socv_use_lvf_tables string

Default: all

Data_type: String

Controls which type of variations – all, delay, slew, or constraint - are considered during analysis.

delaycal_support_output_pin_cap

delaycal_support_output_pin_cap {true | false}

Default: true

Data_type: Boolean

Includes the output pin capacitance when calculating delay values. When you specify false, the software excludes only the pin capacitance of the driver for which you are calculating the delay.

delaycal_timing_create_clock_use_ideal_slew

delaycal_timing_create_clock_use_ideal_slew {true | false}

Default: false

Data_type: Boolean

Enables the use of ideal slew at the inputs of the clock driver cells.

When set to `true`, the software detects created clocks, and uses zero input slew. Other slew values, including those set using `set_annotated_transition` command, will be ignored.

When set to `false`, the software honors `set_annotated_transition` command settings.

delaycal_use_default_delay_limit

delaycal_use_default_delay_limit value

Default: 1000

Data_type: Integer

Sets the pin number threshold for nets for delay calculation. Nets that have more than the specified number of pins are excluded from delay calculation, and use the default delay values instead.

Net default delay values are:

- Net delay: 1 ns
- Transition time: 0 ps
- Net load: 0.5 pF

Note: In post route stage, default delay calculation does not honor this attribute. Slews and delays are computed based on actual parasitics.

To change the default delay values, set the following attributes:

- `delaycal_default_net_delay`
- `delaycal_default_net_load`
- `delaycal_input_transition_delay`

delaycal_via_corner_sigma_multiplier

delaycal_via_corner_sigma_multiplier String

Default: " "

Data_type: string

Provides the scaling multiplier for corner scaling. This attribute allows you to specify per via sigma

multiplier and handles the advanced via variation scaling.

delaycal_via_correlation_type

`delaycal_via_correlation_type` *String*

Default: corner

Data_type: Enum

Specifies the inter-layer correlation values.

delaycal_via_reset

`delaycal_via_reset` {true | false}

Default: false

Data_type: Boolean

When set to `true`, the software resets the via variation modes to their default value.

delaycal_wire_corner_sigma_multiplier

`delaycal_wire_corner_sigma_multiplier` *string*

Default: " "

Data_type: string

Provides scaling multiplier for corner scaling.

delaycal_wire_correlation_type

`delaycal_wire_correlation_type` {statistical | binomial | corner | correlated}

Default: statistical

Data_type: Enum

Provides control to handle inter-layer correlation. The accepted values are - statistical, binomial, corner, and correlated.

delaycal_wire_layer_avg_rpt

`delaycal_wire_layer_avg_rpt` {true | false}

Default: false

Data_type: Boolean

Enables layer averaging reporting.

delaycal_wire_rc_correlation_factor

delaycal_wire_rc_correlation_factor *int*

Default: 1

Data_type: Integer

Allows same layer R and C correlation. The accepted values are 1 and -1.

delaycal_wire_reset

delaycal_wire_reset {true | false}

Default: false

Data_type: Boolean

Resets wire variation modes to the default value.

delaycal_wire_use_nsigma_coupling_capacitance

delaycal_wire_use_nsigma_coupling_capacitance {true | false}

Default: false

Data_type: Boolean

Allows to use mean and nSigma coupling capacitance.

delaycal_wire_use_nsigma_slew_for_timing_check

delaycal_wire_use_nsigma_slew_for_timing_check {true | false}

Default: false

Data_type: Boolean

Enables use of wire variation-aware slews for timing check lookup.

delaycal_wire_var_reporting_sigma_multiplier

delaycal_wire_var_reporting_sigma_multiplier *double*

Default: 0.0

Data_type: Double

Specifies deterministic sigma multiplier for reporting BEOL variations.

delaycal_wire_variation_correlation_mode

delaycal_wire_variation_correlation_mode {statistical | binomial}

Default: statistical

Data_type: Enum

Specifies wire variation inter-layer correlation. When set to `statistical`, all the layers are considered independent of each other.

delaycal_wire_variation_rc_correlation

delaycal_wire_variation_rc_correlation *double*

Default: 1.0

Data_type: Double

Specifies same layer R and C correlation for wire variation. When set to 1, the R and C sensitivities are considered as fully correlated.

delaycal_wire_wire_cell_variation_correlation

delaycal_wire_wire_cell_variation_correlation {true | false}

Default: false

Data_type: Boolean

Controls whether to RSS or add random cell variation and wire variation for arrivals and slack.

get_aging_activity

get_aging_activity

[-help]

-net <string>

[-views <string>]

Returns the current settings of the `set_aging_activity` command.

Parameters

<code>-help</code>	Prints out the command usage.
<code>-net <string></code>	Returns the net names.
<code>-views <string></code>	Returns a list of the specified views.

Related Commands

- `create_aging_stress_profile`
- `set_aging_activity`
- `report_aging_activity`
- `write_spice_deck`

Related Information

"[Aging-Aware STA Analysis](#)" chapter in the *Tempus Stylus User Guide*.

get_aging_analysis_mode

```
get_aging_analysis_mode
[-help]
[-activity_propagation_mode]
[-constraints]
[-disable_aging]
[-max_duty_cycle]
[-max_toggle_rate]
[-max_toggle_rate_limit <value>]
[-min_duty_cycle]
[-min_toggle_rate]
[-param_priority_sets]
[-recovery]
[-sequential_activity_propagation]
[-sequential_max_duty_cycle]
[-sequential_max_toggle_rate]
[-sequential_min_duty_cycle]
[-sequential_min_toggle_rate]
[-type]
[-use_fixed_duty_cycle]
[-views]
```

Returns the aging analysis related global variable settings and defaults - that have been made using the `set_aging_analysis_mode` command.

Parameters

Displays the following information about the specified `set_aging_analysis_mode` parameters in the Tempus log file and the Tempus console:

- Parameter name
- Current value
- Type (Boolean, string, and so on)
- Whether the current value was set by user

If you do not specify any parameters, the software displays information for all of the parameters.

Parameters

-help	Prints out the command usage.
-------	-------------------------------

<i>parameter_names</i>	Displays information for the specified parameters. You can specify one or more parameters. See set_aging_analysis_mode for descriptions of the parameters you can specify.
------------------------	--

Related Commands

- [set_aging_analysis_mode](#)
- `set_db timing_analysis_aging`
- [set_aging_activity](#)
- [create_aging_stress_profile](#)
- [write_spice_deck](#)

Related Information

- "Aging-Aware STA Analysis" chapter in the *Tempus Stylus User Guide*.

report_aging_activity

```
report_aging_activity  
[-help]  
[-duty_cycle]  
-net <string>  
[-out_file <string>]  
[-toggle_rate]  
[-views <string>]
```

Reports the duty cycles and toggle rates.

Parameters

-help	Prints out the command usage.
-duty_cycle	Specifies the dump duty cycles.
-net <string>	Specifies the net names.
-out_file <string>	Specifies the output file name.
-toggle_rate	Specifies the dump toggle rates.
-views <string>	Specifies the list of view names.

Examples

- The following command reports the toggle rate and duty cycle information on net `net_dcu[36]`. The output file “out.txt” will contain the required information:

```
tempus > report_aging_activity -duty_cyclly -toggle_rate -net net_dcu[36] -out_file  
out.txt
```

Related Commands

- `create_aging_stress_profile`
- `set_aging_activity`
- `get_aging_activity`
- `write_spice_deck`

Related Information

"[Aging-Aware STA Analysis](#)" chapter in the *Tempus User Guide*.

report_aging_stress_profile

```
report_aging_stress_profile  
[-help]  
[-early]  
[-late]  
[-views <string>]
```

Reports the stress profiles for aging-aware STA defined using the `create_aging_stress_profile` command. The report contains stress duration, stress temperature, and stress voltage per power rail.

Parameters

-help	Prints out the command usage.
-early	Reports the stress profile associated with early paths.
-late	Reports the stress profile associated with late paths.
-views <string>	Specifies a list of view names associated with the aging stress profile.

Related Commands

- `create_aging_stress_profile`
- `set_aging_activity`
- `get_aging_activity`
- `report_aging_activity`
- `write_spice_deck`

Related Information

- ["Aging-Aware STA Analysis"](#) chapter in the *Tempus Stylus User Guide*.

report_delay_calculation

```
report_delay_calculation
[-help]
[-active_arcs]
-from port_or_pin_name
[-max]
[-min]
[-mis]
[-out_file string]
[-si]
[-show_all_attackers]
[-thresholds]
-to port_or_pin_name
[-view viewname]
[-voltage]
[-waveform]
```

Reports the delay calculation information for a cell or net timing arc. You can use this command to report delay calculation details for the specified timing arc. The delay calculation report may be useful for debugging timing or for verifying timing data.

You can run the [report_timing](#) command before running `report_delay_calculation` to have the correct timing window and aggressor slew.

Note: The `report_delay_calculation` command does not support AOCV derating.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>report_delay_calculation</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man report_delay_calculation</code> .
-active_arcs	Disables reporting of all the non-active parallel delay arcs and reports only the valid check arcs.
-from port_or_pin_name	Specifies the name of the From port or pin. If the From port or pin is output of a cell and To port or pin is input of a cell, delay is calculated for the net and the delay type in the report is 'net delay.' If the From port or pin is input of a cell and To port or pin is output of a cell, delay is calculated for the cell and the delay type in the report is 'cell delay.'

-max	Indicates that the delay calculation report is for the worst-case operating conditions in min-max mode. If neither <code>min</code> nor <code>max</code> arguments are specified, then the default mode is set to <code>max</code> .
-min	Indicates that the delay calculation report is for the best-case operating conditions in min-max mode. If neither <code>min</code> nor <code>max</code> arguments are specified, then the default mode is set to <code>max</code> .
-mis	Reports advanced multi-input switching (AMIS) details.
-out_file <i>filename</i>	Specifies the name of the output file in which to save the delay calculation report.
-si	Reports signal integrity (SI) related information.
- show_all_attackers	Includes all the attackers in the report.
-thresholds	Displays the rise delay, rise slew, fall delay, fall slew, and slew delay threshold values for the From and To pins.
-to <i>port_or_pin_name</i>	Specifies the name of the To port or pin. If the From port or pin is output of a cell and To port or pin is input of a cell, delay is calculated for the net and the delay type in the report is 'net delay.' If the From port or pin is input of a cell and To port or pin is output of a cell, delay is calculated for the cell and the delay type in the report is 'cell delay.'
-view <i>viewname</i>	Specifies the view name for which to print the delay calculation report when using the multi-mode multi-corner (MMMC) mode.
-voltage	Displays the voltage of the cell or net timing arc.
-waveform	Reports the waveforms of the pins.

Examples

- The following command shows the cell delay calculation report for the from pin I1/A and to pin I1/Y:

```
tempus> report_delay_calculation -from I1/A -to I1/Y
```

```
From pin : I1/A
```

```
To Pin : I1/Y
```

```
Cell : S2INVV1D1
```

```
Library : test
```

Arc sense : negative unate

Delay type : cell delay

set_aging_activity

```
set_aging_activity
[-help]
[-max_duty_cycle <float>]
[-max_toggle_rate <(number of transitions per second)>]
[-min_duty_cycle <float>]
[-min_toggle_rate <float>]
-net <string>
[-views <string>]
```

Defines the duty cycles on nets.

By default, all the signals in STA are assumed to be 50% of duty cycle at primary pins. The duty cycle for clock waveforms can be specified in the SDC. The same duty cycle is assumed at every clock pin associated with that waveform. You can override the duty cycle defaults for primary ports, as well as force duty cycles on specific nets in the design.

Starting from the initial default values (and user-overrides), Tempus propagates the duty cycle across the logic. Tempus gives higher priority to user-defined duty cycle than duty cycle obtained from the SDC, using either constants or clock waveforms.

Parameters

-help	Prints out the command usage.
-max_duty_cycle <float>	Specifies the maximum duty cycle. Min: 0, Max: 1
-max_toggle_rate <(number of transitions per second)>	Specifies the maximum toggle rate. Min: 0, Max: 3.40282346638529e+38
-min_duty_cycle <float>	Specifies the minimum duty cycle. Min: 0, Max: 1
-min_toggle_rate <float>	Specifies the minimum toggle rate (number of transitions per second). Min: 0, Max: 3.40282346638529e+38
-net <string>	Specifies the net names.
-views <string>	Specifies the list of view names.

Examples

- The following command specifies the maximum duty cycle of 0.5 and minimum duty cycle of 0.3 on `net net_ops[0]` for view `view1`:

```
tempus > set_aging_activity -max_duty_cycle 0.5 -min_duty_cycle 0.3 -net net_ops[0] -  
view view1
```
- The following command specifies the maximum and minimum toggle rate on `net net_pfs[45]`:

```
tempus > set_aging_activity -min_toggle_rate 1e6 -max_toggle_rate 3e9 -net net_pfs[45]
```

[-type {bti | hci | all}]
[-use_fixed_duty_cycle {true | false}]
[-views <string>]
```

Sets the aging analysis related global variable settings and defaults.

By default, all the signals in STA are assumed to be 50% of duty cycle at primary pins. The duty cycle for clock waveforms can be specified in the SDC. The same duty cycle is assumed at every clock pin associated with that waveform. You can override the duty cycle defaults for primary ports, as well as force duty cycles on specific nets in the design.

Starting from the initial default values (and user-overrides), Tempus propagates the duty cycle across the logic.

Parameters

-help	Prints out the command usage.
-activity_propagation_mode {probabilistic worst_case}	Specifies the activity (duty cycle and toggle rate) propagation mode - probabilistic or worst_case. <i>Default:</i> probabilistic
-constraints {true false}	Enables the aging constraints. <i>Default:</i> false

<code>-disable_aging</code>	Disables aging analysis.
<code>-max_duty_cycle <value></code>	Specifies the default maximum duty cycle. <i>Default:</i> 1 <i>Min:</i> 0, <i>Max:</i> 1
<code>-max_toggle_rate <value></code>	Specifies the default maximum toggle rate (number of transitions per second). <i>Default:</i> 100000000 <i>Min=</i> 0, <i>Max=</i> 3.40282346638529e+38
<code>-max_toggle_rate_limit <value></code>	Specifies the maximum toggle rate limit. <i>Default=</i> 3.40282346638529e+38 <i>Min=</i> 0, <i>Max=</i> 3.402
<code>-min_duty_cycle <value></code>	Specifies the default minimum duty cycle. <i>Default:</i> 0 <i>Min:</i> 0, <i>Max:</i> 1)
<code>-min_toggle_rate <value></code>	Specifies the default minimum toggle rate (number of transitions per second). <i>Default:</i> 0 <i>Min:</i> 0, <i>Max:</i> 3.40282346638529e+38)
<code>-param_priority_sets <string></code>	Specifies an ordered list of lists of additional parameters to be used for aging for all the views, e.g., { {p1 p2 p3} {q1 q2} }; parameters from the aging library will always get the highest priority.
<code>-recovery {true false}</code>	Enables the aging recovery analysis. <i>Default:</i> true
<code>-sequential_activity_propagation {true false}</code>	Enables the activity propagation through sequentials. <i>Default:</i> false
<code>-sequential_max_duty_cycle <value></code>	Specifies the default sequential maximum duty cycle. <i>Default:</i> 1 <i>Min:</i> 0, <i>Max:</i> 1

<code>-sequential_max_toggle_rate <value></code>	Specifies the default sequential maximum toggle rate (number of transitions per second). <i>Default=100000000</i> <i>Min: 0, Max: 3.40282346638529e+38</i>
<code>-sequential_min_duty_cycle <value></code>	Specifies the default sequential minimum duty cycle. <i>Default: 0</i> <i>Min: 0, Max: 1</i>
<code>-sequential_min_toggle_rate <value></code>	Specifies the default sequential minimum toggle rate (number of transitions per second). <i>Default: 0</i> <i>Min: 0, Max=3.40282346638529e+38)</i>
<code>-type {bti hci all}</code>	Specifies the type of aging analysis - bti, hci, or all. <i>Default: all</i>
<code>-use_fixed_duty_cycle {true false}</code>	Enables the fixed duty cycle instead of propagated duty cycle for aging <i>Default: false</i>
<code>-views <string></code>	Specifies a list of view names for the defined settings.

Examples

- The following command sets the minimum and maximum toggle rate on ports and special nets. This should be specified when HCI analysis is enabled in the flow:

```
tempus > set_aging_analysis_mode -min_toggle_rate 1e+09 -max_toggle_rate 1e+09
```
- The following command sets toggle rate on sequential cells output pins. This should be specified when HCI analysis is enabled in the flow:

```
tempus > set_aging_analysis_mode -sequential_min_toggle_rate 1e+09 -  
sequential_max_toggle_rate 1e+09
```
- The following command models recovery for OMI and URI Spice models that are recovery-aware:

```
tempus > set_aging_analysis_mode -recovery true
```
- The following command specifies the minimum and maximum toggle rate and duty cycle for probabilistic propagation mode:

```
tempus > set_aging_analysis_mode -activity_propagation_mode probabilistic \  
-min_toggle_rate 1e9 -max_toggle_rate 1e9 -min_duty_cycle 0 -max_duty_cycle 0.2
```

write_exclude_nets

```
write_exclude_nets  
[-help]  
out_file
```

Writes out the excluded nets to an output file. Nets that exceed the default value of 1,000 pins are excluded from delay calculation, and default delay values are used. .

You can use `delaycal_excluded_net_file` attribute to use the file containing nets to be excluded during delay calculation. The list of excluded nets can be redirected to an output file.

Parameters

<code>-help</code>	Prints out the command usage
<code><i>out_file</i></code>	Specifies the name of the excluded net file.

write_set_load

```
write_set_load  
[-help]  
out_file  
[-direct]  
[-exclude_zero_cap]  
[-include_pin_cap]  
[-view string]  
[-wire_load]
```

Writes the specified capacitance on the specified ports or nets of the top cell to an output file.

Parameters

-help	Prints out the command usage.
out_file	Specifies the output file name.
-direct	Refers to the ports directly.
-exclude_zero_cap	Excludes the net that has zero net capacitance.
-include_pin_cap	Includes the pin capacitance.
-view <i>string</i>	Specifies the view name for the output file.
-wire_load	Marks the <code>set_load -wire_load</code> option for a port. This interprets the specified capacitance as the external wire capacitance of the port.

Distributed MMMC Commands

- [distribute_command](#)
- [distribute_design_views](#)
- [distribute_read_db](#)
- [distribute_views](#)
- [get_distributed_variables](#)
- [reset_servers](#)
- [set_distributed_mmmc_mode](#)
- [set_distributed_variables](#)

distribute_command

```
distribute_command  
[-help]  
[ list_of_commands]  
[-views list_of_views]
```

Distributes interactive analysis commands. When you use this command, multi-mode multi-corner (MMMC) analysis is not run again and the *[list_of_commands]* is run on existing active views.

You can use `distribute_command` when either of the following commands is run:

- `distribute_read_design -restore_design`
- `distribute_views -views {viewnames}`

Parameters

<code>-help</code>	Prints out the command usage.
<code><i>list_of_commands</i></code>	Specifies commands to be distributed. The commands that are required to be run only at the Tempus client should be enclosed in {}. You can specify multiple commands in a single <code>distribute_command</code> statement. <pre>tempus > distribute_command { report_timing -through [get_nets net1] set endPin [get_pins u1/a] ; report_timing -to \$endPin }</pre> The commands that are required to take variable value from the master Tempus session should be enclosed in " ". For example, the following commands create two variables <code>testVar1</code> and <code>testVar2</code> on Tempus client with variable values being the same as on master Tempus session. <pre>set testVar1 val1 ; set testVar2 val2 distribute_command "foreach var {testVar1 testVar2} {set \$var \$[subst \$var]} "</pre>
<code>- <i>views list_of_views</i></code>	Specifies the views to be distributed.

Related Commands

- `distribute_read_design`
- `distribute_views`
- `set_multi_cpu_usage`

distribute_design_views

```
distribute_design_views
[-help]
[-client_log_file prefix]
[-create_boundary_model]
[-create_boundary_model_args <string>]
[-load_boundary_model <string>]
[-load_boundary_model_args <string>]
[-write_db {list_of_views | all}]
[-views list_of_views | -read_dir path]
[-views list_of_views | -read_db {views | all}]
[-views list_of_views | -read_cellview {lib | cell}]
[-design_script inputTclCmdFile | -read_dir path]
[-design_script inputTclCmdFile | -read_db {views | all}]
[-design_script inputTclCmdFile | -read_cellview {lib | cell}]
[-read_db {views | all} -read_dir path]
[-views list_of_views [-analysis_script list_of_commands]]
[-analysis_script list_of_commands [-views list_of_views]]
[-views list_of_views [-set_analysis_view_log | -combine_num_views integer]]
[-out_dir outputDir [-design_script inputTclCmdFile | -read_dir path]]
```

Allows the Tempus software to process a view as soon as a client is available.

When this command is used, the software does not have to wait till time out or for all the clients to be available for processing a view. This reduces the turnaround time in situations where machines are not easily available.

Parameters

-help	Prints out the command usage.
-analysis_script <i>list_of_commands</i>	Specifies the file that contains commands for reading in the necessary parasitic files and the reporting commands.
-client_log_file <i>prefix</i>	Specifies the client log filename prefix with the directory.
-combine_num_views <i>integer</i>	Specifies the number of views to combine in a job.
-create_boundary_model	Allows the software to generate boundary models.
- create_boundary_model_args < <i>string</i> >	Specifies the arguments provided to the create_boundary_model command during boundary model generation.

<code>-design_script <i>inputTclCmdFile</i></code>	Specifies the name of the design and MMMC configuration loading script. The <code>-design_script</code> is mutually exclusive with <code>restore_*</code> options.
<code>-load_boundary_model</code>	Specifies the directory from where boundary model will be loaded.
<code>-load_boundary_model_args <string></code>	Specifies the arguments provided to the <code>read_boundary_model</code> command. For example: <code>distribute_design_views -load_boundary_model {-skip_version_check}</code> When specified, the software skips version checks while loading the boundary model in DMMMC flow.
<code>-out_dir <i>outputDir</i></code>	Specifies the directory where the run is to be executed.
<code>-read_cellview {<i>lib</i> <i>cell</i>}</code>	Specifies the name of OA library or cell to be restored.
<code>-read_db {<i>views</i> <i>all</i>}</code>	Specifies a list of views.
<code>-read_dir <i>path</i></code>	Specifies the directory path where the design is to be restored.
<code>-write_db {<i>list_of_views</i> <i>all</i>}</code>	Saves the design session information for the specified (or all) the analysis views.
<code>-set_analysis_view_log</code>	Redirects the <code>set_analysis_view</code> command run log to <code>set_analysis_view_<viewname>.log</code> file.
<code>-views {<i>list_of_views</i>}</code>	Specifies the views to distribute for both setup and hold analysis • The <code>-views</code> parameter is mutually exclusive with <code>restore_*</code> options. • The <code>-views</code> parameter is mandatory when <code>-set_analysis_view_log</code> and <code>-combine_num_views</code> parameters are specified.

Related Commands

- `set_multi_cpu_usage`
- `set_distributed_hosts`
- `set_analysis_view`

distribute_read_db

```
distribute_read_db
[-help]
[-client_log_file string]
-out_dir string
[-read_cellview {directory cell_name}]
{-design_script string | [-read_db string [-read_dir string]]}
```

Opens up N number of Tempus clients (as set with [set_multi_cpu_usage](#)) for a distributed processing session, and loads the design script on Tempus clients.

The `distribute_read_db` command is used for distributed multi-mode multi-corner (DMMMC) timing analysis only.

Parameters

-help	Prints out the command usage.
- client_log_file logFilePathName	Redirects client logs to a new location. By default, Tempus client logs are created in the directory specified with the <code>-out_dir</code> option.
-design_script string	Specifies the design loading script. The script contains the common information that needs to be shared by all Tempus client runs. The script must include the design loading commands, as well as all MMMC configuration commands. The script must not include parasitic file loading commands (<code>read_spef</code>), analysis view setting commands (<code>set_analysis_view</code>) or the view specific settings like constraints through <code>set_interactive_constraint_modes</code> . Timing derates settings (<code>set_timing_derate</code>) are corner specific and can be specified in this script.
-out_dir string	Specifies the directory where the run is to be executed. All data from the distributed analysis runs will be available in this directory. The software generates view-specific reports in directories with the corresponding view name within this directory.
-read_cellview {directory cell_name}	Specifies the “directory” as a directory name having OpenAccess library name/OA cell and “cell_name” refers to the OA cell name.

<code>-read_db string</code>	Specifies the design views (previously saved using the <code>distribute_views -write_design</code> command) to be restored for both setup and hold analysis.  The number of sessions specified for restore can not be more than the machines specified with <code>-remoteHost</code> setting.
<code>-read_dir string</code>	Specifies the directory location which has the saved design views (that were previously saved using the <code>distribute_views -write_design</code> command) to be restored.

Examples

Here are some examples.

- The following example command script lists the commands used to perform distributed multi-mode multi-corner timing analysis:

```
tempus > set_multi_cpu_usage -remoteHost 4
tempus > distribute_read_db \
-design_script /stml/timing/demo_dist_proc/preamble.tcl \
-out_dir $output_directory
#preamble.tcl script includes design loading commands and MMMC configuration commands

set Views [list lmin-rmax lmax-rmin lmax-rmax]
tempus > distribute_views \
-views $Views \
-script /stml/timing/demo_dist_proc/commands.tcl
#commands.tcl script contains read_spef and report commands

tempus > reset_servers
```

- The following example command script lists the commands used to save a design in distributed multi-mode multi-corner mode:

```
tempus > set_distributed_hosts -local | -rsh ...
tempus > set_multicpu_usage -remoteHosts N
tempus > distribute_read_db -design_script dmmmc.tcl -out_dir output
set Views [list lmin-rmax lmax-rmin lmax-rmax]
tempus > distribute_views -views $Views -script dmmmc_report.tcl -write_design all
```

- The following example command script lists the commands used to restore a saved session (with N views) in distributed multi-mode multi-corner mode:

```
tempus > set_distributed_hosts -local
tempus > set_multicpu_usage -remoteHosts N
set Views [list lmin-rmax lmax-rmin lmax-rmax]
```

```
tempus > distribute_read_db -read_db $Views -read_dir output -out_dir new_output
# output is the same directory used in above example where views were saved.
```

```
tempus > distribute_command {source dmmmc_reports2.tcl}
# dmmmc_reports2.tcl can have analysis commands but do not need read_spef etc.
```

- The following example restores the dtmf_chip OpenAccess design, which is saved at the path, /home/cdns/oa_dir:

```
tempus > set outDir "/home/cdns/" distribute_read_db -read_db {view1 view2} -read_dir
$outDir -read_cellview {oa_dir dtmf_chip} -out_dir output
```

distribute_views

```
distribute_views  
[help]  
[-combine_num_views]  
[-force_distribute]  
-views list_of_views  
-script filename  
[-write_db {list_of_views | all}]  
[-set_analysis_view_log]
```

Distributes the specified analysis views to the Tempus client(s), then sources the specified command script to perform timing and signal integrity analysis.

The `distribute_views` command is used for distributed multi-mode multi-corner (DMMMC) timing analysis only. Distributed multi-mode multi-corner timing analysis is executed in batch mode. You can use the `distribute_command` for running a single command interactively.

By default, this command distributes a single view per Tempus client. The command can also perform concurrent multi-mode multi-corner timing analysis (CMMMC), within the DMMMC framework. You can combine the analysis views for CMMMC analysis on Tempus client(s). This can be done in the following two ways:

1. Delay corner based auto grouping :

You can specify a simple list of view names in the `-view` option and use the `-combine_num_views` option to specify the maximum number of views to be combined per Tempus client. For example

```
tempus > distribute_views -combine_num_views 4 -views {setup1 setup2 setup3 setup4  
setup5 setup6 setup7 setup8} -script ...
```

Assuming setup1 to setup4 have delay corner dc1 and setup5 to setup8 have delay corner dc2 then above example will group setup1 to setup4 to Tempus client1 and setup5 to setup8 will be grouped to Tempus client2

2. User controlled view grouping:

You can specify a list of list format for combining multiple concurrent views on Tempus client(s). For example,

```
distribute_views -views { {setup1 setup2 setup3 setup4 } { setup5 setup6 setup7 setup8 }  
} -script ...
```

The above command will group setup1 to setup4 views to Tempus client1 will group setup5 to setup8 views to Tempus client2 irrespective of the delay corner. To get optimum runtime while using view grouping, it is recommended to use delay corner based auto grouping as mentioned in example 1 above.

In this release, Tempus supports one step method for generating merged MMMC view report from DMMMC master shell. After running the `distribute_views` command, you can issue a single `report_timing/report_constraint` command, which generates reports collectively from all active distributed views (that is, views available for interactive DMMMC analysis). The merged output report is arranged as per slack/criticality order across active views.
All the options of `report_constraint` command, except `-connection_class`, and all the options of `report_timing` command are supported in this mode.

Parameters

<code>-help</code>	Prints out the command usage.
<code>-combine_num_views</code>	Combines upto N views (having same delay corner) to run at the same time on the same Tempus client.
<code>-force_distribute</code>	Forces the full timing update for given set of views (specified in subsequent <code>distribute_views</code> command) even if those views are already active on Tempus client(s). By default The existing active view(s) will not be re-analyzed and the remaining views from the distribution list will be dispatched for full timing update.
<code>-write_db</code> <code>{list_of_views all}</code>	Saves the design session information for the specified analysis views. You can use the <code>-write_db all</code> option to save all the distributed multi-mode multi-corner (DMMMC) sessions with views that are specified using the <code>-views</code> parameter. The design information is saved in the following location: <pre>\${outdir}/<viewname>/<topcell.enc.dat></pre> where <code>\${outdir}</code> is the location specified using the <code>distribute_read_design -outdir</code> command. Note: When you specify this parameter, any previously saved sessions in <code>outdir</code> will be overwritten. When the <code>-write_db</code> parameter is specified, a distributed OpenAccess (OA) database will be created in the following format during a distributed MMMC run: <pre>LibName = \$outdir CellName = same as OA design Cell Name Views = List of MMMC Views</pre>

<code>-script filename</code>	Specifies the file that contains list of commands for reading in the necessary parasitic files and the reporting commands required for timing and signal integrity analysis. Commands for reading parasitic information must be specified in the script before the reporting commands. You must specify parasitic files specific for all RC corners. For example: <pre>read_spef -rc_corner corner1 rc1.spef read_spef -rc_corner corner2 rc2.spef read_spef -rc_corner corner3 rc3.spef read_spef -rc_corner corner4 rc4.spef</pre> If the file includes report commands that redirect their output to a specified file the software generates the file in the active view directory, in the output directory specified with the <code>distribute_read_design</code> command. (for example: for below command specified in the script <pre>report_timing >rt.rpt</pre> software will generate <code>rt.rpt</code> file in <code>\${outdir}/<viewname></code> directory for each active view where <code>\${outdir}</code> is the location specified using the <code>distribute_read_design -outdir</code> command. For report commands with no redirection specified, the software generates the report in the corresponding log file.
<code>-set_analysis_view_log</code>	Redirects <code>set_analysis_view</code> run log to <code>set_analysis_view_<viewname>.log</code> file.
<code>-views list_of_views</code>	Specifies views to distribute for analysis. Note: The <code>-views</code> parameter is mandatory when the <code>-set_analysis_view_log</code> and <code>-combine_num_views</code> parameters are specified.

Examples

Here are some examples.

- The following example command script `run_dmmmc.tcl` lists the commands used to perform distributed multi-mode multi-corner timing analysis. The script performs distributed analysis for four views on four Tempus clients and then saves the design:

```
tempus > set_multi_cpu_usage -remote_host 4
tempus > distribute_read_db \
-design_script /stml/timing/demo_dist_proc/preamble.tcl \
```

```
-out_dir $output_directory
```

```
set views [list lmin-rmax lmin-rmin lmax-rmin lmax-rmax]
```

```
tempus > distribute_views \
```

```
  -views $views \
```

```
  -script /stml/timing/demo_dist_proc/commands.tcl \
```

```
  -write_db {all}
```

```
tempus > reset_servers
```

- The following command script `commands.tcl` generates `setup.rpt` and `hold.rpt` reports for all the four views:

```
tempus > read_spef -rc_corner rmin /stml/timing/demo_dist_proc/min.spef.gz
```

```
tempus > read_spef -rc_corner rmax /stml/timing/demo_dist_procmx.spef.gz
```

```
tempus > report_timing -late > setup.rpt
```

```
tempus > report_timing -early > hold.rpt
```

- The following command script `report_common.tcl` generates `setup.rpt` and `hold.rpt` reports for two views each:

```
set mySetupViews "lmax-rmin lmax-rmax"
```

```
set myHoldViews "lmin-rmax lmin-rmin"
```

REPORTS FOR SETUP VIEWS

```
[get_db [get_db analysis_views -if {.is_setup||.is_hold} ] .name -u]
```

```
set reportSetup 0
```

```
foreach vName $currentView { if { [lsearch $mySetupViews $vName ] != -1 } { set  
reportSetup 1 ; break; } }
```

```
if { $reportSetup } {
```

```
## ALL Setup View reporting Commands
```

```
report_timing -late > setup.rpt
```

```
}
```

REPORTS FOR HOLD VIEWS

```
set currentView [analysis_views] ;
```

```
set reportHold 0
```

```
foreach vName $currentView { if { [lsearch $myHoldViews $vName ] != -1 } { set  
reportHold 1 ; break; } }
```

```
if { $reportHold } {
```

```
## ALL Hold View reporting Commands
```

```
report_timing -early > hold.rpt  
}
```

Related Topics

- [Distributed Multi-Mode Multi-Corner Timing Analysis](#) chapter in the *Tempus User Guide*

Related Commands

- `set_multi_cpu_usage`
- `read_spef`
- `report_timing`

get_distributed_variables

```
get_distributed_variables  
[-help]
```

Retrieves variables from Tempus clients. The results of each variable are stored in the master session as a TCL array with the view name as the key or search index.

When the result is created in the form of TCL variables at the Tempus client, the resulting variables can be retrieved back to the master session anytime after one of the following commands is run:

- `distribute_views -views`
- `distribute_read_design -restore_design`

Parameters

<code>-help</code>	Prints out the command usage.
<code>list_of_slave_variables</code>	List of slave variables to be returned to master.
<code>-result_array_2d</code>	Generates tcl array at master for each child array variable with viewname as additional index. <i>Default:</i> Array variables retrieved as tcl list indexed only by view name

Examples

Here are some examples.

- Assuming `setUpView` and `holdView` views are active on two Tempus clients. The following example command script retrieves the value of variables `slackTest` and `arrivalTest` from each Tempus client to master session:

```
# define/set some value for variables at the Tempus client:
```

```
1) tempus > distribute_command {  
  array set arrivalTest [list a 1 b 2 c 5 d 7] ;  
}
```

```
get_distributed_variables arrivalTest
```

```
Puts "ARRIVAL = [array get arrivalTest]"
```

Output of this example will be:

```
ARRIVAL = holdView {d 7 a 1 b 2 c 5} setUpView {d 7 a 1 b 2 c 5}
```

```
2) tempus > distribute_command {  
  array set slackTest [list a -1 b -2 c -5 d -7]  
}  
get_distributed_variables -array_as_multi_dim_array slackTest  
  
Puts "SLACK = [array get slackTest]"
```

Output of this example will be:

```
SLACK = setupView,a -1 holdView,d -7 setupView,b -2 holdView,a -1 setupView,c -5  
holdView,b -2 setupView,d -7 holdView,c -5
```

Related Commands

- [distribute_read_design](#)
- [distribute_views](#)

reset_servers

```
reset_servers  
-help  
[-view viewName]
```

Releases the Tempus client(s) and ends the distributed processing session. Specify the `reset_servers` command after analysis is finished.

The `reset_servers` command is used for distributed multi-mode multi-corner timing analysis only.

Parameters

-help	Prints out the command usage.
-view viewName	Removes user-specified view(s) and releases the corresponding Tempus client. This parameter can be used after the <code>distribute_views</code> command is issued. After removing some view(s), you can resume performing interactive analysis for remaining views, however, you cannot run the <code>distribute_views</code> command again in the same session.

Examples

Here are some examples.

- The following example command script will release all Tempus clients after performing distributed multi-mode multi-corner timing analysis for all views:

```
tempus > set_multi_cpu_usage -remoteHost 4  
  
tempus > distribute_read_design \  
-design_script /stm1/timing/demo_dist_proc/preamble.tcl \  
-outidr $output_directory  
set views [list lmin-rmax lmax-rmin lmax-rmax lmin-rmin]  
#preamble.tcl script includes design loading commands and MMMC configuration commands  
  
tempus > distribute_views \  
-views $views \  
-script /stm1/timing/demo_dist_proc/commands.tcl  
#commands.tcl script contains read_spef and report commands
```

`reset_servers`

set_distributed_mmmc_mode

```
set_distributed_mmmc_mode
[-help]
[-client_init_execute_script filename]
[-eco {true | false}]
[-enable_high_capacity_eco]
[-eco_merge_mmmc]
[-enable_smart_mmmc]
[-lic_startup_extra {list_of_options}]
[-load_def_only]
[-min_hosts_required integer]
[-set_filler_mode {list_of_options}]
[-interactive {true | false} [-views {list_of_views | all}]]
[-use_one_host_per_batch_job {true | false}]
```

Controls distributed MMMC analysis settings.

Parameters

-help	Prints out the command usage.
- client_init_execute_script filename	Specifies a file containing the TCL code that will be executed on a Tempus client(s) immediately after it is invoked. This allows you to load settings on a client prior to loading a database or design initialization.
-eco {true false}	Enables/disables the timing signoff flow integrated with distributed MMMC.
-enable_high_capacity_eco	Enables database size reduction in the Tempus Paradime flow or Certus for high capacity ECO timing/power closure based on timing violations, list of partition names, or user-defined path group. Note: It is mandatory to apply <code>set_distributed_mmmc_mode -eco true</code> command before <code>set_distributed_mmmc_mode -enable_high_capacity_eco</code> in Tempus Paradime flow. In case of Certus, it should be set before <code>distribute_read_db</code> .
-eco_merge_mmmc	Creates ECO analysis view(s) from view definition files in restore sessions. The <code>-eco_merge_mmmc</code> parameter must be used only after <code>set_distributed_mmmc_mode -eco true</code> command is set.

<code>-enable_smart_mmmc</code>	Enables reduced memory or runtime solution when many timing views are enabled in Tempus Paradime flow or Certus. Note: It is mandatory to apply <code>set_distributed_mmmc_mode -eco true</code> command before <code>set_distributed_mmmc_mode -enable_smart_mmmc</code> in Tempus Paradime flow. In case of Certus, it should be set before <code>distribute_read_db</code>.
<code>-lic_startup_extra</code> <code>{list_of_options}</code>	Specifies a list of licenses to be checked out by Tempus clients. When specified, the software shows the extra Innovus startup licenses that are checked out by Tempus clients.
<code>-load_def_only</code>	Specifies if a client database being restored in a flow contains LEF information and needs to load DEF (specified using the <code>eco_def_file_list</code> variable), to make it a fully physical flow.
<code>-interactive {true false}</code>	Enables or disables the interactive mode.
<code>-min_hosts_required</code> <code>integer</code>	Specifies minimum number of machines required to start a session in case all the machines cannot be acquired after time out.
<code>-set_filler_mode</code> <code>{list_of_options}</code>	Specifies a list of <code>set_db</code> command options. This parameter allows to pass a list of options that the <code>set_db</code> command applies during physical data loading in Tempus Paradime.
<code>-</code> <code>use_one_host_per_batch_job</code> <code>{true false}</code>	Enables/disables one batch mode job per host. A new client is started for each view or each combined view job. This is used when running flows, such as manual ECO flows, where netlist updates during analysis makes scheduling of subsequent views difficult.
<code>-views {list_of_views all}</code>	Specifies a list of views for interactive mode. The <code>all</code> option selects all the view.

Examples

- The following commands enable the distributed MMMC analysis in interactive mode for views `view1` and `view2`:

```
tempus > set viewnames {view1 view2}
tempus > set_distributed_mmmc_mode -views $viewnames -interactive true
```
- The following command disables the interactive mode once all the reporting/ECO on interactive

views is done:

```
tempus > set_distributed_mmmc_mode -interactive false
```

- The following command lists all the filler cell names to be applied on `set_filler_mode` command:

```
set_distribute_mmmc_mode -set_filler_mode {-core "FILLX1 FILLX2 FILLX4"}
```

Related Commands

- `set_multi_cpu_usage`
- `distribute_read_db`
- `distribute_views`
- `set_db`

set_distributed_variables

```
set_distributed_variables  
[-help]  
list_of_variables  
[value]
```

Allows you to set variables on the Tempus master and clients.

The variables can be set after issuing the `distribute_read_db` command on the master.

Parameters

<code>-help</code>	Prints out the command usage.
<code>list_of_variables</code>	Specifies a list of variables to be set on master and client(s).
<code>value</code>	Specifies the value which should be set on the master and client.

Examples

- The following command sets a variable `var` having value `1` on the master and client(s):

```
tempus > set_distributed_variables var 1
```
- The following command sets multiple variables with value `1` on master and client(s):

```
tempus > set_distributed_variables "var1 var2 var3" 1
```
- The following command sets multiple variables each with different values on master and client(s):

```
tempus > set var1 1  
1  
tempus > set var2 2  
2  
tempus > set var3 3  
3  
tempus > set_distributed_variables "var1 var2 var3"
```

Related Commands

- `get_distributed_variables`
- `distribute_read_db`
- `distribute_command`

check_flow

```
check_flow  
[-help]  
[-fail string]  
[-flow string]  
[-from string]  
[-proc string]  
[-step string]  
[-to string]
```

Creates a single `flow_step` object and fills-in the required, and some optional attributes. Further modifications of the step can be performed using the `set_db` command. If you try to define a step with the same name as an existing step, it results in error. To redefine a flow step, you must use the `set_db` command to modify the attributes, or delete and recreate it.

Note: Unlike Tcl procedures, flow steps do not take arguments and refer to attributes instead. The use of attributes requires that the data on which a step relies, is stored in the database and may be examined later.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>check_flow</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man check_flow.</code>
<code>-fail string</code>	Reports a problem. this is not used for analysis. It can only be used from Tcl called as part of static checking. Calling from outside static checking results in error.
<code>-flow string</code>	Runs the specified flow. the <code>from/to</code> values are based on the flow steps. <i>Default:</i> <code>flow_step_order</code>
<code>-from string</code>	Specifies the name of the step to start the flow from. By default, the flow starts from the first step that has not been run, or the first step if all steps have been run previously. Note: This must be a step in the flow.
<code>-proc string</code>	Checks the specified procedure instead of analysing a flow step.
<code>-step string</code>	Runs just the specified step. This takes priority over <code>from/to</code> options.
<code>-to string</code>	Specifies the name of the step to run to (inclusive; in other words, the named step is executed). By default, runs to the end of the last step in the flow. Must be a step in the flow, later than the <code>-from</code> step (if any).

create_flow

```
create_flow
[-help]
[steps]
-name name
[-owner string]
[-skip_metric]
[-tool tool]
[-tool_options options]
```

Creates a new, named flow object. `run_flow` then allows the execution of a named flow (in addition to its existing functionality).

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>create_flow</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man create_flow</code> .
<code>[steps]</code>	Specifies a list of flow step names in the order they must be executed. Note: This is an optional parameter. You can either provide <code>[steps]</code> or use the <code>-tool</code> parameter.
<code>-name name</code>	The name of the flow object to create.
<code>-owner string</code>	Specifies the owner of the flow.
<code>-skip_metric</code>	Restricts the tool from capturing the flow's metric snapshot.
<code>-tool tool</code>	Specifies the name of the tool with which to run this flow. This option allows you to create flows for other tools than the one currently running. If not specified, default is the current tool.
<code>-tool_options options</code>	Specifies options for use when launching this flow.

create_flow_step

```
create_flow_step
[-help]
body
[-categories string]
[-check checkTcl]
[-description string]
[-exclude_time_metric]
-name name
[-owner string]
[-write_db]
[-skip_metric]
```

Creates a single `flow_step` object and fills-in the required, and some optional attributes. Further modifications of the step can be performed using the `set_db` command. If you try to define a step with the same name as an existing step, it results in error. To redefine a flow step, you must use the `set_db` command to modify the attributes, or delete and recreate it.

Note: Unlike Tcl procedures, flow steps do not take arguments and refer to attributes instead. The use of attributes requires that the data on which a step relies, is stored in the database and may be examined later.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>create_flow_step</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man create_flow_step.</pre>
<code>body</code>	Specifies a block of Tcl that is run as the main action of the step.
<code>-categories string</code>	Defines the metric categories to calculate the flow step.
<code>-check checkTcl</code>	Specifies a block of Tcl to run step-specific static checks.
<code>-description string</code>	Describes the purpose for the current flow step.
<code>-exclude_time_metric</code>	Ensures that the CPU and wall time of the corresponding step is not included in any parent steps.
<code>-name name</code>	Specifies the name of the Tcl of the step. This can consist of alphanumeric characters and underscore only, and may not start with a digit. The following names have special meanings and may not be used for steps: • <code>next</code> • <code>end</code>
<code>-owner string</code>	Specifies the owner of the flow.
<code>-write_db</code>	Automatically saves a database when the flow step is complete.
<code>-skip_metric</code>	Skips generating metrics when the step is complete. By default, every step saves the design and runs metrics when completed.

define_feature

```
define_feature  
[-help]  
feature  
[-default string]  
[-description string]  
[-group string]  
[-obj string]  
[-possible_values string]  
[-required]  
[-type {bool string enum}]
```

Defines the feature for a flow.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>define_feature</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man define_feature</code>
<i>feature</i>	Specifies the name of the feature.
-default <i>string</i>	Specifies the default value of the feature.
-description <i>string</i>	Specifies the detailed description of the flow feature. If it matches multiple features, then these features are listed along with a short description for each. If it matches exactly one feature, a full description of this feature is printed. Matching no features results in an error.
-group <i>string</i>	Outputs the exclusive group that contains features.
-obj <i>string</i>	Specifies the flow or flow_step.
-possible_values <i>string</i>	Specifies the list of values that are valid for the features.
-required	Specifies that the mentioned feature is mandatory.
-type {bool string enum}	Specifies the type of feature value.

See also:

[Flow](#) chapter of the *Tempus Stylus Common UI Migration Guide* document.

delete_flow_config

```
delete_flow_config
[-help]
key ...
```

Deletes the configuration value at the specified key, allowing the user to change the type of a `setup.yaml` key by first deleting it.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>delete_flow_config</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man delete_flow_config</code>
<code>key</code> <code>...</code>	Specifies the key to delete the configuration value.

See also:

```
set_flow_config
```

edit_flow

```
edit_flow  
[-help]  
[-after string]  
[-append string]  
[-before string]  
[-enabled_feature string]  
[-owner string]  
[-prepend string]  
[-reset]  
[-unique]
```

Allows you to insert flow steps into an existing flow without redefining the flow itself. This command is very useful for flow customization.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>edit_flow</code> parameter.
<code>-after string</code>	Adds the specified <code>flow</code> and/or <code>flow_step</code> objects after the flow supporting a full canonical path to a flow step object.
<code>-append string</code>	Appends the specified <code>flow</code> and/or <code>flow_step</code> objects before or after the flow.
<code>-before string</code>	Adds the specified <code>flow</code> and/or <code>flow_step</code> objects before the flow supporting a full canonical path to a flow step object.
<code>-enabled_feature string</code>	Executes the <code>edit_flow</code> command only if the specified user-defined features are enabled.
<code>-owner string</code>	Specifies the owner of the flow being edited.
<code>-prepend string</code>	Adds the specified <code>flow</code> and/or <code>flow_step</code> objects before or after the flow.
<code>-reset</code>	Resets the customizations for the specified <code>flow</code> and/or <code>flow_step</code> objects before or after the flow.
<code>-unique</code>	Prevents the addition of the flow and/or <code>flow_step</code> objects, if those are already provided. This avoids duplication of the flow defined in the YAML file and the <code>edit_flow</code> statements scripted in the <code>tech_flow_steps</code> file. Note: This parameter prevents the specified <code>flow_step</code> from getting added to the same flow twice, irrespective of the values provided to the <code>-after</code> or <code>-before</code> parameters. For example, if <code>edit_flow -append bob -unique</code> is called twice to insert different <code>flow_steps</code> in the floorplan flow, it will add <code>bob</code> only once.

See also:

[Flow](#) chapter of the *Tempus Stylus Common UI Migration Guide* document.

Examples

- Following is an example of customizing the reference flow process using the `flow_config.template` file:

```
create_flow_step -name write_sdf {  
    write_sdf [get_db flow_report_directory]/[get_db local_flow].sdf  
}  
edit_flow -after flow_step:report_late_timing -append flow_step:write_sdf
```

- Following is an example of inserting an additional `step_2` step after the `step_1` step:

```
set file_dir [file dirname [ dict get [ info frame [ info frame ] ] file ] ]  
source ${file_dir}/scripts/run_flow.tcl  
create_flow_step -name step_2 {  
}  
edit_flow -append step_2 -after step_1
```

- Following is an example of adding flow customization to the `flow_config.tcl` file:

```
create_flow_step -name output_files {  
    set design_name [get_db current_design .name]  
    write_netlist [get_db flow_report_directory]/${design_name}.v  
    write_def [get_db flow_report_directory]/${design_name}.def  
}  
edit_flow -append flow_step:output_files -after flow_step:block_finish
```

end_flow

```
end_flow
[-help]
flow_or_step
```

Ends the specified flow or step. This command accepts a single string argument, which is a flow or step name. The specified string must match a flow or step in the path for the current step. Else, a Tcl error occurs. Flowkit/flowtool then skips all the contiguous steps to match the given flow or step name in the hierarchy.

Note: Calling `end_flow` outside of a `flow_step` inside `run_flow` (for example, `init_flow` plugin, `flow_header_tcl` or as a plain command) will produce an error.

Parameters

<code>-help</code>	Outputs a brief description that includes the type and default information for each <code>end_flow</code> parameter. For a detailed description of the command and all its parameters, use the <code>man</code> command: <code>man end_flow</code>
<code>flow_or_step</code>	Specifies the flow or step to be ended and skipped.

flow Category Attributes

The root attributes in the `flow` category are:

- [flow_branch](#)
- [flow_caller_data](#)
- [flow_db_directory](#)
- [flow_error_errorinfo](#)
- [flow_error_message](#)
- [flow_error_write_db](#)

- `flow_exclude_time_for_init_flow`
- `flow_exit_when_done`
- `flow_features`
- `flow_feature_values`
- `flow_footer_tcl`
- `flow_header_tcl`
- `flow_hier_path`
- `flow_history`
- `flow_log_directory`
- `flow_log_prefix_generator`
- `flow_mail_on_error`
- `flow_mail_to`
- `flow_metrics_file`
- `flow_metrics_snapshot_parent_uuid`
- `flow_metrics_snapshot_uuid`
- `flow_overwrite_db`
- `flow_plugin_canonical_current`
- `flow_plugin_names`
- `flow_plugin_steps`
- `flow_post_db_overwrite`
- `flow_remark`
- `flow_report_directory`
- `flow_run_tag`
- `flow_schedule`
- `flow_starting_db`
- `flow_startup_directory`
- `flow_status_file`
- `flow_step_canonical_current`
- `flow_step_check_tcl`
- `flow_step_current`

- `flow_step_last`
- `flow_step_last_msg`
- `flow_step_last_status`
- `flow_step_next`
- `flow_summary_tcl`
- `flow_template_feature_definition`
- `flow_template_tools`
- `flow_template_type`
- `flow_template_version`
- `flow_user_templates`
- `flow_top`
- `flow_verbose`
- `flow_working_directory`
- `flow_write_db_snapshot`
- `flow_write_db_snapshot_exclude_time`
- `flow_yamllint_exec`

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `flow` category, use the following command:

```
get_db -category flow
```

flow_branch

```
flow_branch string
```

Default: ""

Specifies the branch being run for a hierarchical flow.

flow_caller_data

`flow_caller_data` *string*

Default: ""

Specifies the data used by the caller of the tool for identifying the flow.

flow_db_directory

`flow_db_directory` *string*

Default: dbs

Specifies the flow directory where results databases are stored.

flow_error_errorinfo

`flow_error_errorinfo` *string*

Default: ""

Specifies the TCL error stack in the error database.

flow_error_message

`flow_error_message` *string*

Default: ""

Specifies the TCL error message in the error database.

flow_error_write_db

`flow_error_write_db` {true | false}

Default: true

Runs the database when an error occurs in a flow step.

flow_exclude_time_for_init_flow

`flow_exclude_time_for_init_flow` {true | false}

Default: false

Marks all those snapshots as `exclude_time_metric`, which were created after running the `init_flow` command. This marking adds user steps to the `init_flow` internal plugin locations.

flow_exit_when_done

`flow_exit_when_done {true | false}`

Default: `false`

Exits the flow after running the final step.

flow_features

`flow_features string`

Default: `""`

Specifies the global feature definitions.

flow_feature_values

`flow_feature_values string`

Default: `""`

Specifies the global feature settings.

flow_footer_tcl

`flow_footer_tcl string`

Default: `""`

Specifies the TCL script to run when a flow ends.

flow_header_tcl

`flow_header_tcl string`

Default: `""`

Specifies the TCL script to run when a flow starts.

flow_hier_path

`flow_hier_path` *string*

Default: ""

Displays the path of the current flow within the flow hierarchy.

flow_history

`flow_history` *string*

Default: ""

Displays the complete flow run history.

flow_log_directory

`flow_log_directory` *string*

Default: logs

Specifies the flow directory where log files are stored.

flow_log_prefix_generator

`flow_log_prefix_generator` *string*

Default: ""

Specifies the TCL script to create log filenames in flowtool.

flow_mail_on_error

`flow_mail_on_error` {true | false}

Default: false

Sends an email to 'flow_mail_to', if an error is detected.

flow_mail_to

`flow_mail_to` *string*

Default: ""

Specifies the email address where results are sent.

flow_metrics_file

`flow_metrics_file string`

Default: ""

Specifies the flow metrics file for reporting results.

flow_metrics_snapshot_parent_uuid

`flow_metrics_snapshot_parent_uuid string`

Default: ""

Specifies the snapshot uuid to which the results from this flow will be appended.

flow_metrics_snapshot_uuid

`flow_metrics_snapshot_uuid string`

Default: ""

Specifies the snapshot uuid of the most recent flow step executed.

flow_overwrite_db

`flow_overwrite_db {true | false}`

Default: false

Enables overwriting databases while saving.

flow_plugin_canonical_current

`flow_plugin_canonical_current string`

Default: ""

Identifies the canonical plugin step currently being run, enabling accurate detection of plugin within the Flowtool-based flows. When a plugin is not run, this attribute returns an empty value. Following is an example value of this attribute:

```
tool flowtool flow Cadence.plugin.flowkit.read_db.pre canonical_path {.end_steps
flow_step:test} step flow_step:test features {} str test
```

flow_plugin_names

`flow_plugin_names` *string*

Default: ""

Displays the names of all the internal plugin points.

flow_plugin_steps

`flow_plugin_steps` *string*

Default: ""

Displays the list of plugin steps that have been added through `edit_flow`.

flow_post_db_overwrite

`flow_post_db_overwrite` *string*

Default: ""

When this attribute is set within `skip_db flow_step`, you can identify the name and type of database from the current to future flows as `flow_starting_db`.

flow_remark

`flow_remark` *string*

Default: ""

Displays the remarks from the last loaded `flow.yaml` file.

flow_report_directory

`flow_report_directory` *string*

Default: reports

Specifies the flow directory where reports are written.

flow_run_tag

`flow_run_tag` *string*

Default: ""

Specifies the tags for the particular flow run.

flow_schedule

`flow_schedule string`

Default: ""

Specifies the set of flows to execute after the current flow completes.

flow_starting_db

`flow_starting_db string`

Default: ""

Specifies the starting database for the flow run.

flow_startup_directory

`flow_startup_directory string`

Default: /home/user_id

Specifies the directory from where the software was run.

flow_status_file

`flow_status_file string`

Default: ""

Specifies the file for flow status.

flow_step_canonical_current

`flow_step_canonical_current string`

Default: ""

Specifies the currently running canonical flow step.

flow_step_check_tcl

`flow_step_check_tcl` *string*

Default: ""

Specifies the procedure to check the steps.

flow_step_current

`flow_step_current` *string*

Default: ""

Specifies the currently running flow step.

flow_step_last

`flow_step_last` *string*

Default: ""

Specifies the last flow step to be completed.

flow_step_last_msg

`flow_step_last_msg` *string*

Default: ""

Specifies the message provided for the last step that was run.

flow_step_last_status

`flow_step_last_status` *string*

Default: `not_run`

Specifies the status for the last flow step run.

flow_step_next

`flow_step_next` *string*

Default: ""

Specifies the next step to run in the flow.

flow_summary_tcl

`flow_summary_tcl` *string*

Default: ""

Specifies the TCL script to run during run_flow summary.

flow_template_feature_definition

`flow_template_feature_definition` *string*

Default: ""

Features list and status for the current template.

flow_template_tools

`flow_template_tools` *string*

Default: ""

Specifies the list of tools included in the flow templates being run.

flow_template_type

`flow_template_type` *string*

Default: ""

Specifies the type of template being run.

flow_template_version

`flow_template_version` *string*

Default: ""

Specifies the version of the template being run.

flow_user_templates

`flow_user_templates` *string*

Default: ""

Specifies the flow user template definitions.

flow_top

`flow_top` *string*

Default: ""

Specifies the flow to be executed by default.

flow_verbose

`flow_verbose` {true | false}

Default: true

Enables printing the run information in the log file.

flow_working_directory

`flow_working_directory` *string*

Default: "."

Specifies the flow directory where the flow is being run.

flow_write_db_snapshot

`flow_write_db_snapshot` {true | false}

Default: true

Data_type: bool, read/write

Creates a snapshot for `write_db` on flow steps, which saves a database.

flow_write_db_snapshot_exclude_time

`flow_write_db_snapshot_exclude_time` {true | false}

Default: true

Data_type: bool, read/write

Marks all snapshots created for the `write_db` command on the flow steps, which save a database as `exclude_time_metric`.

flow_yamllint_exec

`flow_yamllint_exec` *string*

Default: `yamllint`

Specifies where `yamllint` can be found to check the `yaml` syntax.

flowtool Category Attributes

The root attributes in the `flowtool` category are:

- `flowtool_exit_timeout`
- `flowtool_extra_arguments`
- `flowtool_metrics_qor_html`
- `flowtool_metrics_qor_excel`
- `flowtool_metrics_qor_text`
- `flowtool_metrics_qor_vivid`
- `flowtool_predict_full_names`
- `flowtool_schedule_flow_immediate`
- `flowtool_summary_tcl`

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `flowtool` category, use the following command:

```
get_db -category flowtool
```

flowtool_exit_timeout

`flowtool_exit_timeout` *int*

Default: `30`

Data_type: Integer

Specifies the maximum time (in seconds) for which flowtool will wait to complete post exiting from the tool.

flowtool_extra_arguments

`flowtool_extra_arguments` *string*

Default: ""

Data_type: String

Specifies the extra arguments passed to flowtool when running in the tool mode..

flowtool_metrics_qor_html

`flowtool_metrics_qor_html` *string*

Default: ""

Data_type: String

Specifies the metrics file in the HTML format to write after tool's exit.

flowtool_metrics_qor_excel

`flowtool_metrics_qor_excel` *string*

Default: ""

Data_type: String

Specifies the metrics file in the Excel format to write after tool's exit.

flowtool_metrics_qor_text

`flowtool_metrics_qor_text` *string*

Default: ""

Data_type: String

Specifies the metrics file in the txt format to write after tool's exit.

flowtool_metrics_qor_vivid

`flowtool_metrics_qor_vivid` *string*

Default: ""

Data_type: String

Specifies the metrics file to write after the tool's exit.

flowtool_predict_full_names

```
flowtool_predict_full_names {true | false}
```

Default: false

Data_type: Boolean

Shows the `skip_metric` flow name in prediction.

flowtool_schedule_flow_immediate

```
flowtool_schedule_flow_immediate {true | false}
```

Default: false

Data_type: Boolean

When set to `true`, flowtool will start the scheduled flows immediately. When set to `false`, it waits for the software to exit before starting the scheduled flows.

flowtool_summary_tcl

```
flowtool_summary_tcl string
```

Default: puts [report_metric -format text]

Data_type: String

Specifies the TCL script to run during `run_flow` summary.

get_feature

```
get_feature  
[-help]  
[feature]  
[-obj string]
```

Returns the feature for a flow.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>get_feature</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man get_feature</code>
<code>feature</code>	Specifies the name of the feature.
<code>- obj string</code>	Specifies the <code>flow</code> or <code>flow_step</code> to be returned.

See also:

[Flow](#) chapter of the *Tempus Stylus Common UI Migration Guide* document.

get_flow_config

```
get_flow_config
[-help]
key ...
[-quiet]
```

Returns the feature configuration for a flow.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>get_flow_config</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man get_flow_config</code>
key ...	Specifies the key to get configuration value.
-quiet	Suppresses errors in case the key does not exist.

See also:

[Flow](#) chapter of the *Tempus Stylus Common UI Migration Guide* document.

init_flow

init_flow
[-help]

The command processes flow information provided by flowtool to setup and run a provided flow sequence. It outputs the affected flow root attributes, such as:

- init_flow summary
- Flow script: /grid/tfo/vol102/tiq/flow/demo_dtmf/scripts/run_flow.tcl
- Flow: flow:block
- From: prects.block_start
- To: prects.block_finish
- Working directory: /grid/tfo/vol102/tiq/flow/demo_dtmf
- Starting database: /grid/tfo/vol102/tiq/flow/demo_dtmf/dbs/block.fplan.block_finish.enc
- Run tag:
- Branch name:
- Metrics file: /grid/tfo/vol102/tiq/flow/demo_dtmf/flow.metrics
- Status file: /grid/tfo/vol102/tiq/flow/demo_dtmf/flow.status

Parameters

- help	Outputs a brief description that includes type and default information for each <code>init_flow</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man init_flow</code>
-----------	--

See also:

[Flow](#) chapter of the *Tempus Stylus Common UI Migration Guide* document.

is_feature

```
is_feature  
[-help]  
[feature_name]  
[-obj string]
```

Tests if the specified flow feature is defined. The format of this command is similar to that of the `get_feature` command.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>is_feature</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man is_feature</code>
feature_name	Specifies the name of the feature to be tested.
-obj string	Specifies if the <code>flow</code> or <code>flow_step</code> will be returned.

See also:

- `get_feature`
- [Flow](#) chapter of the *Tempus Stylus Common UI Migration Guide* document.

is_flow

```
is_flow  
[-help]  
[-after string]  
[-before string]  
[-hierarchical]  
[-inside string]  
[-quiet]
```

Allows you to query during the execution of a flow for further action.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>is_flow</code> parameter.
-after <i>string</i>	Specifies the current execution after the <code>flow</code> or <code>flow_step</code> object.
-before <i>string</i>	Specifies the current execution before the <code>flow</code> or <code>flow_step</code> object.
-hierarchical	Displays all parent flows.
-inside <i>string</i>	Specifies the current execution within the <code>flow</code> object.
-quiet	Ensures that errors are not reported for missing <code>flow</code> or <code>flow_step</code> objects.

See also:

[Flow](#) chapter of the *Tempus Stylus Common UI Migration Guide* document.

read_flow

```
read_flow
[-help]
filename
[-no_check]
```

Loads the content for the current flow and debugs the flow in the tool. The command accepts single argument as the name of the files that describe the `flow` and `flow_step` objects, as shown below:

```
read_flow scripts/run_flow.tcl
read_flow scripts/flow.yaml
```

This command should not be used for YAML or TCL files, in general. For example, the following command should not be used, in which the `setup.yaml` file is used by the flow, but does not contain flow information:

```
read_flow scripts/setup.yaml
```

Parameters

-help	Outputs a brief description that includes type and default information for each <code>read_flow</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man read_flow.</code>
filename	Specifies the flow script to read.
-no_check	Skips running the <code>yamllint</code> and <code>check_tcl</code> flow checks.

See also:

[Flow](#) chapter of the *Tempus Stylus Common UI Migration Guide* document.

report_flow

report_flow
[-help]

Generates a report with the following information:

- The flow type, section list and generation date of the templates
- The flow step order
- One line for every item in flow_history , indicating the success of that item and the configuration of optional flow features, and any error message

Parameters

- help	Outputs a brief description that includes type and default information for each report_flow parameter. For a detailed description of the command and all of its parameters, use the man command: man report_flow.
-----------	---

Example

Flow Features: low power (optional): prefer_area ccopt Flow Generated: 2013-05-14 14:40 GMT Flow Step Order: init place prects cts postcts postcts_hold signoff				
Step	Status	prefer_area	ccopt	Message
init	success	on	off	
place	success	on	off	
prects	success	on	off	
cts	error	on	off	"Prefer_area" doesn't allow CTS.
cts	success	off	off	

This report indicates:

- The flow was generated with the low_power feature enabled, and the prefer_area and ccopt features optional.
- The init, place and prects steps were run with prefer_area enabled, ccopt disabled, and succeeded.
- The cts step was then run with prefer_area enabled, ccopt disabled, and it failed.
- The cts step was then run with both prefer_area and ccopt disabled, and it succeeded.

There is some overlap between `report_flow` and the summary printed at the end of `run_flow` commands. The difference is that `report_flow` reports information about the entire flow history (since the last `run_flow -reset`, if any), whereas the summary at the end of `run_flow` only includes data about the steps run by that command.

See also:

[Flow](#) chapter of the *Tempus Stylus Common UI Migration Guide* document.

reset_flow

```
reset_flow  
[-help]  
[-all]  
[-edits]  
[-features]  
[-flows]  
[-history]  
[-steps]
```

Resets the content for the current flow in the software by clearing any existing flows, steps, or features. The functionality of the `-history` parameter of this command is equivalent to `run_flow -reset`.

Parameters

-help	Outputs a brief description that includes the type and default information for each <code>reset_flow</code> parameter. For a detailed description of the command and all its parameters, use the <code>man</code> command: <pre>man reset_flow</pre>
-all	Resets all the flows, steps, features, edits, and history set in the software. <i>Data_type</i>: bool, optional
-edits	Resets all the flow edits appended through the <code>edit_flow</code> command. <i>Data_type</i>: bool, optional
-features	Resets all the flow features and associated values. <i>Data_type</i>: bool, optional
-flows	Resets all the flow objects. <i>Data_type</i>: bool, optional
-history	Resets flow history and state of all the attributes (such as <code>flow_step_canonical_current</code>, <code>flow_history</code>, and <code>flow_top</code>). <i>Data_type</i>: bool, optional
-steps	Resets all the <code>flow_step</code> objects. <i>Data_type</i>: bool, optional

See also:

[Flow](#) chapter of the *Innovus Stylus Common UI Migration Guide* document.

run_flow

```
run_flow
[-help]
[-directory string]
[-flow string]
[-from string]
[-no_check]
[-no_summary]
[-predict {summary | tcl}]
[-reset]
[-step string]
[-to string]
[-yaml string]
```

The command runs one or more flow steps by default, in the order specified in a single flow.

If more than one flow is defined, the `run_flow` command must be run with `-flow`. However, if `-step` is used, that step does not have to be part of a flow.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>run_flow</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man run_flow</code>.
<code>-directory</code> <i>string</i>	Specifies the working directory in which to run the flow. If a directory is not specified, the current directory is used. Note: Any relative paths in attributes such as <i>flow_report_directory</i> are relative to this directory.
<code>-flow</code> <i>string</i>	Runs the specified flow (created with the <code>create_flow</code> command). <i>from/to</i> options are based on the flow steps. <i>Default:</i> <code>flow_step_order</code>
<code>-from</code> <i>string</i>	Specifies the name of the step to start from. By default, flow starts from the step immediately after the last successfully run step (determined by examining the value of <i>flow_history</i>), or the first step if that attribute is not set.
<code>-no_check</code>	Skips the error checks prior to running. By default, the checks are run.
<code>-no_summary</code>	Skips the full summary from printing. By default, summary is printed and emailed if <i>flow_mail_to</i> is set.
<code>-predict</code> {summary tcl}	Displays the projected future steps to run honoring the <code>-step</code>, <code>-flow</code>, <code>-from</code>, and <code>-to</code> parameters.
<code>-reset</code>	Before running, clears the flow history. After this, the flow starts from the first step if no explicit <code>-from</code> step is specified.
<code>-step</code> <i>string</i>	Runs just the specified step. This takes priority over <i>from/to</i> options.
<code>-to</code> <i>string</i>	Specifies the name of the step to run to (inclusive; in other words, the named step is executed). By default, runs to the end of the last step in the flow. Must be a step in the flow, later than the <code>-from</code> step (if any).
<code>-yaml</code> <i>string</i>	Specifies the yaml file to source before running the flow.

Examples

- The following command prints the hierarchical list of steps to be run post the specified run:

```
run_flow -from cts.block_start -to cts.schedule_report_cts -predict
```

Following is the output of the above command:

```
Flow steps which would run
```

```
-----
```

```
cts.block_start
```

```
cts.init_innovus
```

```
cts.init_innovus.extra_settings
```

```
cts.add_clock_spec
```

```
cts.add_clock_tree
```

```
cts.add_tieoffs
```

```
cts.block_finish
```

```
cts.schedule_report_cts
```

- The following command prints the list of steps as DPO names to be run post the specified run:

```
run_flow -from cts.block_start -to cts.schedule_report_cts -predict -tcl
```

Following is the output of the above command:

```
flow_step:block_start flow_step:init_innovus flow_step:extra_settings
```

```
flow_step:add_clock_spec flow_step:add_clock_tree flow_step:add_tieoffs
```

```
flow_step:block_finish flow_step:schedule_report_cts
```

See also:

[Flow](#) chapter of the *Tempus Stylus Common UI Migration Guide* document.

schedule_flow

```
schedule_flow  
[-help]  
[-branch string]  
[-db string]  
[-defer]  
[-directory string]  
[-flow string]  
[-include_in_metrics]  
[-no_db]  
[-sync | -no_sync]
```

Schedules a flow to be run after the current flow. The details of scheduled flows are stored in the `flow_schedule` attribute.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>schedule_flow</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man schedule_flow.</code>
<code>-branch string</code>	Specifies the branch for the new flow.
<code>-db string</code>	Specifies the starting database of the flow. If not supplied, the final database of the preceding flow (the one currently running) is used.
<code>-defer</code>	Prevents the scheduled flow from running, until requested.
<code>-directory string</code>	Specifies the working directory to use for the flow. By default, the current directory is used.
<code>-flow string</code>	Specifies the flow to be scheduled.
<code>-include_in_metrics</code>	Includes the flow in the current metric snapshot.
<code>-no_db</code>	When specified, flowtool does not use the database saved at the end of the step as the starting database for this flow.
<code>-no_sync</code>	When specified, flowtool does not wait for this flow to complete before continuing.
<code>-sync</code>	When specified, flowtool waits for all flows in the current branch to complete before starting.

set_feature

```
set_feature  
[-help]  
[feature]  
[-obj string]  
-value string
```

Saves the feature for a flow.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>set_feature</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man set_feature</code>
<i>feature</i>	Specifies the name of the feature.
-obj <i>string</i>	Specifies the <code>flow</code> or <code>flow_step</code> to be saved.
-value <i>string</i>	Specifies the value to set the feature.

See also:

[Flow](#) chapter of the *Tempus Stylus Common UI Migration Guide* document.

set_flow_config

```
set_flow_config
[-help]
key
value ...
```

Saves the feature configuration for a flow.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>set_flow_config</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man set_flow_config</code>
key	Specifies the key to set configuration value.
value ...	Specifies the value to set configuration value.

See also:

[Flow](#) chapter of the *Tempus Stylus Common UI Migration Guide* document.

set_flowkit_read_db_args

```
set_flowkit_read_db_args
[-help]
[-dynamic_view analysis_view]
[-hold_views hold_views]
[-leakage_view analysis_view]
[-lef_files list_of_files]
[-setup_views setup_views]
[{-oa_lib_cell_view {libname cellname viewname}}] [{-no_timing}] [{-no_timing_graph}] [{-
mmmc_file fileName}]
```

Controls the run-time options used by read_db when a flow script is loading flow_starting_db specified by flowtool or used by schedule_db.

Note: This command supports all the parameters supported by read_db.

Parameters

-help	Prints a brief description that includes the type and default information for each set_flowkit_read_db_args parameter. For a detailed description of the command and all of its parameters, use the man command: man set_flowkit_read_db_args
-dynamic_view analysis_view	Specifies the analysis view for the dynamic power analysis.
-hold_views hold_views	Specifies the hold views for loading rather than the active hold views.
-leakage_view analysis_view	Specifies the analysis view for the leakage power analysis.

<code>-lef_files <i>list_of_files</i></code>	Specifies the list of LEF files for loading. Use this option if you want to override the existing LEF files in the design being restored and load different LEF files instead. • This option is intended to allow upgrading to new versions of LEF files that are compatible with the old versions. The list of all LEF files used by this design must be provided. • If any pin locations, cell boundaries, or OBS shapes are changed for used cells, new DRC violations may occur. • If pins are added or removed from used cells, or used cells are removed, fatal errors may occur while loading the netlist. • If the removed pins and cells are unused in the design, warnings or errors may still occur, if any library-specific data was stored for those cells or pins during the design flow (such as <code>dont_touch</code> data).
<code>-mmmc_file <i>fileName</i></code>	Specifies the path name to a Multi-Mode/Multi-Corner (MMMC) configuration file (for example, the same file format used by <code>read_mmmc</code>) to replace the MMMC file saved by <code>write_db</code> (and all the corresponding .lib files, .sdc files, etc. referenced by the MMMC file).

<code>-no_timing</code>	Skips reading of the MMMC file, timing libraries and timing constraints. Note: • Most designs that use LEF rely on the .lib information to define the bus order for MACROs that have bus bit terminals. Therefore, using the <code>-no_timing</code> parameter can result in the connectivity to bus ports of leaf level instances being reversed. When .lib information is not available, the default is for bus ports to be treated as descending (for example, [7:0]). While using Verilog modules or OpenAccess abstract views to define the bus order, the connectivity will still be correct even when <code>-no_timing</code> is specified. • Timing libraries cannot be loaded in the same session after a design is read using the <code>-no_timing</code> option. You must use the <code>set_flowkit_read_db_args</code> command without the <code>-no_timing</code> parameter in a new session to load the design with timing libraries and constraints. • If you save a design after <code>set_flowkit_read_db_args -no_timing</code>, it will not save timing information unless you use <code>set_flowkit_write_db_args -add_ignored_timing</code>.
<code>-no_timing_graph</code>	Skips reading the timing graph even if it was saved to the disk by <code>set_flowkit_write_db_args</code> .
<code>-oa_lib_cell_view {libname cellname viewname}</code>	Specifies the library name, cell name, and view name for reading an OpenAccess DB design.
<code>-setup_views setup_views</code>	Specifies the setup views for loading rather than the setup views active during <code>set_flowkit_write_db_args</code> .

Related Topics

- [read_db](#)
- [set_flowkit_write_db_args](#)
- [Flow](#) chapter of the *Tempus Stylus Common UI Migration Guide* document.

set_flowkit_write_db_args

```
set_flowkit_write_db_args
[-help]
[-add_ignored_timing]
[-def]
[-lib]
[-no_constraint]
[-no_fill]
[-no_pvs_fill]
[-no_wait string]
[-sdc]
[-user_path]
[-verilog]
[{-rc_extract}] [{-timing_graph}] [{-oa_lib_cell_view string}] [{-oa_view string}] [{-
lib_to_ldb}]
```

Allows you to save databases through flowkit in the Open Access format and specify the library/cell/view information. The `set_flowkit_write_db_args` command can be used to extend the options used to save a design on flow-steps, which are marked with `skip_db false`. This command needs to be placed inside the `flowstep body_tcl` of interest since it only affects that `flowstep` and resets back to default state when that step completes. The format of this command is similar to what would be used for `write_design`:

```
create_flow_step -name save {set_flowkit_write_db_args -rc -lib2ldb}
```

This saves a database named `save`, which uses the `-rc` and `-lib2ldb` options for `write_db`. Previous and subsequent flowsteps use default `write_design` options unless overridden using the `set_flowkit_write_db_args` command.

Note: This command supports all the parameters supported by `write_db`.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>set_flowkit_write_db_args</code> parameter.
-------	---

<code>-add_ignored_timing</code>	Copies the old timing data when loaded in physical-only mode. If you use <code>set_flowkit_read_db_args -no_timing</code> to read the DB, the timing data is not loaded. This option allows you to copy the ignored timing data from the original <code>read_db</code> location and add it back during <code>set_flowkit_write_db_args</code> like this: <pre>set_flowkit_read_db_args -no_timing test1 <physical editing commands ...> set_flowkit_write_db_args -add_ignored_timing test2</pre> This usage model is intended to allow faster physical-only editing, like DRC fixing, where the netlist is not modified. If you change the netlist, unpredictable results may occur when reading the <code>test2</code> DB using timing data copied from <code>test1</code>.
<code>-def</code>	Saves a DEF file, in addition to the normal DB files in the DB directory. This parameter is normally not used for flat or block flows and is not used by <code>set_flowkit_read_db_args</code>. It can be useful in a hierarchical flow, where you want to use <code>assemble_design</code> to read only the netlist and the DEF files without opening up each design DB and writing out the Verilog and DEF files separately (see <code>-verilog</code>).
<code>-lib</code>	Resolves symbolic links of the timing lib files and side files. Normally external file references, such as to the LEF, .lib, SDC, files are saved using full path-name, symbolic links to the original files inside a libs sub-directory inside the DB directory. This parameter forces copies of the files rather than symbolic links in the libs sub-directory so there are no external file references. That makes the DB directory much larger, and makes it suitable for sending to a different network where the library and external data files are not available. An OA DB will still have OA library references using the normal <code>cds.lib</code> methodology, but any other external file references will be copied inside the cellview directory.

<code>-lib_to_ldb</code>	Converts the <code>.lib</code> timing libraries referenced in the MMMC file to the <code>.ldb</code> format and writes them in a <code>libs</code> sub-directory inside the output design directory. References to the original <code>.lib</code> files in the MMMC file are changed to the corresponding <code>.ldb</code> files inside the <code>libs</code> sub-directory. This makes the design directory much larger because it has all the timing library data inside it and is not recommended for normal flows. Normally, you should setup <code>.ldb</code> files in an external library directory and have the MMMC files use them directly to avoid this overhead. Using <code>.ldb</code> files will make <code>set_flowkit_read_db_args</code> faster when it reads the library data, so this option is useful for doing “throw-away” debugging experiments that require repeated sessions at the cost of a one-time conversion, and carrying the library data with the design.
<code>-no_constraint</code>	Saves the timing graph data without the SDC constraints data. This parameter requires the <code>-timing_graph</code> parameter and is useful in reducing the disk size, and speeding up <code>set_flowkit_read_db_args</code> and <code>set_flowkit_write_db_args</code>. However, the timing-graph data cannot be loaded by any other release version. Additionally, the timing constraints would be lost without the SDC files, if loaded by a different release version. Note: You can still load the timing-graph with the current release version, and then use <code>set_flowkit_write_db_args</code> without the <code>-no_constraint</code> parameter to regenerate the SDC files from the timing-graph and then use <code>set_flowkit_read_db_args</code> with a later release.
<code>-no_fill</code>	Prevents writing of any metal or via fill shapes inside the database. This is useful during the ECO routing, since the fill data is regenerated anyway. This way, it is not worth saving the current fill data. All the fill data that would go to DEF FILLS section (floating fill data), or the DEF SPECIALNETS section with <code>+ SHAPE FILLWIRE</code> or <code>FILLWIREOPC</code> will be ignored and not written.
<code>-no_pvs_fill</code>	Prevents saving the PVS fill data file. In some PVS flows, a stream (GDS) file from PVS is saved inside the software DB directory. During <code>set_flowkit_read_db_args</code>, this file is not read, but can be optionally loaded or used later in the flow. By default, if the PVS fill file exists, <code>set_flowkit_write_db_args</code> will copy it from the <code>set_flowkit_read_db_args</code> location to the new DB directory. If ECO changes to the current design have made the PVS fill file invalid, use this parameter to stop it from being copied.

<code>-no_wait string</code>	Writes the design in a separate process. You can continue executing new commands simultaneously while the design is being saved. This is useful when you want to save intermediate results without waiting for the save to complete.
<code>-oa_lib_cell_view string</code>	Saves the database to an Open Access library cell view.
<code>-oa_view</code>	Specifies the Open Access view name.
<code>-rc_extract</code>	Writes RC extraction data, including data for incremental extraction. By default, the software does not automatically save RC extraction data to save disk space and run-time. The <code>-rc_extract</code> parameter does not save RC extraction data if the design is not extracted or if <code>extract_rc_engine = pre_route</code> .
<code>-sdc</code>	Saves the timing constraint file even if it is not modified.
<code>-timing_graph</code>	Saves the timing graph data.
<code>-user_path</code>	Saves external file references exactly same as the user entered it.
<code>-verilog</code>	Saves a Verilog file inside the DB directory, in addition to the normal DB files. This parameter is not normally used for flat or block flows. It can be used in a hierarchical flow, where you want to use <code>assemble_design</code> to read only the Verilog and the DEF files without opening up each design DB and writing out the Verilog and DEF files separately.

References

- [write_db](#)

write_flow

```
write_flow
[-help]
[-directory string]
[-out_file string]
[-flow_tcl]
[-flow_yaml]
[-include_state]
[-setup_yaml]
```

Generates a Tcl script that may be sourced to reproduce the current flow. The script includes commands to:

- Set the value of all top-level attributes with non-default values to their current values
- Recreate all flow step objects with their current attributes, aside from those relating to run history (specifically, `run_count` and `status`).

Sourcing this script reproduces (but not runs) the current flow in a fresh session, and forms a user readable and editable record of the flow (compared to the flow data saved in the DB, which should not be read or edited directly).

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>write_flow</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man write_flow</code> .
<code>-directory <i>string</i></code>	Specifies the directory in which all the files need to be written.
<code>-out_file <i>string</i></code>	Specifies the name of the output file to generate.
<code>-flow_tcl</code>	Writes only the <code>flow.tcl</code> file in the directory.
<code>-flow_yaml</code>	Writes only the <code>flow.yaml</code> file in the directory.
<code>-include_state</code>	Writes out the current flow state. This can be used to restore the flow.
<code>-setup_yaml</code>	Writes only the <code>setup.yaml</code> file in the directory.

- `write_flow_template`
- [Flow](#) chapter of the *Tempus Stylus Common UI Migration Guide* document.

write_flow_template

```
write_flow_template
[-help]
[-describe string]
[-directory string]
[-enable_feature string]
[-ip_steps string]
[-list]
[-optional_feature string]
[-tech_steps string]
[-template_file string]
[-tools]
[-type string]
[-user_steps string]
[-version string]
```

Creates a set of template TCL files to be used as the basis for a flow. This command is used at the beginning after which, you can manage the generated and modified files. When invoking the command, you will select the type of flow required (implying a subset of template scripts to include) and the arrangement of sections across generated files.

On completion, a message is given to indicate creation of the flow template in the specified directory.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>write_flow_template</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man write_flow_template.</pre>
<code>-describe <i>string</i></code>	Specifies detailed description of the available flow features. If it matches multiple features, then these features are listed along with a short description for each. If it matches exactly one feature, a full description of this feature is printed. Matching no features results in an error.
<code>-directory <i>string</i></code>	Specifies the name of the directory for saving the generated files. If no directory is specified, the command uses the name <i>flow</i>. If required, the tool appends “_” and an integer to the directory name to avoid overwriting an existing directory. For example, <i>flow_1</i>, <i>flow_2</i> and so on).

<code>-enable_feature string</code>	Specifies a list of flow features that are unconditionally incorporated into the generated scripts.
<code>-ip_steps string</code>	Overlays the contents of the generated <code>flow.yaml</code> file and inserts the specified scripts under the <code>ip_flow_steps</code> flow.
<code>-list</code>	Lists the available flow templates.
<code>-optional_feature string</code>	Specifies a list of flow features that are conditionally incorporated into the generated scripts. Both the enabled and disabled code are included, with conditionals based on a new user attribute.
<code>- tech_steps string</code>	Overlays the contents of the file(s) generated by running the <code>write_flow_template</code> command. The file(s) provided with this parameter are copied into the <code>scripts</code> directory inside a <code>tech</code> sub-folder and appear in <code>tech_flow_steps</code> for the stylus flows.
<code>-template_file string</code>	Specifies the flow template file.
<code>-tools</code>	Returns the list of tools whose scripts should be included in the flow.
<code>-type string</code>	Specifies the type of flow to be used.
<code>- user_steps string</code>	Overlays the contents of the generated <code>flow.yaml</code> file and inserts the specified scripts under the <code>user_flow_steps</code> flow.
<code>-version string</code>	Specifies the version of the flow to be used.

alias

```
alias  
[-help]  
new_cmd  
old_cmd  
[-args {{new old} ...}]
```

Creates command name aliases for Tcl commands, except built-in Tcl commands. This command supports argument name aliases for application commands and procs that use `define_proc` and `define_variables` commands for parsing the arguments.

The argument aliases are private, so these do not display with `-help`, and also do not support partial option completion or matching. However, the command aliases are public, so `<tab>` complete works.

You can use this command to migrate an existing Tcl script when some of the commands or argument names have changed.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>alias</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man alias</code>
<code>new_cmd</code>	Specifies the new command name that is an alias for the existing <code>old_cmd</code> name. It can be the same name as the <code>old_cmd</code> if you only want to create new <code>-arg</code> aliases, and do not need a new command alias.
<code>old_cmd</code>	Specifies the existing old command name.
<code>-args</code> <code>{{new</code> <code>old} ...}</code>	Specifies a list of new and old argument names to create aliases. You can give multiple <code>new</code> names for the same <code>old</code> name. The new aliases are private, and do not show up with <code>-help</code> . You can create more than one alias for the same <code>old</code> name.

Example

The following command adds a new command name alias `new_read_sdf` and some argument name aliases for `read_sdf`:

```
>alias new_read_sdf read_sdf -args {
    {-ignore_error -continue_on_error}
    {-summary -report_summary}
    {-sum -report_summary}
}
```

Then, the following commands

```
>new_read_sdf in.sdf -ignore_error -summary
>new_read_sdf in.sdf -ignore_error -sum
>new_read_s in.sdf -ignore_error -sum
```

would behave the same as

```
>read_sdf in.sdf -continue_on_error -report_summary
```

Note: Tcl partial command matching works if the partial command is unique as shown in the above example, but the alias argument names are private, and will not support partial option matching, or appear in the `-help` output.

Related Commands

- `define_proc`
- `define_variables`

check_ccr

check_ccr
[-help]
ccr_number

Returns 1 if the specified CCR is integrated into this build and 0 if it is not.

- It includes all integrated CCRs that have the `Checked_In` or `Validated` status at the time of the build.
- It only includes master CCRs. Duplicate CCRs are not included.
- It currently lists all CCRs fixed in the current release stream or previous release. For example, checking in release version 16.22, will find all CCRs integrated into 16.10 through 16.22 that are in the current 16.22 release.

Parameters

-help	Prints a brief description that includes type and default information for each <code>check_ccr</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man check_ccr</code>
ccr_number	Specifies the CCR number to check.

Examples

- In the example below, the return value "1" indicates that the CCR 1234567 is integrated into this build.

```
tempus> check_ccr 1234567  
1
```

decrypt

```
decrypt
[-help]
file_name
```

Decrypts and evaluates a Tcl file that was encrypted with the encrypt command.

Parameters

-help	Prints out the command usage.
file_name	Specifies the name of the Tcl file to be decrypted and evaluated. <i>Data_type</i> : string, required

Related Topics

- [encrypt](#)

define_proc

```
define_proc  
[-help]  
proc_name  
arg_list  
proc_body  
[-description proc_help]  
[-extended_help description]  
[-hidden]
```

This command defines a Tcl proc that uses an extended argument syntax to check for legal argument names and legal values. It is a super-set of the functionality supported by `define_proc_arguments`, and `parse_proc_arguments` and easier to use.

The arguments are parsed, and if any errors occur, an error message is written, and a `TCL_ERROR` is returned, so the `proc_body` is not executed. If the arguments are parsed successfully the Tcl vars are set accordingly, and the `proc_body` is executed.

It supports simple types like `int`, `string`, etc., built-in types like `point`, `rect`, and objects like `inst`, `net`, `pin`.

Commands defined with `define_proc` also have the same support as other Tempus commands, including:

- help support (e.g. "`cmd -help`" to see the options, and "`help c*`" would find the command named `cmd`, etc.)
- tab-completion of partial command or option names (e.g. "`cmd<tab>`" or "`cmd -opt<tab>`")
- partial argument name matching is allowed (e.g. "`cmd -opt`" will work if `-opt` only matches one option name prefix like `-opt_test`)
- redirect output to files or Tcl vars using `>` or `>>` (e.g. "`cmd > my_file`", or "`cmd > &my_tcl_var`")

Parameters

<code>arg_list</code>	Defines the argument list of the Tcl procedure in the following format for each argument: <pre>{var default arg_name data_type flags help}</pre> For example <pre>{report_file report.out {-out_file file_name} string optional {The output file for the report} }</pre> In this format: • <code>var</code> is the local Tcl variable to assign, such as <code>report_file</code> in the example above. The value for the argument is assigned to this variable before the body of
-----------------------	---

`define_proc` is invoked.

- *default* is the default value, such as `report.out` in the example above. If the argument is not given, then *var* will be assigned the *default* value. Note, unlike an argument value passed to the command, the type of the default value is not checked.

For example, the following command would set `int_var` to `"no_value"` if `-my_int` is not given. Normally the default value should be a legal int value, but you can use this to check if the argument was given for an optional argument when there is no good default value.

```
{int_var no_value {-my_int int} int optional {int value help  
description}}
```

The default value is ignored if the argument is a required argument (see *flags* below).

- *arg_name* is the argument name with optional value help. Both named `{-opt value}` and unnamed `{value}` arguments are supported.

If the first word starts with a dash, it is a named argument with optional help string. For example, `{-out_file file_name}` will appear in the help output as: `-out_file <file_name>`.

If no help string is given like this:

```
{-out_file}
```

The help output will include the *data_type* like: `-out_file <string>`.

If the first word does not start with a dash, it is an unnamed argument and the first word is used as the help string. For example, `{out_file}` will appear in the help output as: `<out_file>`.

- *data_type* is the argument data type. Many types are supported including simple types, bool type, enum type, built-in types, and object types.
 - These simple types are supported: **int**, **float**, **double**, **string**. They all require an argument value that matches the type (e.g. `-my_int 23`, or `-my_string "my test string"`). **float** and **double** are both allowed, and mean the same thing. For example

```
{int_var 0 {-my_int int} int optional {int value help description}}
```

Note that a integer passed to a float or double type will get a .0 added to the end so it can be passed to `expr` and forced to use floating point arithmetic.

- The **bool** type supports an argument with or without a value. If the *arg_name* definition has a value help string, then a bool value is required, otherwise a

value is not allowed. So, a switch that takes no value would look like:

```
{switch_var false -my_switch bool optional "-my_switch help  
description"}
```

and would be used like this with no value

```
-my_switch
```

The `switch_var` will be set to true if `-my_switch` is given, and set to the default value of false if not given.

A `bool` with a value required, would look like this

```
{bool_var false {-my_bool bool} bool optional "bool with value help  
description"}
```

and would be used like this

```
-my_bool true
```

Any Tcl allowed `bool` value can be used for the input value (e.g. true, false, 1, 0, on, off, etc.) but the `bool_var` will always have either true, false or the *default* value if the argument is not given.

- These built-in types are supported: **point**, **rect**.
 - **point** is exactly two doubles. The input can be either a single list or list of lists style, so both {1.0 2.0} or {{1.0 2.0}} are allowed as input. The `point_var` will always be assigned as a simple list of two values for either type of input. An integer value gets a .0 added, so it can be used in a Tcl expr and forced to be treated as a double. So an input like {1 2} will be assigned to the `point_var` as {1.0 2.0}.
 - **rect** is exactly four doubles. It can be in a single list or list of lists style, so {0 1 2 3}, {{0 1} {2 3}} or {{0 1 2 3}} are allowed. The `rect_var` will always be assigned as a simple list of four values.
- An **enum** type must include the list of legal enum values like this {**enum** val1 val2 ...}. It supports an optional `list_type` of * (a list of 0 or more) or + (a list of 1 or more) as the last enum value. It allows an optional {**hidden** val1 val2 ...} list for hidden enum values. The enum value inputs are case-insensitive, but the return value assigned to `var` is always forced to be all lower-case characters. For example,

```
{sort_var name {-sort} {enum name age {hidden city state} +}  
optional {help description}}
```

would allow `-sort age`, or `-sort "name CITY"`, but would give errors for `-sort ""`, or `-sort abc`.

The help string will show the enum values but not the hidden enum values like this:

```
-sort {name age} # help description (enum+, optional)
```

- An **object** type allows object names and pointers to be passed in as values like this **{object obj_type1 [obj_type2 ...] [list_type]}**. It supports an optional *list_type* of ***** (a list of 0 or more) or **+** (a list of 1 or more) as the last value. If *list_type* is not given, exactly one value is required for input. For example,

```
{driver_var {} {-drivers} {object pin port *} optional {help  
description}}
```

would allow a list of 0 or more pin or port objects for input. The input could be a list of pin or port pointers, or a name-pattern like "i1/p*" that allows ***** and **?** pattern matching. *driver_var* will be assigned a list of pointers of the correct type (or types). So both of these uses would have the same result:

```
-drivers [concat [get_db pins i1/p*] [get_db ports i1/p*]]  
-drivers i1/p*
```

In both cases, all the pins and ports that match i1/p* would be returned as a list of objects and assigned to *driver_var*.

If any objects are passed in that are not pin or port objects, an error will occur during parsing.

If at least one pointer is required (e.g. *list_type* **+** or no *list_type*), and none are matched by the name pattern, an error will occur during parsing.

Design objects like **hinst**, **inst**, **hnet**, **net**, **hpin**, **pin**, **port**, etc and library objects like **base_cell**, **base_pin**, **lib_cell**, **lib_pin**, etc, and technology objects like **layer**, **route_rule**, etc. are supported, but only objects that have a *.name* attribute can use a name-pattern in addition to pointers (e.g. a wire object has no *.name* so it cannot be looked up with a name-pattern). See the Stylus Common UI Database Reference for a list of all the *obj_types*.

- *flags* is list of flags that may be an empty list. The supported flags are
 - **optional** means the argument is optional. If the argument is not given, *var* will be set to the *default* value. Arguments are **optional** by default, so this is mostly to make it easy to see it in the definition. It cannot be combined with **required**.
 - **required** means the argument is required. It is an error to not have the argument.
 - **multiple** means the argument can appear multiple times and *var* will be set to a list of all the values.
 - **hidden** means the argument is not shown in the help output, partial argument name matching will not match it, and <tab> complete will not show it. **hidden**

must be optional, so it cannot be combined with **required**, **required_group**, or **exclusive_required_group** flags.

- **obsolete** means the argument still works but is considered obsolete. It will give a warning message if it is used that the user should stop using this argument to be compatible with future releases. An **obsolete** argument will automatically be **hidden** and cannot be a required argument. See **alias** if you just want to change the *arg_name* to a new *arg_name*.

- **{exclusive_group group_name}** means only one of the arguments can be given from the same *group_name*. For example, only one of -my_int or -my_int2 are allowed:

```
{int_var 0 {-my_int int} int {{exclusive_group group1}} {help for -my_int}}
```

```
{int_var2 0 {-my_int2 int} int {{exclusive_group group1}} {help for -my_int2}}
```

- **{exclusive_required_group group_name}** means exactly one of the arguments must be given from the same *group_name*.
- **{required_group group_name}** means one or more of the arguments must be given from the same *group_name*.
- **{requires arg_name1 [arg_name2 ...]}** means this argument requires all the other arguments in the list. For example both -arg1 and -arg2 are required if -my_int is given.

```
{int_var 0 {-my_int int} int {optional {requires -arg1 -arg2}} {help for -my_int}}
```

- **{alias obsolete_name [warn]}** means an alias of *obsolete_name* to the *arg_name* will be added. If **warn** is given, a warning message will be given if the *obsolete_name* is used telling the user to change to *arg_name*, otherwise *obsolete_name* will behave just like *arg_name*. The *obsolete_name* is not shown in help output. This can be used to migrate users to new argument names, but keep the old name for backward compatibility. For example, to migrate from -old_my_int to -new_my_int you would use this:

```
{int_var 0 {-new_my_int int} int {{alias -old_my_int}} {help for -new_my_int}}
```

- *help* is a help string for the argument, such as "*a file name to read*".

-description
proc_help

Specifies the help description for the defined procedure, shown by "help cmd" or "cmd -help".

<code>-extended_help description</code>	Specifies the extended help description to the procedure. It is printed after <code>-description</code> and <code>arg_list</code> . Shown by "help cmd" or "cmd -help".
<code>-help</code>	Outputs the command usage and a brief description about the command parameters.
<code>-hidden</code>	Makes the procedure hidden and not public. That means <code><tab> complete</code> will not return this proc name, and "info commands *" will not return this proc name. But if you type the full name like "info commands full_cmd_name" it will return the command, or "full_cmd_name -help" will return help for it.
<code>proc_body</code>	Defines the Tcl procedure body that uses var names from <code>arg_list</code> .
<code>proc_name</code>	Specifies the name of the Tcl procedure.

Example

Here is an example of some common usage:

```
define_proc test -description "An example of the extended argument syntax" {
    {out_file "default.out" out_file string optional "The output file name"}
    {my_count 0 {-count num_inputs} int required "The number of inputs"}
    {verbose false -verbose bool optional "Verbose output"}
    {check_err not_set {-check_err bool} bool optional "Override global check
setting"}
    {effort low -effort {enum low medium high} optional "How much effort to
use"}
    {my_insts {} {-insts} {object inst +} optional "One or more insts"}
} {
# Proc body goes here

...
}
```

The above procedure generates the following help output:

```
> test -help
```

An example of the extended argument syntax

```
Usage: test [-help] [<out_file>] [-check_err <bool>] -count <num_inputs> [-effort {low medium
high}] [-verbose]
```

<code>-help</code>	# Prints out the command usage
<code><out_file></code>	# The output file name (string, optional)
<code>-check_err <bool></code>	# Override global check setting (bool, optional)
<code>-count <num_inputs></code>	# The number of inputs (int, required)
<code>-effort {low medium high}</code>	# How much effort to use (enum, optional)
<code>-insts <inst>+</code>	# One or more insts (Iinst)+, optional)
<code>-verbose</code>	# Verbose output (bool, optional)

define_variables

```
define_variables  
[-help]  
name_list  
[-transient | -delete ]
```

Creates Tcl variables in the global namespace if they do not already exist, and adds them to a save list to be saved by `write_db` and restored by `read_db`. The variables will be saved even if the root attribute `write_db_auto_save_user_globals` is false. It can also remove Tcl globals that would be automatically saved if `write_db_auto_save_user_globals` is true. It is intended for Tcl global variables, but it also supports namespace variables.

During `read_db`, the Tcl variables are created if they do not already exist and the value is set. If a namespace variable is given, it will also create the namespace if it does not already exist.

Parameters

-delete	Deletes the Tcl variables and removes them from the save and transient lists. It returns an error if the Tcl variables do not exist.
-help	Outputs a brief description that includes type and default information for each <code>define_variables</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man define_variables</code>
name_list	Specifies a list of Tcl variable names. If the specified Tcl variable does not already exist, it is created and added to a save list of variables to be saved by <code>write_db</code> .
-transient	Adds the Tcl variables to a transient list used by <code>write_db</code> (and removes them from the save list if they are there). The transient list will override the automatic save list created if the root attribute <code>write_db_auto_save_user_globals</code> is true, so the variables will not be saved.

Examples

The following command saves the variables `global1` and `namespace1::var1` with `write_db`:

```
>define_variables {global1 namespace1::var1}
```

delete_dangling_ports

```
delete_dangling_ports
-help
-partition
```

Deletes ports that are disconnected from both the inside and outside of a module, and ports that are connected within the module but disconnected outside the module.

Parameters

-help	Prints a brief description that includes type and default information for each delete_dangling_ports parameter. For a detailed description of the command and all of its parameters, use the man command: man delete_dangling_ports
-partition	Specifies the partition only flag of the type boolean. This is an optional.

delete_floating_constants

delete_floating_constants

-help

Deletes dangling 1'b1s or 1'b0s from the Verilog. They are either dangling nets assigned 1'b1 or 1'b0 or 1'b1/1'b0 connections that are not hierarchically connected to a leaf instance.

Parameters

None

Example

In the code below only BUFX2 is a leaf.

```
//  
// Original Verilog  
module hier4 (A,B);  
  input A;  
  input B;  
  
  BUFX2 u0 (.A(A));  
  BUFX2 u1 (.A(1'b1));  
endmodule  
  
module hier3 ();  
  
  hier4 u0 (.A(1'b1),.B(1'b0));  
  hier4 u1 (.A(1'b0),.B(1'b1));  
endmodule  
  
module hier2 ();  
  
  hier3 u0 ();  
endmodule  
  
module top ();  
  
  // Internal wires  
  wire a;  
  wire b;  
  wire c;  
  wire d;  
  
  assign a = 1'b1 ;  
  assign b = 1'b1 ;  
  assign c = 1'b0 ;
```

```
assign d = 1'b0 ;

hier2 u0 ();
BUFX2 u1 (.A(a));
BUFX2 u2 (.A(c));
endmodule

//
// Verilog after delete_floating_constants is issued

module hier4 ( A, B);
input A;
input B;

BUFX2 u0 (.A(A));
BUFX2 u1 (.A(1'b1));
endmodule

module hier3 ();

hier4 u0 (.A(1'b1));
hier4 u1 (.A(1'b0));
endmodule

module hier2 ();

hier3 u0 ();
endmodule

module top ();

// Internal wires
wire a;
wire c;

assign a = 1'b1 ;
assign c = 1'b0 ;

hier2 u0 ();
BUFX2 u1 (.A(a));
BUFX2 u2 (.A(c));
endmodule
```

deselect_obj

```
deselect_obj  
[-help]  
{[-all ] | [obj_list]}
```

Deselects the object or the list of objects from a set. The object type can be any object type drawn on GUI such as instance wire, via instance.

Parameters

-help	Prints a brief description that includes type and default information for each <code>deselect_obj</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man deselect_obj</code>
-all	Deselects all selected objects.
<i>obj_list</i>	Specifies the list of objects to be deselected.

Example

```
deselect_obj [dbGet -p top.insts.name i1]
```

encrypt

```
encrypt  
[-help]  
input_file_name  
[-pragma]  
[> file]  
[-tcl | -verilog ]
```

Encrypts a file in an nc-protect compatible format.

Parameters

-help	Prints out the command usage.
<i>input_file_name</i>	Specifies the file to be encrypted. <i>Data_type</i> : string, required
> <i>file</i>	Specifies the name of the encrypted file. By default, the encrypted file is printed to standard out (stdout). <i>Data_type</i> : redirect_operator, optional
-pragma	Specifies to only encrypt the text between the protect begin and protect end NC Protect pragmas. Encryption block must start with pragma protect comment. <i>Data_type</i> : bool, optional
-tcl	Specifies that the file to be encrypted is a Tcl file. This is the default option. <i>Data_type</i> : bool, optional
-verilog	Uses Verilog style comments for NC Protect pragmas. <i>Data_type</i> : bool, optional

- [decrypt](#)

eval_legacy

eval_legacy
[-help]
script

Runs a legacy command in the legacy Tcl interpreter. This command is not required in normal usage. However, it may be needed in cases where some legacy usage is not yet available in the Common UI. This command is intended as a temporary workaround as users transition to the Common UI and will be removed in a future release.

You should first check if there is a Common UI equivalent command before using this command by using the `get_common_ui_map` command:

```
>get_common_ui_map <legacyCommand>
```

Most legacy commands are available, but legacy commands that have behavior changes in the Common UI will not work properly (`saveDesign`, `restoreDesign`, `init_design`, `report_timing` etc.).

The legacy commands run in a separate Tcl interpreter, so Tcl variables in the current interpreter are not available. That means the *script* should normally be inside " " rather than { } so Tcl variable substitution occurs in the current interpreter before passing the script to the legacy Tcl interpreter.

Parameters

-help	Outputs a brief description that includes type and default information for each eval_legacy parameter. For a detailed description of the command and all of its parameters, use the man command: man eval_legacy
script	Specifies the name of the legacy script.

Example

The following command runs `setFillerMode` and `addFiller` commands in the legacy Tcl interpreter.

```
set my_prefix fill_  
eval_legacy "setFillerMode -corePrefix $my_prefix"  
eval_legacy "addFiller ..."
```

get_common_ui_map

```
get_common_ui_map  
-help  
legacy_name
```

Provides the mapping of a legacy command and its options in Stylus Common UI.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>get_common_ui_map</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man get_common_ui_map</code>
legacy_name	Specifies the legacy command name or the UDM name.

Examples

- The following command gets the mapping of the `placeDesign` command in Stylus Common UI:

```
get_common_ui_map placeDesign
```

Output:

placeDesign	place_design
-clkGateRecloning	-clock_gate_recloning
-ilm	-ilm
-incremental	-incremental
-noPrePlaceOpt	-no_pre_place_opt
-outDir	-out_dir

get_legacy

```
get_legacy
-help
common_ui_cmd_attr_name
```

Returns the legacy command, legacy Tcl global, or legacy `setXXXMode -option` that corresponds to the specified Stylus Common UI command or root attribute.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>get_legacy_command</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man get_legacy</code>
<code>common_ui_cmd_attr_name</code>	Specifies the Stylus Common UI command name or attribute name. <i>Data_type</i> : string, required

Examples

- The following command returns the `set_ilm_mode` option that corresponds to the Stylus Common UI attribute `ilm_keep_high_fanout_ports`:

```
@tempus 1> get_legacy ilm_keep_high_fanout_ports
Mode option: set_ilm_mode -keepHighFanoutPorts
```
- The following command returns the legacy Tcl global that corresponds to the Stylus Common UI attribute `init_lef_files`:

```
@tempus 2> get_legacy init_lef_files
Tcl global: init_lef_file
```

is_common_ui_mode

is_common_ui_mode
[-help]

Checks if the Stylus Common UI mode is enabled.

Parameters

None

Examples

The following example checks it on the Tempus prompt:

```
tempus> is_common_ui_mode
```

```
1
```

Return value 1 indicates that the Stylus Common UI mode is enabled.

Message Commands

- [get_message](#)
- [report_messages](#)
- [set_message](#)

get_message

```
get_message  
-help  
-id msgID  
[-severity | -limit | -suppress | -count | -short | -long | -on_error | -  
stop_script_limit | -detail ]
```

Returns the limit, severity, or suppression information about a message.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>get_message</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man get_message</code>
<code>-count</code>	Returns the number of times this message has been issued this session.
<code>-detail</code>	Returns the message of specified id.
<code>-id msgID</code>	Specifies a single message ID, in the form "ENCFOO-123".
<code>-limit</code>	Returns the limit for the specified message as an integer. -1 is unlimited. 0 is suppressed.
<code>-long</code>	Returns the long message description, as used for the Description section in " <code>man msgID</code> ".
<code>-on_error</code>	Returns the error action for the specified message.
<code>-severity</code>	Returns the severity, <code>error</code> , <code>warn</code> , <code>info</code> , or <code>default</code> , of the specified message as a string.
<code>-short</code>	Returns the short message description. Equivalent to " <code>help msgID</code> ".
<code>-stop_script_limit</code>	Returns the message limit allowed for every public command. Message limit set as -1 means unlimited.
<code>-suppress</code>	Returns 1 if the message is suppressed, 0 if not suppressed.

Examples

The following commands return the suppression, severity, and limit levels for the message ID `IMPDB-1241`:

- `tempus> get_message -id IMPDB-1241 -suppress`
0
- `tempus> get_message -id IMPDB-1241 -severity`
default
- `tempus> get_message -id IMPDB-1241 -limit`
20

- [set_message](#)

report_messages

```
report_messages
[-help]
[[{-errors | -warnings | -all } [-count ]] | -suppressed] [[-prefix <string> [-detail] [-
summary ]]]
[-detail | -count | -suppressed ] [-summary | -count | -suppressed]
```

Reports the messages that have been issued since the software was launched.

When you run the `report_messages` command without any parameters, it prints a summary table and does not return any Tcl value. However, when you specify a parameter(s), it returns a list a of message IDs.

Parameters

-help	Prints a brief description that includes type and default information for each <code>report_messages</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man report_messages</code>
-all	Returns a list of all issued message IDs as a Tcl result. The result does not include suppressed message IDs.
-count	Returns a count of every message when the <code>-errors</code> , <code>-warnings</code> , or <code>-all</code> parameter is specified.
-detail	Returns a list of detailed message of the specified prefix.
-errors	Returns a list of issued error message IDs as a Tcl result.
-prefix	Returns a list of issued error message IDs matched with the specified prefix as a Tcl result.
-summary	Returns a message summary of the specified prefixes.
- suppressed	Returns a list of suppressed message IDs as a Tcl result.
-warnings	Returns a list of issued warning message IDs as a Tcl result.

Examples

- The following command reports the count of all issued message IDs:

```
report_messages -all -count
```

```
{IMPMSMV-1810 855} {IMPEXT-3570 6} {IMPESI-3140 1} {IMPMF-5054 1} {CHKTIM-4 16} {IMPTCM-6 1} {IMPTCM-46 2} {IMPTCM-48 1} {SPEF-1152 4} {TCLCMD-981 2} {TCLCMD-1110 1} {TCLCMD-1247 1} {TCLCMD-1470 1}
```

- The following command reports the count of all issued warning message IDs:

```
report_messages -count -warnings
```

```
{IMPMSMV-1810 858} {IMPEXT-3570 6} {IMPESI-3140 1} {IMPMF-5054 1} {CHKTIM-4 16} {SPEF-1152 4}
```

- The following command reports a list of suppressed message IDs:

```
report_messages -suppressed
```

```
IMPESI-3086 IMPESI-3188 IMPESI-3194 IMPESI-3199 IMPESI-3198 IMPESI-3197 IMPESI-3196
```

set_message

```
set_message
-help
-id list_of_msgIDs
[-reset_count | -severity {warn error info} | -limit number | -no_limit | -suppress | -
unsuppress | -on_error {msg_only exit stop_script}| -stop_script_limit limitNumber]
```

Specifies to change the message severity levels, `INFO`, `WARNING` or `ERROR`, at the beginning of the message. This command allows you to control the messages that are displayed for a particular design. For example, if there are some warnings that are critical for the design, you can change the message severity to `ERROR`. Similarly, if there are messages that you want to ignore, you can change the message severity to `INFO`.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>set_message</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man set_message</code> .
<code>-id <i>list_of_msgIDs</i></code>	Specifies the list of message IDs that require a change in the message severity level. If you do not specify a message ID, the change in severity level is applied to all message IDs.
<code>-limit <i>number</i></code>	Sets the message limit to <i>number</i> per every public command. The default limit is 20, so any specific message will be written out 20 times for one command and then further output of that message will be disabled (along with an additional message saying the message limit has been exceeded). If the number is set to 0, the message will be completely suppressed for the next public command that triggers the message. You can unsuppress the message by setting the number greater than 0.
<code>-no_limit</code>	Removes any existing limit on the selected messages. Suppressed messages are not unsuppressed.

<code>-on_error {msg_only exit stop_script}</code>	Specifies an extra action for error messages (not for warn or info messages). If no message is specified, the action applies to all error messages. • <code>msg_only</code>: Prints error message only, and the command proceeds as it normally would. This is the default. • <code>exit</code>: Exits immediately and returns to Linux. • <code>stop_script</code>: Waits for the current Tcl command to finish, then stops executing any Tcl script, and returns to the interactive Tcl prompt. If the message severity is changed from <code>error</code> to <code>warn</code> or <code>info</code>, the software will no longer trigger extra action.
<code>-reset_count</code>	Resets the count of the specified message. You can use this option when you want to clear previously generated warnings or errors before beginning the next major step in the design flow.
<code>-severity {warn error info reset}</code>	Specifies the new severity level for the message ID being modified. The <code>reset</code> argument sets the message severity back to its original state.
<code>-stop_script_limit limitNumber</code>	Sets the message limit for a public command. If you set <code>-stop_script_limit</code> for a command as <code>10</code> and message for the command is triggered for the 10th time, the tool will wait for the current Tcl command to finish, then stop executing any Tcl script, and return to the interactive Tcl prompt. The default value of <code>-stop_script_limit</code> is <code>-1</code>, which is unlimited.
<code>-suppress</code>	Suppresses the message.
<code>-unsuppress</code>	Unsuppresses the message.

Examples

- The following command changes the message IMPLF-81 from `ERROR` to `WARN`:
`set_message -id IMPLF-81 -severity warn`
- The following command returns all messages to their original severity:
`set_message -severity reset`
- The following command resets the specified message to its original severity:
`set_message -id ENCLF-18 -severity reset`

Related Information

- [get_message](#)

pop_snapshot_stack

pop_snapshot_stack

Pops the metrics saved since the last push.

The `pop_snapshot_stack` command works in conjunction with `push_snapshot_stack` to create metric hierarchies. Any metrics captured inside a push/pop must be saved via `create_snapshot` (implicit or explicit) or they will be lost.

Parameters

None

Related Information

- `create_snapshot`
- `push_snapshot_stack`

print_message

```
print_message
-help
[ -id msgID | formatString]
[args]
[-error]
[-warning]
```

Generates a message that is included in the `report_messages` output if the message is designated as an error or a warning.

Parameters

<i>args</i>	Specifies the format argument value to print.
<code>-error</code>	Specifies the message is an error. A prefix will be added.
<i>formatString</i>	Specifies the format specifier like <code>sprintf</code> or Tcl's <code>format</code> command.
<code>-help</code>	Prints a brief description that includes the type and default information for each <code>print_message</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man print_message.</pre>
<code>-id msgID</code>	Specifies the message id.
<code>-warning</code>	Specifies that the message is a warning. A prefix will be added.

Examples

The following commands generate an error and a message, which are included in the `report_messages` output:

```
> print_message -error "A test %s." "from the user"
ERROR: (user): A test from the user.
```

```
> print_message -warning "A test %s." "from the user"
WARN: (user): A test from the user.
```

```
> print_message "A test %s." "from the user"
A test from the user.
```

```
> report_messages
*** Summary of all messages that are not suppressed in this session:
Severity      ID      Count      Summary
ERROR        no_id      1          A test %s.
ERROR        user       1          A test %s.
WARN         user       1          A test %s.
*** Message Summary: 1 warning(s), 2 error(s)
```

Related Command

- [report_messages](#)

program Category Attributes

The root attributes in the program category are:

- `cmd_file`
- `log_file`
- `logv_file`
- `program_major_version`
- `program_name`
- `program_short_name`
- `program_version`
- `selected`

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `program` category, use the following command:

```
get_db -category program
```

cmd_file

```
cmd_file fileName
```

Default: ""

Specifies the cmd log file name of the program.

log_file

```
log_file fileName
```

Default: ""

Specifies the log file name of the program.

logv_file

logv_file *fileName*

Default: ""

Specifies the verbose log file name of the program.

program_major_version

program_major_version

Default:

Returns the major version and one digit after the decimal point.

For example, the following command gives the major version of the software:

```
@innovus 1> get_db program_major_version  
20.1
```

program_name

program_name

Default:

Specifies the name of the program.

program_short_name

program_short_name

Default:

Specifies the short name of the program.

program_version

program_version

Default:

Specifies the version of the program.

selected

selected *list*

Default: ""

Specifies the list of currently selected objects. It can be set to a list of objects as long as they are selectable.

push_snapshot_stack

push_snapshot_stack

Creates a hierarchy for metric capture. All metrics captured inside the hierarchy is saved at this level during snapshot creation (implicit or explicit). Snapshot hierarchies can be nested so any number of hierarchies are supported.

Note: Each `push_snapshot_stack` must have a corresponding `pop_snapshot_stack`.

Parameters

None

Related Command

- `pop_snapshot_stack`

rename_obj

```
rename_obj
[-help]
[-escape_ok]
[-flexible]
object
new_name
[-quiet]
```

Renames the `base_name` of a single design object, which could only be a `inst`, `hinst`, `design`, `module`, `port`, `hport`, or `hnet`. This command changes only the `base_name` of the specified objects, and cannot move those across the netlist hierarchy. This command also returns the new name of the renamed object.

The names used for SDC timing constraints can only be modified using this command, if they have been loaded into the memory. So, ensure that all the timing views are loaded using the `set_analysis_view` command before running the `rename_obj` command so that the SDC constraints are updated properly. The modified SDC files can be retrieved after renaming the objects.

The `rename_obj` command cannot update the names used inside a CPF `power_intent` file. This is because the CPF usage assumes that the CPF file is golden and should not be modified. To change the names used inside a CPF file, first update the CPF file manually, and then use the updated CPF file to run the `rename_obj` command.

An IEEE1801 `power_intent` file is allowed to be changed during the design flow. So, changing names using the `rename_obj` command will automatically update the IEEE1801 object names. You can use the `rename_obj` command to write out the new IEEE1801 file with the updated names.

Parameters

<code>-help</code>	Provides a brief description of the command that includes the type and default information for its parameters. For a detailed description of the command and all its parameters, use the <code>man</code> command: <code>man rename_obj</code>
<code>-escape_ok</code>	Allows <code>new_name</code> to have either the hierarchy chars <code>'/'</code> or the bus-bit chars <code>'[]'</code> in it, which will automatically be escaped. If this parameter is not specified, any set of <code>'/'</code> or <code>'[]'</code> chars in <code>new_name</code> will cause an error and the object will not be renamed. <i>Data_type</i> : bool, optional

<code>-flexible</code>	If <code>new_name</code> coincides with an existing name, this parameter appends a suffix (such as <code>_1</code> and <code>_2</code>) to differentiate it. If this parameter is not specified, a name collision in such a scenario causes an error, and the specified object is not renamed. <i>Data_type</i>: bool, optional
<code>object</code>	Specifies the object to be renamed. The object here must be an <code>inst</code>, <code>hinst</code>, <code>design</code>, <code>module</code>, <code>port</code>, <code>hport</code>, or <code>hnet</code>. If <code>object</code> is a <code>port</code> or <code>hport</code>, any <code>hnet</code> connected to it with the same <code>base_name</code> is also renamed to keep it matched (for example, renaming <code>hport:top/i1/clkin</code> also renames <code>hnet:top/i1/clkin</code>). If <code>object</code> is an <code>hnet</code> that is connected to a <code>port</code> or <code>hport</code> with the same <code>base_name</code>, an error occurs. In such a case, you must change the <code>port</code> or <code>hport</code> name to proceed. If an <code>hnet</code> name matches with its associated <code>net</code> name (for example, <code>get_db \$my_hnet .net</code>), then the net name is also renamed on using the <code>rename_obj</code> command. For example, renaming <code>hnet:top/net1</code> also renames <code>net:top/net1</code>. Therefore, to rename a <code>net</code>, you need to rename the <code>hnet</code> with the same name. This command does not allow renaming a bus-bit object. So any <code>port</code>, <code>hport</code>, or <code>hnet</code> that has a <code>.base_name</code> like <code>busA[0]</code> (a bus-bit object), cannot be renamed, While a <code>.base_name</code> with a scalar name (like <code>busA\[0\]</code>) can be changed. <i>Data_type</i>: (<code>inst</code> <code>hInst</code> <code>vCell</code> <code>topCell</code> <code>term</code> <code>hTerm</code> <code>hNet</code>), required
<code>new_name</code>	Specifies the new <code>base_name</code> for the specified object. <i>Data_type</i>: string, optional
<code>-quiet</code>	Suppress messages about renamed objects. <i>Data_type</i>: string, optional

Examples

- The following command renames an `inst` `base_name` to `i2_new`:

```
rename_obj inst:top/i1/i2 i2_new  
inst:top/i1/i2_new          #returned object with new name
```
- The following command renames an `inst` `base_name` `i2\i3` with escaped hierarchy:

```
rename_obj {inst:top/i1/i2\i3} i2/i3_new -escape_ok  
inst:top/i1/i2\i3_new       #returned inst object, no hierarchy change
```
- The following command renames a scalar `hport` name to remove escaped bus-bit chars:

```
rename_obj {hport:top/i1/busA\[0\]} busA_0  
hport:top/i1/busA_0          #returned hport object
```

Note: `hnet:top/i1/busA\[0\]` is also renamed to `hnet:top/i1/busA_0`.
- The following command renames a `port` name:

```
rename_obj port:top/clkin clkin_new  
port:top/i1/clkin_new        #returned port object
```

Note: Both `hnet:top/i1/clkin` and `net:top/i1/clkin` are renamed.

rename_snapshot

```
rename_snapshot  
[-help]  
[-branch newBranch]  
[-id metricID]  
[-name newName]  
-uuid snapshotuuid
```

Allows you to rename existing snapshots.

`rename_snapshot` does not support canonical paths and cannot change the location of a snapshot within the hierarchy.

Parameters

<code>- branch newBranch</code>	Specifies the new branch for the snapshot. <i>Data_type</i> : string, optional
<code>-help</code>	Outputs a brief description that includes type and default information for each <code>rename_snapshot</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man rename_snapshot</code>
<code>-id metricID</code>	Specifies the metric database ID to change. If you do not specify any id, the tool will take current database as default. <i>Data_type</i> : string, optional Note: You can find the uuid of a snapshot by using <code>get_metric</code> for the uuid metric.
<code>-name newName</code>	Specifies the new name for the snapshot. The tool will error out if you set the name to empty string. <i>Data_type</i> : string, optional
<code>-uuid snapshotuuid</code>	Specifies the snapshot UUID. The tool will error out if there is no snapshot with the provided uuid. <i>Data_type</i> : string, required

Related Information

- `get_metric`

report_area

```
report_area
[-help]
[-detail]
[-hierarchical_instance hinst_name]
[-include_physical]
[-min_area area_per_module]
[-min_count instance_count]
[-out_file filename]
[-show_leaf_cells]
[-show_msv_cells]
[-sort_by {name count area}]
[-table_style {horizontal vertical}]
[-summary | -depth depth_of_hierarchy]
```

Reports the combined standard cell area in each of the hierarchy modules and the top-level design. Also reports the cell area based on different cell types if the `-detail` option is specified.

Note: The units used in the report depend on the units used in the library. The area for each module is calculated from all the standard cells within each module using the LEF information.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>report_area</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man report_area</code>
<code>-depth <i>depth_of_hierarchy</i></code>	Specifies the depth of hierarchy, all levels if not specified; the top of the hierarchy (design) is 1.
<code>-detail</code>	Reports the area in different cell type (buffer, inverter, combinational, flop, latch, clock_gate, macro, physical).
<code>-hierarchical_instance <i>hinst_name</i></code>	Reports the area of the leaf instances in the specified hierarchical instance. You can use the <code>-depth</code> parameter to control the analysis depth of the specified hierarchical instance.

<code>-include_physical</code>	Specifies to include physical cells in the area calculation and report. By default, it reports only logical cells.
<code>-min_count instance_count</code>	Specifies the minimum instance count per module. The generated output reports the area of hinsts with number of instances greater than the specified <code>min_count</code> value. <i>Default:</i> 0
<code>-min_area area_per_module</code>	Specifies the minimum area per module. The generated output reports the area of hinsts with area greater than the specified <code>min_area lib_units</code> . <i>Default:</i> 0
<code>-out_file filename</code>	Specifies the name of the output file.
<code>-show_leaf_cells</code>	Specifies to include the leaf cells at the design level and each hinst level. These are the instances whose parent is the hinst display. <i>Default:</i> 0 (Shows the hinst children in the report)
<code>-show_msv_cells</code>	Includes multiple supply voltage cells in the report. Note: This parameter is used with <code>-table_style vertical</code> .
<code>-sort_by {name count area}</code>	Specifies the order of hinst names. <i>Default:</i> name
<code>-summary</code>	Prints the area summary for the design. It is equivalent <code>"-depth 0"</code> .
<code>-table_style {horizontal vertical}</code>	Specifies whether the base report should be expanded in the vertical or horizontal direction. <i>Default:</i> horizontal

Examples

- The following command reports the top-level of the hierarchy (design):

```
report_area -depth 1
```

Hinst Name	Module Name	Inst Count	Total Area

```
-----
dtmf_recvr_core                        8234                207975.789
ARB_INST                             arb                   90                221.578
DATA_SAMPLE_MUX_INST                  data_sample_mux    69                83.790
DIGIT_REG_INST                       digit_reg         11                59.052
```

- The following command reports the cell area based on different cell types along with cell area of the top-level design:

```
report_area -depth 1 -detail
```

Hinst Name	Module Name		Inst Count	Total Area	Buffer	Inverter
Combinational	Flop	Latch	Clock Gate	Macro	Physical

(Leaf Cells)		126	336.756

report_dangling_ports

```
report_dangling_ports  
-help  
-partition  
-out_file fileName
```

Reports ports that are disconnected from both the inside and outside of a module, and ports that are connected within the module but disconnected outside the module.

Note: If the design has some dangling or unconnected ports, the tool will add `FE_UNCONNECTED_*` nets for these dangling or unconnected ports in the design during optimization. You can report these dangling ports using the `report_dangling_ports` command.

Parameters

-help	Prints a brief description that includes type and default information for each <code>report_dangling_ports</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man report_dangling_ports</code>
-out_file	Specifies the name of the report generated by this command.
-partition	The option a partition only flag of the type boolean. This is an optional.

Examples

- The following command writes information about the dangling ports to the `test.rpt` file:

```
report_dangling_ports -out_file test.rpt  
  
Total number of dangling ports: 125
```

- The following command writes information about the dangling ports to the `sample.rpt` file:

```
report_dangling_ports -partition -out_file sample.rpt  
  
Total number of dangling ports: 0
```

report_hidden_usage

report_hidden_usage
in_files

Reports a summary of all the hidden application Tcl globals and mode options in the specified files. Hidden globals and mode options are normally used for temporary fixes or early access, and often disappear or change in a new release. This command will help to find out the hidden settings used in existing scripts that might not be needed in the new release.

Parameters

-help	Outputs a brief description that includes type and default information for each report_hidden_usage parameter. For a detailed description of the command and all of its parameters, use the man command: man report_hidden_usage
in_files	Specifies input files to search for hidden usage.

Examples

- The following command reports the hidden settings in the floorplan.tcl and place.tcl files.

```
>report_hidden_usage {floorplan.tcl cts.tcl} > hidden.rpt

#####

# Generated by:      Cadence Tempus 18.10-a072_1

# Design:            top
# Command:           report_hidden_usage floorplan.tcl cts.tcl > hidden.rpt
#####
```

floorplan.tcl

Line	Hidden name	Command

12	floorplan_xxx	set_db floorplan_xxx true
32	init_xxx	set_db init_xxx 100

cts.tcl

Line	Hidden name	Command

3	cts_xxx	set_db cts_xxx true

report_obj Category Attributes

The root attributes in the `report_obj` category are:

- `report_obj_display_limit`

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `program` category, use the following command:

```
get_db -category program
```

report_obj_display_limit

```
report_obj_display_limit displayLimit
```

Default: 1000

Data_type: int, read/write

Controls the number of objects that will be displayed when using `report_obj`. If the value is 10, 'report_obj insts' will only display 10 instance objects with all their non-default attributes.

resume

```
resume [-help]
```

Resumes a suspended script from the point where it had stopped.

Use the `suspend` and `resume` commands to debug your scripts interactively. The `suspend` command stops a script and restores access to the Tempus prompt. You can then type any command required for debugging. Whenever you want to resume the suspended script, type `resume` at the Tempus prompt.

Parameters

<code>-help</code>	Prints the usage of the <code>resume</code> command. For a detailed description of the command, use the <code>man</code> command: <code>man resume</code> .
--------------------	--

Related Command

- [suspend](#)

select_obj

```
select_obj
[-help]
<any_object>+
```

Selects the object or the list of objects for putting into a set. The object type can be any object type selectable on the GUI such as inst and net.

Parameters

-help	Prints a brief description that includes type and default information for each <code>select_obj</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man select_obj</pre>
<any_object>+	Specifies the list of objects.

Example

```
select_obj [get_db insts i1/*]
```

set_layer_preference

```
set_layer_preference  
[-help]  
layer_name  
[-is_visible {1 | 0}]  
[-is_selectable {1 | 0}]  
[-color {color_name | color_value}]  
[-line_width {lw}]  
[-stipple stipple_name | -stipple_data width height "stipple_data"]
```

Sets a new preference for the specified object or layer.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>set_layer_preference</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man set_layer_preference</pre>
<code>-color</code>	Specifies a color for the object. Specify either a color name or a numeric RGB value.
<code>-is_selectable</code>	Specifies whether the object is selectable. Specify <code>1</code> to make the object selectable. Specify <code>0</code> to make the object non-selectable.
<code>-is_visible</code>	Specifies whether the object is visible. Specify <code>1</code> to make the object visible. Specify <code>0</code> to make the object invisible. Examples - You can turn off the visibility of all custom layers by using the following command: <pre>set_layer_preference customLayers -is_visible 0</pre> - You can turn off display of flightlines by using the following command: <pre>set_layer_preference flightLine -is_visible 0</pre>
<code>layer_name</code>	Specifies the name of the layer or the object type. The valid layer names are <code>M#</code>, where <code>#</code> is <code>0</code> through <code>1</code>, and <code>M#AVio</code>, <code>M#Cont</code>, <code>M#ContPin</code>, <code>M#ContrB</code>, <code>M#Pin</code>, <code>M#RB</code>, <code>M#RTrk</code>, and <code>M#Vio</code>. The valid object types are <code>blackBox</code>, <code>block</code>, <code>blockHalo</code>, <code>bump</code>, <code>bump1</code>, <code>bump2</code>, <code>bump3</code>, <code>cellBlkgObj</code>, <code>channel</code>, <code>clkTree</code>, <code>congest</code>, <code>congestH</code>, <code>congestObj</code>, <code>congestV</code>, <code>datapath</code>, <code>fence</code>, <code>gcellOvflow</code>, <code>guide</code>, <code>hinst</code>, <code>inst</code>, <code>ioSlot</code>, <code>ioRow</code>, <code>macroSitePattern</code>, <code>metalFill</code>, <code>mGrid</code>, <code>net</code>, <code>netRect</code>, <code>nonPrefTrackObj</code>, <code>obstruct</code>, <code>pinObj</code>, <code>pinText</code>, <code>power</code>, <code>powerNet</code>, <code>ptnFeed</code>, <code>ptnPinBlk</code>, <code>pwrDm</code>, <code>pwrDm1</code>, <code>pwrDm2</code>, <code>pwrDm3</code>, <code>layerBlk</code>, <code>region</code>, <code>routeGuide</code>, <code>ruler</code>, <code>screen</code>, <code>select</code>, <code>sitePattern</code>, <code>stdRow</code>, <code>term</code>, <code>text</code>, <code>trackObj</code>, <code>userGrid</code>, and <code>violation</code>.
<code>-line_width</code>	Specifies the number of pixels in the border of the specified object. Specify this value as integer.
<code>-stipple</code>	Specifies information about the stipple pattern of the object. The valid stipple names are <code>None</code> , <code>Horizontal</code> , <code>Vertical</code> , <code>Grid</code> , <code>Slash</code> , <code>Backslash</code> , <code>Cross</code> , and <code>Brick</code> .
<code>-stipple_data</code>	Specifies the stipple information for the object. Specify this information in x-window bitmap format.

Example

The following command sets a layer preference for the module object in green with dotted stipple pattern (8 by 4 bitmap with dot at every 4 pixels):

```
set_layer_preference hinst -color green -stipple_data 8 4 "0x00 0x11 0x00 0x00"
```

set_log_post_cmd

```
set_log_post_cmd  
[-help]  
[-disable command_list]  
[-enable command_list]  
[-report]
```

Turns on/off specific commands post-expansion. It prevents showing lots of `get_db` or `set` commands and cluttering of the log file.

Note: This command does not affect pre-expansion logging.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>set_log_post_cmd</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man set_log_post_cmd</code>
<code>- disable <i>command_list</i></code>	Specifies a a list of command names to not log
<code>-enable <i>command_list</i></code>	Specifies a a list of command names to be logged.
<code>-report</code>	Writes out each disabled commands to stdout. One command is written per line.

set_proc_verbose

```
set_proc_verbose  
[-help]  
{[procedure_name [-quiet ]] | [-report ]}
```

Makes a procedure verbose.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>set_proc_verbose</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man set_proc_verbose</code> .
<i>procedure_name</i>	Specifies the name of the procedure to be made verbose.
-quiet	Changes the procedure back to not being verbose.
-report	Reports procedures that are verbose.

Examples

- The following commands sets `myprocedure` as verbose:

```
> set_proc_verbose myprocedure  
myprocedure
```
- The following commands reports `myprocedure` as the verbose procedure:

```
> set_proc_verbose -report  
myprocedure
```

suspend

suspend [-help]

Suspends your script and returns to the Tempus prompt.

The `suspend` command gives you more flexibility in managing and debugging your scripts. You can insert multiple `suspend` commands in a script. The `suspend` command can also be used in nested scripts. When the script reaches a point where you have inserted the `suspend` command, it stops and restores access to the Tempus prompt. You can then type any command required for debugging.

Whenever you want to resume your script, just type `resume` at the Tempus prompt.

Parameters

-help	Prints the usage of the <code>suspend</code> command. For a detailed description of the command, use the <code>man</code> command: <code>man suspend</code> .
-------	--

Related Command

- `resume`

system Category Attributes

The root attributes in the system category are:

- `auto_file_dir`
- `auto_file_prefix`
- `distributed_mmmc_disable_reports_auto_redirection`
- `gui_verbose`
- `jedai_catalog_token`
- `jedai_catalog_url`
- `log_verbose_type`
- `read_db_directory`
- `read_db_file_check`
- `read_db_stop_at_design_in_memory`
- `read_db_tool_name`
- `read_db_version`
- `resolve_show_tcl_command_with_value`
- `script_search_path`
- `soft_stack_size_limit`
- `source_echo_filename`
- `source_continue_on_error`
- `set_db_verbose`
- `source_verbose`
- `source_verbose_line_length_limit`
- `tcl_error_info`
- `tcl_report_header_with_value`
- `ui_precision`
- `ui_precision_capacitance`
- `ui_precision_derating`
- `ui_precision_power`
- `ui_precision_sensitivities`

- [ui_precision_timing](#)
- [write_db_auto_save_user_globals](#)
- [write_db_restrict_under_batch_mode](#)
- [write_db_restrict_under_eco_batch_mode](#)

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `system` category, use the following command:

```
get_db -category system
```

auto_file_dir

```
auto_file_dir directoryName
```

Default: `./`

Specifies the directory to store files/sub-directories 'auto-generated' by the tool. This includes report files or other output files with default names that are automatically created by some commands in the current run directory. Default names that have been overridden with a name chosen by the user, are not affected. This allows multiple simultaneous runs from the same run directory to direct output files to different result directories to avoid collisions.

auto_file_prefix

```
auto_file_dir fileName
```

Default: `""`

Specifies a prefix to be applied to all files 'auto-generated' by the tool. This includes report files or other output files with default names that are automatically created by some commands in the current run directory. So a default name like "cmd.report" will become "<prefix>cmd.report". Default names that have been overridden with a name chosen by the user, are not affected. This allows multiple simultaneous runs from the same run directory to direct default output files to different locations to avoid collisions.

distributed_mmmc_disable_reports_auto_redirection

```
distributed_mmmc_disable_reports_auto_redirection {true| false}
```

Default: `false`

Allows reports to be generated in the specified location.

When set to `true`, the software does not allow the reports for different views to get overwritten. When set to `false`, the reports are generated automatically in the DMMMC view directory structure.

gui_verbose

```
gui_verbose {all db none}
```

Default: db

Controls which GUI actions are logged. You can select:

- `all`: Logs all GUI actions.
- `db`: Logs the GUI actions that affect the DB, such as `gui_select`, but does not capture display-only actions such as `gui_dim_foreground`.
- `none`: Does not log any GUI actions. So, the `.log` and `.cmd` files are incomplete.

jedai_catalog_token

```
jedai_catalog_token token
```

Default: ""

Data_type: string

Authenticates and provides access to the OpenAI services.

jedai_catalog_url

```
jedai_catalog_url <jedai_server_url>
```

Default: ""

Data_type: string

Enables the AI chat box in the Tempus GUI. You need to set the following setting in `tempus_startup.tcl`.

```
#set server url  
set_db jedai_catalog_url <jedai_server_url>
```

log_verbose_type

```
log_verbose_type {pre post both}
```

Default: pre

When verbose logging is enabled, the default logging of each commands is pre-Tcl expansion. In some cases it is helpful to see post-Tcl expansion, or even both pre-Tcl and post-Tcl expansion when doing detailed debugging. You can switch between settings in the middle of a script.

Related topics

- [set_proc_verbose](#)

read_db_directory

`read_db_directory` *directory_name*

Default: ""

Specifies the absolute path of the database, that is used to restore the session. In case of a non-restored session, this variable returns a blank value.

The value of this global variable is set internally by the software.

read_db_file_check

`read_db_file_check` {true | false}

Default: true

By default, `read_db` will check all the files inside the saved DB directory. If any file is edited, renamed, or deleted, the tool will give an error. However, `read_db` will not perform this check if `read_db_file_check` is set to false.

read_db_stop_at_design_in_memory

`read_db_stop_at_design_in_memory` {true | false}

Default: true

By default, tool gives an error and stops if you call `read_db` more than once in the same session unless `read_db_stop_at_design_in_memory` is set to false. Using `read_db` twice in one session is not recommended as settings from the first database may not be cleaned up properly and can cause problems in the second database.

read_db_tool_name

`read_db_tool_name`

Default: ""

Indicates the tool name of the tool that created the restored db on the disk database.

read_db_version

```
read_db_version
```

Default: ""

Indicates the version of the tool that generates an on disk database.

resolve_show_tcl_command_with_value

```
resolve_show_tcl_command_with_value {true | false}
```

Default: false

Data_type: Boolean, read/write

When set to `true`, it prints the Tcl variable value in the resolve log.

script_search_path

```
script_search_path search_directory_path
```

Default: "."

Provides a set of directories for the software to search for files that are sourced using the Tcl `source` command. The software will search in each search path directory for the specified file.

soft_stack_size_limit

```
soft_stack_size_limit size_limit
```

Default: 8

Specifies the soft stack size limit in mbytes. When the tool is launched, the soft stack size limit is auto-enlarged to 0.2% RAM. If 0.2%RAM is larger than the hard limit, the tool sets it to the hard limit.

source_echo_filename

```
source_echo_filename {true| false}
```

Default: false

Displays the file name being sourced before the actual sourcing.

If this is true, and verbose 'source' command logging is off (e.g. `source_verbose` is false), any 'source' command will be logged with 'Sourcing <filename>'. This can be useful to find which source files are calling other source files, or to log all the startup Tcl files that are loaded even though verbose logging is off.

source_continue_on_error

```
source_continue_on_error {true| false}
```

Default: false

Enables or disables `source` to continue the script on `TCL_ERROR`. If `true`, the `source` command will ignore Tcl errors, and continue processing the script files. If `false`, a Tcl error will halt the script.

set_db_verbose

```
set_db_verbose {true| false}
```

Default: false

Specifies additional messages are issued describing what attribute is being set on what object.

source_verbose

```
source_verbose {true| false}
```

Default: true

Data_type: bool

Controls whether scripts are sourced in quiet or verbose mode:

- By default (`true`), files are sourced in verbose mode. This is equivalent to `source filename -verbose`.
- If you set this variable to `false`, files are sourced in quiet mode.

source_verbose_line_length_limit

```
source_verbose_line_length_limit value
```

Default: -1

Data_type: int

Limits the command printed to stdout and the .log file to the specified number of characters for verbose script source. This is normally only needed if you log commands "post Tcl expansion" when long Tcl lists

may occur in the command arguments.

tcl_error_info

`tcl_error_info {true| false}`

Default: false

Data_type: bool, read/write

When set to `true`, the `tcl_error_info` prints the error information if there is an issue in the Tcl script.

tcl_report_header_with_value

`tcl_report_header_with_value {true| false}`

Default: false

Data_type: boolean, read/write

When set to `true`, prints the Tcl variable value in the report header.

Example

In the following example, `tcl_report_header_with_value` is set to `true`, the report shows the value, `myct`, set for the variable in the report header.

```
[DEV]tempus 8> report_analysis_coverage -check_type  \
+      $myct

#####
#  Generated by:      Cadence Innovus 24.10-dev.jinchuan
#  OS:               Linux x86_64 (Host ID sjfib902)
#  Generated on:      Wed Jan 17 23:22:11 2024
#  Design:           DTMF_CHIP
#  Command:          report_analysis_coverage -check_type  \
#      $myct
#####

+-----+
|          TIMING CHECK COVERAGE SUMMARY          |
+-----+
| Check | No. of |      Met      | Violated | Untested |
| Type  | Checks |              |          |          |
+-----+-----+-----+-----+-----+
| Setup | 1821  | 219 (12%)    | 0 (0%)  | 1602 (87%) |
+-----+-----+-----+-----+-----+
```

If the `tcl_report_header_with_value` is set to `false`, the report will show the name of the variable in the report and not its value.

```
[DEV]tempus 9> report_analysis_coverage -check_type \
+      $myct

#####
```

ui_precision

`ui_precision` *number*

Default: 3

Specifies the number of significant digits to be displayed in the absence of an explicit precision for that type.

ui_precision_capacitance

`ui_precision_capacitance` *number*

Default: 3

Specifies the number of significant digits to be displayed for quantities of type capacitance.

ui_precision_derating

`ui_precision_derating` *number*

Default: 3

Specifies the number of significant digits to be displayed for derating factors such as those specified via `set_timing_derate` constraints or AOCV derating libraries.

ui_precision_power

`ui_precision_power` *number*

Default: 3

Specifies the number of significant digits to be displayed for quantities of type power.

ui_precision_sensitivities

`ui_precision_sensitivities` *number*

Default: 3

Specifies the number of significant digits to be displayed for statistical sensitivity values and SOCV sigma values.

ui_precision_timing

`ui_precision_timing` *number*

Default: 3

Specifies the number of significant digits to be displayed for delay type values including cell and net delays, transitions, arrival and required times, and slacks.

write_db_auto_save_user_globals

`write_db_auto_save_user_globals` {true| false}

Default: true

If true, `write_db` automatically saves the Tcl global variables created by the user. User globals are defined as any “info globals” names that do not exist at startup (such as created by the user executed code).

You can use the `define_variables` command to add or delete specific Tcl variables from the automatic save list.

write_db_restrict_under_batch_mode

`write_db_restrict_under_batch_mode` {0| 1}

Default: 0

Data_type: bool, read/write

Controls whether to save a database under the batch mode. By default, a new database is saved under the batch mode. However, if `write_db_restrict_under_batch_mode` is set to true, the tool gives an error.

write_db_restrict_under_eco_batch_mode

`write_db_restrict_under_eco_batch_mode` {true | false}

Default: false

Data_type: bool, read/write

Controls whether to restrict saving the database in the ECO batch mode.

time_info

```
time_info
[-help]
[stage_name]
[-current]
[-report]
[-stamp]
[-table metric_table_id]
```

Reports and tracks runtime and memory performance.

When the `time_info` command is used without any name, an entry for the stage is created in the table named as "undefined". When the command is used multiple times without any stage name, the stage name is incremented, for example undefined1, undefined2, undefined3. This will ensure that each stage name in the table is unique.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>time_info</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man time_info</code> .
stage_name	Specifies the name of the stage.
-current	Reports the current stage.
-report	Reports all stages up to this point
-stamp	Creates a time stamp.
- table metric_table_id	Specifies metrics table ID to support multiple tables. <i>Default:</i> 'default'

Examples

- The following command shows the usage of the `-current` parameter:

```
tempus > time_info -current
=====
CPU Runtime: 0:00:52.5
Wall Runtime: 0:03:41
Memory Usage: 1387.4 MBytes
Peak Memory Usage: 1505.3 MBytes
Current Time: 12:17:13 (Jul07)
=====
```

- The following command shows the suage of `-report`:

```
tempus > time_info -report

Total Wall | Stage Wall | Wall % | Date - Time      | Memory   | Stage
-----+-----+-----+-----+-----+-----
0:00:00    | 0:00:00    | 0.0%   | 8:27:08 (Jul07)  | 824.3 MB | init
-----+-----+-----+-----+-----+-----

Number of threads: 1 * 1 (id: default)
```

uniquify_filename

uniquify_filename

[-help]

filename

Uniquifies a file.

Parameters

<i>filename</i>	Specifies the name of the file to uniquify.
-help	Prints a brief description that includes type and default information for each <code>uniquify_filename</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man uniquify_filename</pre>

check_netlist

```
check_netlist
-out_file filename
[-sub_module_ports]
```

Performs several checks on the design netlist and creates a report, named `checknetlist.rpt`. This report shows the following information:

- Design Summary
- Design Statistics
- I/O Pad Summary
- Design Rule Checking
- Submodule Port Definition Checking (optional)

The relevant information can be found in the related checklist directory.

You can use this command after the design netlist is imported.

Parameters

<code>-out_file</code> <i>filename</i>	Specifies the name of the file where the report will be written. If a name is not specified, the default filename, <code>checknetlist.rpt</code> , is used.
<code>-</code> <code>sub_module_ports</code>	If this option is included, <code>check_netlist</code> checks the port definitions for any submodules.

Example

- The error conditions are indicated by an asterisk (*) preceding the reported statistic, such as:

```
Number of Ports Connect to Core Cells *: 57
Number of Ports Connect to multiple Pads *: 0
Number of Floating Ports *: 0
```

- The warnings, or possible errors are indicated by a question mark in front of the statistic, such as:

```
Number of undefined Floating Pins ?: 0
```

- The following example shows the information contained in the generated by `check_netlist` report:

```
Design: TOPModule
----- Design Summary:
```

Total Standard Cell Number (cells) : 5908
Total Block Cell Number (cells) : 4
Total I/O Pad Cell Number (cells) : 0
Total Standard Cell Area (um^2) : 133864.32
Total Block Cell Area (um^2) : 366346.56
Total I/O Pad Cell Area (um^2) : 0.00

----- Design Statistics:

Number of Instatnces : 5912
Number of Nets : 6217
Average number of Pins per Net : 3.69
Maximum number of Pins in Net : 541

----- I/O Pad summary

Number of Primary I/O Ports : 57
Number of Input Ports : 28
Number of Output Ports : 29

convert_legacy_to_common_ui

```
convert_legacy_to_common_ui  
[-help]  
in_dir_or_file  
out_dir_or_file
```

Allows usage of legacy scripts to be used in Stylus Common UI.

Parameters

<code>-help</code>	Prints out the command usage.
<code><i>in_dir_or_file</i></code>	Specifies the name of the legacy script or script directory name.
<code><i>out_dir_or_file</i></code>	Specifies the Stylus Common UI script or the script directory name.

create_metric_page

```
create_metric_page  
[-help]  
[-after page_name]  
[-before page_name]  
[-format {html excel text}]  
-name page_name
```

Creates a new metric page.

Parameters

<code>-after <i>page_name</i></code>	Specifies to insert after the page with this name.
<code>-before <i>page_name</i></code>	Specifies to insert before the page with this name.
<code>-format {html excel text}</code>	Specifies configuration for the <code>report_metric</code> format.
<code>-help</code>	Prints out the command usage. For a detailed description of the command, use the man command: <code>man create_metric_page</code>
<code>-name <i>page_name</i></code>	Specifies the name of the new page. The page name must be unique.

Related Command

- `report_metric`

create_metric_table

```
create_metric_table
[-help]
[-auto_hide]
[-collapsible_key]
[-format {html excel text}]
-heading table_heading
[-hide_footers]
[-hide_graph_footers]
[-hierarchy_separator separator]
[-id table_id]
[-key regexp_key]
[-per_snapshot]
[-show_label_every frequency]
-type {horizontal vertical cpu dict time_statement histogram imageplot}
```

Creates a metric table.

Parameters

<code>-auto_hide</code>	Specifies whether to auto hide the table.
<code>-collapsible_key</code>	Specifies to include collapse key columns in the table with the option to expand them.
<code>-format {html excel text}</code>	Specifies configuration for the <code>report_metric</code> format.
<code>-heading heading_id</code>	Specifies the id of the heading to append.
<code>-hide_footers</code>	Hides the minimum, average, and maximum rows from the bottom of the table. Graph buttons are still shown.
<code>-hide_graph_footers</code>	Hides the graph buttons from the bottom of the table.
<code>-hierarchy_separator separator</code>	Shows the metric names with hierarchy using the provided separator.
<code>-id table_id</code>	Specifies the id for the new table.
<code>-key regexp_key</code>	Specifies the key for any regexp.
<code>-per_snapshot</code>	Specifies to expand the table per snapshot.
<code>-show_label_every frequency</code>	Specifies the frequency of X-axis labels in the histogram.
<code>-type {horizontal vertical cpu dict time_statement histogram imageplot}</code>	Specifies the type (horizontal vertical cpu dict time_statement histogram imageplot) of table

Related Topics

- `report_metric` command

create_metric_table_heading

```
create_metric_table_heading
[-help]
[-format {html excel text}]
[-id heading_id]
-page page_name
-title heading_title
[-type {fixed collapse}]
```

Create a new metric heading.

Parameters

-help	Prints out the command usage. For a detailed description of the command, use the man command: <code>man create_metric_table_heading</code>
-format {html excel text}	Specifies configuration for the <code>report_metric</code> format.
-id <i>heading_id</i>	Specifies the id for the new heading.
-page <i>page_name</i>	Specifies the page name where the heading will be added.
-title <i>heading_title</i>	Specifies the title of the heading.
-type {fixed collapse}	Specifies the type of heading element, fixed or collapse.

Related Topics

- `report_metric` command

create_snapshot

```
create_snapshot
-help
[pattern]
[-auto {min default}]
[-categories [* flow design setup power check clock hold route]]
[-exclude_time_metric]
-name metric_name
```

Creates snapshots of the current metric list at various points in the flow.

All super commands that save metrics call `create_snapshot` to save all metrics in a consistent manner. When `create_snapshot` is called, it creates an internal record designated by a label. The label for super commands are the command names.

Metrics that do not require extraction and/or timing/power analysis are calculated when the metric snapshot is saved. Timing/clock/power metrics are reported only if they are up-to-date(i.e. if `time_design/report_ccopt*/report_power` have been run). Metrics are saved as part of db and can be accessed using `get_db`.

Note: Metric values should be saved such that the unit is easily known/accessible.

Parameters

<code>-auto {min default}</code>	Specifies the set of auto metrics to run.
<code>-categories [* flow design setup power check clock hold route]</code>	Specifies the metric categories to compute.
<code>-exclude_time_metric</code>	Excludes CPU and wall time from parent snapshot calculations.
<code>-name <i>metric_name</i></code>	Specifies the name of the metric.
<code>-help</code>	Outputs a brief description that includes type and default information for each <code>set_metric</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man set_metric</code>
<i>pattern</i>	Specifies specific metrics to save.

Example

The following code shows the manual usage of `create_snapshot`:

```
# -----  
# Manual Usage:  
# -----  
  
opt_design -preCTS  
report_power ...  
create_snapshot -label prects  
ccopt_design  
report_power  
create_snapshot -label cts  
add_filler  
route_design  
create_snapshot -label route ; # Timing and power are not up-to-date  
opt_design -postRoute  
report_power  
create_snapshot -label postroute
```

The following code shows the automatic/mixed usage of `create_snapshot`:

```
# -----  
# Automatic / Mixed Usage:  
# -----  
  
setDesignMode -enableMetrics true  
opt_design -preCTS ; # Saves snapshot "opt_design_<count>"  
report_power  
create_snapshot -name "prects"  
ccopt_design ; # Saves snapshot "ccopt_design"  
report_power  
create_snapshot -name "postcts" ; # Includes up-to-date power metrics  
add_filler  
route_design ; # Saves snapshot "route_design"  
opt_design -postRoute ; # Saves snapshot "opt_design_<count>"  
report_power  
create_snapshot -name "postroute" ; # Includes up-to-date power metrics
```

<http://rdwiki.cadence.com/display/ssvpubsmgmt/Parameters+not+Documented+-+16.20>

define_metric

```
define_metric
[-help]
[-compare compareFunction]
[-description metricDescription]
[{-id databaseID}]
[-inheritance_tcl TclName]
-name metric_name
[-no_inheritance]
[-precision number_of_decimal_places]
[-target metric_name]
[-tcl TCL_command_list [-tools listOfTools]]
[-threshold reporting_unit]
[-type metricType]
[-units reporting_unit]
[-warning threshold]
```

Defines new metrics.

You can use this command to create new metrics that you need to track. To create new metrics, you need to provide the TCL code required to generate the metric. The TCL can be a sequence of commands that return a value or a procedure that returns a value.

The following command provides the TCL commands `dbFindInstsByCell HDR*` to define the `design.switch_cells` metric.

```
define_metric -name design.switch_cells -tcl { return [dbFindInstsByCell HDR*] }
```

Similarly, a `proc` can be used to define a metric. The following command provides the `my_get_switch_cells{} proc` to define the `design.switch_cells` metric.

```
define_metric -name design.switch_cells -tcl { return [my_get_switch_cells{}] }
```

The metric is calculated and stored with the other metrics when `create_snapshot` is executed. All `define_metric` commands are saved and restored in the design database.

Parameters

<code>-compare <i>compareFunction</i></code>	Specifies the compare function, <code>[moreBetter lessBetter moreBetterBelowTarget lessBetterA</code> The comparison options show the good or bad color when the below or above the target value as appropriate. <i>Unit:</i> string
--	---

<code>-description <i>metricDescription</i></code>	Specifies the description of the metric. <i>Unit:</i> string
<code>-id <i>databaseID</i></code>	Specifies the database ID.
<code>-inheritance_tcl <i>TclName</i></code>	Specifies Tcl for combining children values. The metric is not in the global namespace. The equivalent proc args is {children}. <i>Unit:</i> string
<code>-name <i>metric_name</i></code>	Specifies the name of the metric. <i>Unit:</i> string
<code>-no_inheritance</code>	Disables the inheritance of the metric. <i>Unit:</i> boolean
<code>-help</code>	Outputs a brief description that includes type and default information for each <code>define_metric</code> parameter. For a detailed description of the command and all of its parameters, run the man command: man define_metric
<code>-precision <i>number_of_decimal_places</i></code>	Specifies the number of decimal places. <i>Unit:</i> integer
<code>-target <i>metric_name</i></code>	Specifies the target or the name of metric containing the target
<code>-tcl {<i>TCL_command_list</i> }</code>	Specifies the list of TCL commands or proc to generate (return value) which is of the format {<value> <unit>}. <i>Unit:</i> string
<code>-threshold <i>reporting_unit</i></code>	Specifies the threshold for comparing numbers in HTML. If the difference between the two numbers being compared is less than the threshold, the metric will be colored "yellow". If it is outside the threshold, it will be colored red or green depending on the compare function i.e. whether more is better or less is better.
<code>-tools <i>listOfTools</i></code>	Specifies the list of tools that the tcl code will run.
<code>-type <i>metricType</i></code>	Specifies the type of metric. <i>Unit:</i> string The various metrics types are: • imageplot: A metric type that renders to an image in the

report.

- **Format:**

```
<name1> { \
    fill_color "<color>" \
    stroke_color "<color>"\
    data <list of data sets>
} \
<name2> { \
    <sub-name1> { \
        fill_color <color> \
        data <list of data sets> \
    } \
    <sub-name2> {...} \
}
```

Where a data set can be one or more of the following:

The data on each layer is a string of coordinates (separate sequences of whitespace and comma) with types. These t

- R - rectangle (x, y, width, height)
- B - bounding box (x_min, y_min, x_max, y_max)
- G - closed polygon (x, y, x, y, ...)
- L - open polyline (x, y, x, y, ...)
- C - circle (x, y, r)
- P - point (x, y)

For rectangles, boxes, circles and points, multiple shapes defined without having to repeat the type letter. e.g. R1,2,3 two rectangles.

A value can be defined for shapes by adding a V suffix to t value can then be used to color the shapes according to th heat maps. The value is always the first number after the ty means that two points with values 20 and 40 may look like 40,6,5 or: PV20,1,2PV40,6,5.

Example imageplot TCL dict data:

```
macros { \
```

```
fill_color "#FF0000" \
stroke_color "#0000FF88" \
data "R5,8,1,2 6,9,2,1 G1,2,3,4,5,6,7,8" \
} \
drcs { \
placement { \
fill_color "#FF0000" \
data "P3,4" \
} \
routing {...} \
}
```

Layers in the image are named (macros, congestion, norm the above example) and support hierarchy. Layers should be nested beyond one level deep. The hierarchy is used in the (see below) to toggle the visibility of the layers. It is an error for a layer to be called data (reserved to keep hierarchy clear).

Colors can be defined either as hex or RGB values with or without opacity. Hex values are prefixed with #. RGB values are separated by whitespace.

- #FF0000: Red
 - #00FF0040: Green (25% opaque)
 - 0 0 255: Blue
 - 255 0 255 192: Magenta (75% opaque)
- histogram: The data will be structured as a set of series with axis labels that are rendered as a stacked histogram.

Format (TCL dict):

```
labels <list of labels> \
axis_x <name> \
axis_y <name> \
series { \
<series1> { \
values <list of buckets> \
color "#FF0000" \
```

```
} \
<series2> { \
  values {2 1 0 0} \
  color "#0000FF" \
} \
}
```

Example:

```
get_metric timing.setup.histogram
timing.setup.histogram {labels {-0.320 -0.240 -0.160
                                series { \
                                  reg2reg {color #FF0000 val
3 0}} \
                                  reg2cgate {color #0000FF v
5 0 0}} \
                                } \
  axis_x WNS(ns) \
  axis_y {Failing End Points}
}
```

The labels (a list of strings, shown in the order provided) define axis labels for the histogram, the values in each series define axis values.

Colors can be defined either as hex or RGB values with or without opacity. Hex values are prefixed with #. RGB values are specified with whitespace.

#FF0000 - Red

0 0 255 - Blue

- **html:** Supports the inclusion of raw HTML in a metric. You can embed simple html into tables allowing simple links to reports. For example, the following command defines `test_html` as an html type of metric.

```
define_metric -name test_html -type html
```

You can use the html metric, `test_html`, using the `set_metric` command.

```
set_metric -name test_html -value {<a href="url":
```

<code>-units <i>reporting_unit</i></code>	Specifies the unit for reporting. <i>Unit:</i> <code>string</code>
<code>-warning <i>threshold</i></code>	Specifies the warning threshold or name of metric containing the value.

Examples

The following command defines the `design.vtmix` metric :

```
define_metric -name design.vtmix -visibility default -tcl {return [TCL commands]}
```

Related Topics

delete_metric

```
delete_metric  
-help  
[{-id databaseID}]  
[-name metric_name]
```

Deletes a previously defined (user) metric from all labels.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>delete_metric</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man delete_metric</code>
- id databaseID	Specifies the database ID.
-name metric_name	Name of the metric to delete.

Examples

- The following command deletes the `design.vtmix` metric:

```
delete_metric -name design.vtmix
```

delete_metric_page

```
delete_metric_page
[-help]
[-format {html excel text}]
-name page_name
```

Deletes a metric page.

Parameters

-help	Prints out the command usage. For a detailed description of the command, use the man command: man delete_metric_page
-format {html excel text}	Specifies configuration for the report_metric format.
-name <i>page_name</i>	Specifies the name of the metric page to be deleted.

Related Topics

- [report_metric](#) command

delete_metric_run

```
delete_metric_run
-help
[-name metric_name]
```

Deletes the specified metric run.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>delete_metric_run</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man delete_metric_run</code>
-name <i>metric_name</i>	Name of the metric run to delete.

delete_metric_table

```
delete_metric_table  
[-help]  
[-format {html excel text}]  
[-id table_id]
```

Deletes a metric table.

Parameters

<code>-help</code>	Prints out the command usage. For a detailed description of the command, use the man command: <code>man delete_metric_table</code>
<code>-format {html excel text}</code>	Specifies configuration for the <code>report_metric</code> format.
<code>-id <i>table_id</i></code>	Specifies the id for the table to be deleted.

Related Topics

- `report_metric` command

delete_metric_table_heading

```
delete_metric_table_heading
[-help]
[-format {html excel text}]
[-id heading_id]
```

Deletes a metric heading.

Parameters

-help	Prints out the command usage. For a detailed description of the command, use the man command: man delete_metric_table_heading
-format {html excel text}	Specifies configuration for the specified report_metric format.
-id <i>heading_id</i>	Specifies the id of the heading to be deleted.

Related Topics

- [report_metric](#) command

get_all_layers

```
get_all_layers
[-help]
[type]
```

Returns a complete list of all layers and floorplan object settings. If you specify type, the software returns all the layers of the specified type. This command can be used at any stage in the design flow.

Parameters

- help	Prints a brief description that includes type and default information for each <code>get_all_layers</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man get_all_layers</pre>
type	Specifies the type of the layer. Tempus supports six types of layers, which can be specified as follows: • <code>object</code>: If you specify type as <code>object</code>, the software returns all object layers, which represent db objects, such as instances, modules, pins, and so on. • <code>display</code>: If you specify type as <code>display</code>, the software returns display-only or view-only layers, including flightlines, rulers, and congestion. • <code>multi</code>: If you specify type as <code>multi</code>, the software returns multiple color layers, such as congestion, maps, and yield map. • <code>metal</code>: If you specify type as <code>metal</code>, the software returns wire/via layers, including metal/via, pin, and blockage. • <code>custom</code>: If you specify type as <code>custom</code>, the software returns custom layers, which are used to represent custom objects and GDSII data. • <code>internal</code>: If you specify type as <code>internal</code>, the software returns all internal layers.

Example

Returns all metal layer names:

```
get_all_layers metal
```

get_metric

```
get_metric  
-help  
[-branch list_of_patterns]  
[-exclude_inherited]  
[-id id_name]  
[-names label_name]  
<pattern>  
[-pending]  
[-pending_top]  
[-raw]
```

Gets the current state of metric(s).

You can use this command to query the current state of any metric or metrics from the current specified list of metrics as well as a previous state.

Parameters

- <i>branch list_of_patterns</i>	Specifies list of patterns to match snapshot branches. This will limit all output to metrics stored in snapshots whose branch matches the specified branch. This requires any inheritance to be re-run to exclude inherited values from non-matching snapshots.
-help	Outputs a brief description that includes type and default information for each <code>get_metric</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man get_metric</code>
-exclude_inherited	Specifies not to return any inherited value.
-id <i>id_name</i>	Name of id (if <code>read_metric</code> was used). Default is current database.
-names <i>label_name</i>	Name of label to get metrics from (wildcards supported); no label reports current metrics
<pattern>	Metric name (wildcards supported); * gets all metrics
-pending	Returns metrics from the pending (not yet created) snapshot.
-pending_top	Returns metrics from the entire pending (not yet created) snapshot stack.
-raw	Returns metrics as raw value (without normalization to defined units).

Examples

- The following command gets all metrics (current behavior):
`get_metric *`
- The following command gets all timing metrics associated with the postcts snapshot:
`get_metric -label postcts timing.*`

Related Commands

- `report_metric`
- `set_metric`

get_metric_alias

```
get_metric_alias  
[-help]  
-from old_name  
[-no_overwrite]  
[-order order_of_priority]  
-to new_name
```

Returns a tcl dictionary of aliases as dictionaries along with the from, to, and order properties.

Parameters

None

Example

- The following command queries the set of aliases:

```
> get_metric_alias
```

Output

```
>path_group:reg2reg {to reg2reg order 1} path_group:reg2cgate {to reg2cgate order 2}
```

Related Commands

- `set_metric_alias`

get_metric_config

```
get_metric_config  
-help  
-format {html excel text}
```

Gets the current metric configuration setting.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>get_metric_config</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man get_metric_config</code>
<code>-format {html excel text}</code>	Specifies configuration for the specified <code>report_metric</code> format.

Related Topics

- `report_metric`
- `write_metric_config`

get_metric_definition

```
get_metric_definition  
-help  
-name metric_name
```

Returns the metric definition of the specified metric.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>get_metric_definition</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man get_metric_definition</code>
-id <i>metricid</i>	Specifies the database ID to output.
-name <i>label_name</i>	Specifies the metric name.

gui_bind_key

```
gui_bind_key  
[-help]  
key  
-cmd cmd  
[-is_public]
```

Enables you to create keyboard shortcuts.

You can use this command at any time after starting Tempus.

Parameters

-help	Prints a brief description that includes type and default information for each <code>gui_bind_key</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man gui_bind_key</pre>
key	Specifies the key to be used as the shortcut. You can specify a: • Single shortcut key-Specify any one of the following keys: ◦ A-Z ◦ Function keys (F1-F12) ◦ Arrow keys ◦ Number keys ◦ Special character keys, such as @ and # ◦ Space, Delete, and Esc keys • Key combination-If you want to use a key combination, specify <code>Shift</code>, <code>Ctrl</code>, or <code>Alt</code> as the first key and any one of the keys allowed as a single shortcut key as the second key in the combination. Examples: ◦ Alt+G ◦ Ctrl+B
-cmd cmd	Specifies the command to be executed when key is pressed.
-is_public	Specifies the bindkey as user defined.

Example

Runs the `gui_fit` command when you press `f` on your keyboard:

```
gui_bind_key f "gui_fit"
```

```
gui_bind_key
```

gui_move_cursor

```
gui_move_cursor  
[-help]  
x y
```

Places the cursor at the specified location in the main window.

You can specify this command at any time after starting the Tempus software.

Parameters

- help	Prints a brief description that includes type and default information for each <code>gui_move_cursor</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man gui_move_cursor</code>
x	Specifies the x coordinate of the cursor location.
y	Specifies the y coordinate of the cursor location.

Example

The following command places the cursor at the coordinates (133, 277).

```
gui_move_cursor 133 277
```

metric Category Attributes

The root attributes in the metric category are:

- `metric_advanced_url_endpoint`
- `metric_capture_3d_hotspots`
- `metric_capture_depth`
- `metric_capture_design_image`
- `metric_capture_design_image_blockages`
- `metric_capture_design_image_blockages_exclude_layers`
- `metric_capture_design_image_blockages_threshold`
- `metric_capture_design_image_power_intent`
- `metric_capture_design_image_route_drc`
- `metric_capture_max_drc_markers`
- `metric_capture_min_count`
- `metric_capture_overwrite`
- `metric_capture_pba_tns_histogram`
- `metric_capture_reg2reg_metrics`
- `metric_capture_timing_analysis_mode`
- `metric_capture_tns_histogram`
- `metric_capture_tns_histogram_buckets`
- `metric_capture_tns_histogram_max_slack`
- `metric_capture_tns_histogram_paths`
- `metric_capture_timing_paths`
- `metric_capture_timing_path_groups`
- `metric_capture_per_view`
- `metric_capture_vth_metrics`
- `metric_capture_vth_per_power_domain`
- `metric_category_default`
- `metric_capture_wns_average_paths`
- `metric_current_run_id`

- [metric_enable](#)
- [metric_summary_metrics](#)

To set the value of any root attribute, use the [set_db](#) command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the [get_db](#) command:

```
get_db attribute_name
```

To get the current value of all attributes in the [metric](#) category, use the following command:

```
get_db -category metric
```

metric_advanced_url_endpoint

```
metric_advanced_url_endpoint base_url
```

Default: ""

Specifies the base URL for the advanced metric server.

metric_capture_3d_hotspots

```
metric_capture_3d_hotspots {true | false}
```

Default: true

Data_type: boolean, read/write

Specifies the depth for capturing hinst design and power metrics.

metric_capture_depth

```
metric_capture_depth integer
```

Default: 1

Specifies the depth for capturing hinst design and power metrics.

metric_capture_design_image

```
metric_capture_design_image {true | false}
```

Default: true

Captures design image.

metric_capture_design_image_blockages

`metric_capture_design_image_blockages {true | false}`

Default: true

Data_type: string, read/write

Captures blockages in the design image.

metric_capture_design_image_blockages_exclude_layers

`metric_capture_design_image_blockages_exclude_layers layer_names`

Default: ""

Data_type: string, read/write

Specifies a list of layers to exclude when capturing the blockage image metric (design.blockage.image). For example, it can be useful for skipping blockages related to metal fill.

metric_capture_design_image_blockages_threshold

`metric_capture_design_image_blockages_threshold thresholdValue`

Default: 100

Data_type: integer, read/write

Threshold for capturing blockages in metric image.

metric_capture_design_image_power_intent

`metric_capture_design_image_power_intent {true | false}`

Default: true

Data_type: string, read/write

Captures power intent objects in the design image.

metric_capture_design_image_route_drc

`metric_capture_design_image_route_drc {true | false}`

Default: true

Data_type: string, read/write

Captures route DRC markers in the design image.

metric_capture_max_drc_markers

`metric_capture_max_drc_markers` *max_number*

Default: 1000

Specifies the maximum number of DRC markers to include in metric image.

metric_capture_min_count

`metric_capture_min_count` *integer*

Default: 1000

Specifies the minimum instance count for capturing hist design and power metrics.

metric_capture_overwrite

`metric_capture_overwrite` {true | false}

Default: false

Overwrite pending metrics during `create_snapshot` category capture.

metric_capture_pba_tns_histogram

`metric_capture_pba_tns_histogram` {true | false}

Default: false

Captures the PBA histogram data for TNS.

metric_capture_reg2reg_metrics

`metric_capture_reg2reg_metrics` [true | false]

Default: false

Data_type: bool, read/write

Forces the capture of reg2reg metrics regardless of path groups.

metric_capture_timing_analysis_mode

`metric_capture_timing_analysis_mode` {gba | ipba}

Default: gba

Data_type: enum, read only

Controls the timing analysis mode for metric capture during create_snapshot categories setup and hold; gba, ipba.

- gba: graph based analysis
- ipba: path based analysis, retime_method == path_slew_propagation, retime_mode == exhaustive, timing_path_based_exhaustive_pba_bounded_mode == true

metric_capture_tns_histogram

metric_capture_tns_histogram {true | false}

Default: true

Captures the histogram data for TNS.

metric_capture_tns_histogram_buckets

metric_capture_tns_histogram_buckets *integer*

Default: 50

Specifies the number of buckets for the TNS histogram.

metric_capture_tns_histogram_max_slack

metric_capture_tns_histogram_max_slack *maximum_slack_value*

Default: 0

Specifies the maximum slack value for the TNS histogram. You can change its value if you need to shift the y axis.

metric_capture_tns_histogram_paths

metric_capture_tns_histogram_paths *integer*

Default: 10000

Specifies the number of paths to capture for the TNS histogram.

metric_capture_timing_paths

metric_capture_timing_paths *integer*

Default: 10

Specifies the number of paths to capture for detailed display.

metric_capture_timing_path_groups

`metric_capture_timing_path_groups` *path_group*

Default: ""

Data_type: string

Controls the path groups for which detailed timing path information (full timing path report and display) is to be captured . By default, it is empty and the tool captures all and reg2reg. If the global is set to a list of groups, the tool will use the listed groups. The related metric name is `timing.setup.paths.path_group:<group>`.

metric_capture_per_view

`metric_capture_per_view` {true | false}

Default: true

Captures timing metrics per analysis_view.

metric_capture_vth_metrics

`metric_capture_vth_metrics` {true | false}

Default: true

Data_type: bool, read/write

Captures vth metrics.

metric_capture_vth_per_power_domain

`metric_capture_vth_per_power_domain` {true | false}

Default: false

Captures vth metrics per power domain.

metric_category_default

`metric_category_default` *category*

Default: design

Specifies to capture the default metric categories if none are provided.

metric_capture_wns_average_paths

`metric_capture_wns_average_paths paths`

Default: ""

Data_type: string, read/write

Specifies a list of integers defining the number of paths to use for average wns metric capture.

Example

The following command:

```
set_db metric_capture_wns_average_paths "100 300 500"
```

Captures the following metrics (in part):

```
timing.setup.wns.avgpath:100.path_group:reg2reg  
timing.setup.wns.avgpath:300.path_group:reg2reg  
timing.setup.wns.avgpath:300.path_group:reg2reg
```

metric_current_run_id

`metric_current_run_id run_id`

Default: ""

Specifies the current unique run ID returned by the advanced metric server.

metric_enable

`metric_enable {true | false}`

Default: false

Specifies the current unique run ID returned by the advanced metric server.

metric_summary_metrics

`metric_summary_metrics {flow.cputime flow.realtime timing.setup.tns timing.setup.wns}`

Default: flow.cputime flow.realtime timing.setup.tns timing.setup.wns

Specifies summary metrics to be inherited when viewing snapshots and runs.

puts

```
puts  
[-help]  
string
```

Outputs information to the screen (stdout) and Tempus log files (.log/.logv).

read_metric

```
read_metric
[-help]
-id snapshotName
<filename>
[-merge]
[-previous UniqueID]
```

Loads a previously saved metric file for querying, reporting, and comparing.

The `read_metric` command allows you to manually load previous saved metrics files into a Tempus session. You can load any number of these files. However, these files should have a unique id.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>read_metric</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man read_metric</code>
-id snapshotName	Specifies the name of snapshot to create or overwrite.
<filename>	Specifies the name of the metrics file.
-merge	Merges the metrics into the named snapshot, instead of replacing.
-previous UniqueID	Specifies the uuid of previous snapshots for the new pending snapshot.

Example

The following code shows the usage of the `read_metric` command along with the `write_metric` command:

```
# -----
# Generate a XML file for all timing, power, and flow metrics from
# from prects to postcts for a previous run (id v101)
# -----
read_metric -id v101 run101/dbs/postcts.enc.dat/design.metrics
```

```
write_metric -id v101 -format xml -labels prects-postcts v101.xml
```

Related Topics

- [report_metric](#)

read_metric_config

```
read_metric_config  
[-help]  
  fileName  
[-format {html excel text}]
```

Reads the YAML file written by the `write_metric_config` command.

Parameters

<i>fileName</i>	Specifies the name to read metric configuration from.
<code>-format {html excel text}</code>	Specifies the configuration for specified <code>report_metric</code> format.
<code>-help</code>	Outputs a brief description that includes type and default information for each <code>read_metric_config</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man read_metric_config</code>

Example

The following example writes the YAML structure in the `text` format in `small.text`, reads the YAML file, and generates the report in the text format.

```
> write_metric -format text small.text ;  
> read_metric_config -format text small.yaml  
> report_metric -format text
```

redirect

```
redirect
[-help]
[file_or_var_name]
[command]
[-bg | -tee]
[-stdin | -append]
[-stderr | -variable]
[-variable]
[-stderr | -stdin]
```

Redirects the output to a file or variable. You can also directly use redirect characters without explicit use of the redirect command for Tempus commands.

Any Tcl return value from *command* is returned by redirect. If redirect is used at the prompt, any echoing of the Tcl return at the prompt is not redirected.

You can also use the `redirect` command to write the contents directly to a gzip compressed file by ending the file name with `.gz`.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>redirect</code> parameter.
<code>file_or_var_name</code>	File or variable name for output to go.
<code>-bg</code>	Runs the commands in a forked process in background. Note: Forking processes have significant impact on memory. Ensure that you have enough memory and do not use this option in a loop. <i>Data_type:</i> bool, optional
<code>command</code>	Command to be executed.
<code>-append</code>	Appends stdout/stderr to file or variable.
<code>-stderr</code>	Redirects stderr.
<code>-stdin</code>	Redirects stdin.
<code>-tee</code>	Redirects output to both screen and file or variable.
<code>-variable</code>	Redirects to a Tcl variable.

It is also possible to use redirect characters similar to Unix usage, for Tempus commands, but not for built-in Tcl commands. This usage works for any Tempus command that does not explicitly register > or

>> as options (if > or >> are visible in the man page or -help output for the command, it is explicitly registered). Note that the "source" command is overlaid by Tempus to add various verbose options, so it also supports these characters.

The table below shows the usage of redirect characters, and how to use & to indicate a Tcl var name.

Redirect Characters	Meaning
> <name>	redirect stdout to the file <name>
>> <name>	redirect stdout and append to the file <name>
> &<name>	redirect stdout to the Tcl var <name>
>> &<name>	redirect stdout and append to the Tcl var <name>

Examples

- `redirect timing.txt "time_design -postRoute"`
Redirects the output to a new file `timing.txt`.
- `redirect test.out.gz "source test.tcl" -append`
Appends the output to the file `test.out.gz` in compressed gzip format.
- `redirect timing.txt "time_design -postRoute" -append -tee`
Redirects the output to both screen and a file.
- `source test.tcl > a.log.gz` #redirect to the file `a.log.gz` in compressed gzip format
- `report_area >> a.log` #redirect and append to the file `a.log`
- `report_area > &a` #redirect to the Tcl var `a`
- `report_area >> &a` #redirect and append to the Tcl var `a`

report_disk

```
report_disk  
[-help]  
[-dir directory_name]
```

Reports the disk metrics of the current working directory and the /tmp directory. The output of this command allows you to investigate Mb/sec throughput of the disk and disk I/O requirements.

This command also reports the used and free disk space for the directory specified by the `-dir` parameter (default is /tmp). When clients are started, it reports disk throughput and space on each client.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>report_disk</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man report_disk</code> .
<code>-dir</code> <i>directory_name</i>	Specifies the name of the directory in which disk metric information is written. The default directory is /tmp.

Examples

- The following is a sample output for `report_disk` before and after starting clients:

```
report_disk  
DISK_INFO : 206.66 Mb/S   381G total   1.1G used   359G free   /tmp  
{206.66 381G 1.1G 359G}  
  
distribute_start_clients -count 2  
INFO: Starting 2 client processes.

report_metric

```
report_metric  
[-help]  
pattern  
-out_file fileName  
-format {html json}  
[-id metricID]  
[-names listOfNames]
```

Allows the user to generate reports in various file formats.

Parameters

<code>-out_file</code> <i>fileName</i>	Specifies the name of the target file.
<code>-format {html json}</code>	Specifies the output type.
<code>-help</code>	Outputs a brief description that includes type and default information for each <code>report_metric</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man report_metric</code>
<code>-id metricID</code>	Specifies the ID of metrics to report.
<code>-names</code> <i>listOfNames</i>	Specifies the list of names. Note: Wildcards are supported.
<i>pattern</i>	Specifies the pattern to match.

report_netlist_statistics

report_netlist_statistics

Reports statistical data of the design netlist such as number of nets, number of IOs, number of pins in the design and number of terms per net(s).

Example

*** Statistics for net list DTMF_CHIP ***

Number of cells = 4263
Number of nets = 4551
Number of tri-nets = 0
Number of degen nets = 21
Number of pins = 16490
Number of i/os = 57

Number of nets with 1 terms = 21 (0.5%)
Number of nets with 2 terms = 2510 (55.2%)
Number of nets with 3 terms = 771 (16.9%)
Number of nets with 4 terms = 510 (11.2%)
Number of nets with 5 terms = 223 (4.9%)
Number of nets with 6 terms = 108 (2.4%)
Number of nets with 7 terms = 76 (1.7%)
Number of nets with 8 terms = 46 (1.0%)
Number of nets with 9 terms = 30 (0.7%)
Number of nets with >=10 terms = 256 (5.6%)

Primitive AOI211X1 (65 insts)
Primitive AOI21X1 (282 insts)

report_obj

```
report_obj  
[<start> [<pattern>]]  
[-all | [-computed] | [-selected]]  
[-help]  
[-categories list_of_categories]  
[-file fileName]  
[-index index_name index_value ...]  
[-tabular]  
[-set_by_user | -read_only ]  
[-tcl | -verbose]
```

Creates a report about the attributes for a given pattern/category/object. This command is mainly intended for root attributes but can be used for any object.

The default output reports those attributes that are set to non-default values and are not computed. This makes it easy to see any changes that were made in the run scripts.

You can also add more attributes or filter out some attributes using various parameters below.

Parameters

<code>-help</code>	Prints a brief description that includes the type and default information for each system root attribute.
<code>-all</code>	Reports all non-computed attributes and their current value, even if the current value matches the default value.
<code>-categories <i>list_of_categories</i></code>	Reports only those attributes that are in the given categories. Wildcards <code>*</code> and <code>?</code> are allowed. Attributes that do not have a category are assigned the reserved category name <code>NULL</code> . The report puts all the attributes in a category together.
<code>-computed</code>	Includes attributes that are computed (for example <code>is_computed == true</code>). By default, the computed attributes are not included. If the data is not computed, this parameter triggers building the timing graph, and so on, that may take significant run time. This parameter can be used with <code>-all</code> .
<code>-file <i>fileName</i></code>	Specifies the output file name.
<code>- <i>index index_name index_value ...</i></code>	Specifies the list of indices in a form of object pointers or pairs of <i>obj_type object_name</i> , for example. <code>'-index {view view1}'</code> or <code>'-index \$obj'</code> .
<code><pattern></code>	Returns all the attribute names that match the specified <code><pattern></code> using the <code>*</code> and <code>?</code> wildcards. The <code><start></code> value is required before the <code><pattern></code> value. <i>Default:</i> <code>*</code>
<code>-read_only</code>	Reports attributes with <code>.is_settable = false</code> .
<code>-set_by_user</code>	Reports the options set by the user.
<code><start></code>	Returns attributes for the objects in the <code><start></code> list. <i>Default:</i> <code>root</code>
<code>-selected</code>	Reports attributes for only selected objects. This parameter cannot be used with <code>-all</code> .
<code>-tabular</code>	Reports attributes details in a table.
<code>-tcl</code>	Returns the objects and their values in a TCL style list, which is a list of keyword-value pairs.
<code>-verbose</code>	Returns the object's data type and default value. This parameter cannot be used with the <code>-tcl</code> parameter.

Examples

- The following command displays the root attributes for the `timing` category that are not computed, and do not match the default value with their current values:

```
report_obj -categories timing -all

*****
***** Object:
root:*****
*****

===== Category:
timing=====

Attribute Name                                     Current Value

reset_metric_config

reset_metric_config

Removes all metric configuration.

Parameters

None

Related Topics

- [get_metric_config](#)
- [read_metric_config](#)
- [write_metric_config](#)

reset_metric_run_id

reset_metric_run_id

Clears the run ID and the related data from the current state so that other commands do not add snapshots to the original reference run in AUM.

Parameters

None

run_metric_category

```
run_metric_category  
[-help]  
-category category_name
```

Runs the specified category.

Parameters

-help	Describes the command usage.
- <i>category category_name</i>	Specifies the name of the category, such as design, setup, hold, clock, power, route, check, flow, to be run. Each category updates the metric associated with that category.

set_compress_level

set_compress_level *compression_level*

Specifies the compression speed to use when compressing large data files. A faster compression speed creates a less compressed file. A slower compression speed creates a more compressed file. By default, the software uses the `gzip` default speed `compression_level`.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>set_compress_level</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man set_compress_level</code>
<code>compression_level</code>	Specifies the speed level to use when compressing files. You can specify a <code>compression_level</code> between 1 and 9, where: 1 Performs the quickest compression, and least compressed files. 9 Performs the slowest compression, and most compressed files. Note: To return to the <code>gzip</code> default <code>compression_level</code> (<code>Z_DEFAULT_COMPRESSION</code>), specify <code>-1</code>.

set_license_check

```
set_license_check  
[-help]  
[-checkout lic]  
[-default]  
[-option_list "lic1 lic2 ..."]  
[-server_license_report]  
[-status_report]  
[-wait_time t]
```

Manages licenses for product options. Specifies licenses to check out, license wait time, and the status of all product option licenses.

Note: This command does not manage multi-CPU licenses. For information on the commands that manage multi-CPU licenses, see the "*Multiple-CPU Processing Commands*" chapter.

Parameters

<code>-help</code>	Prints out the command usage.
<code>-checkout <i>lic</i></code>	Checks out the licenses for the specified product options when this command runs.
<code>-default</code>	Restores the default. values for this command.
<code>-option_list "<i>lic1</i> <i>lic2</i> ..."</code>	Specifies licenses to check out dynamically. Dynamic licenses are not checked out until they are needed. If you specify a license that is not allowed with your base license, or a license that is not available, the software does not check out that license and instead issues a warning message. If you specify more than one license, begin and end the option list with double quotation marks or braces.
<code>- server_license_report</code>	Prints out all the licenses that exist on the license server.
<code>-status_report</code>	Reports the current status of all licenses and the specified wait time. Outputs the following information: • The name of the base license that is checked out • The current wait time • A list of the allowed license options • A list of the available license options • A list of the currently checked-out license options.
<code>-wait_time <i>t</i></code>	Allows the software to wait for up to <i>t</i> minutes when checking-out an optional license. If the license is available in less than the specified wait time, the system checks out the next needed license without waiting. <i>Default:</i> 0 (no wait time) <i>Value range:</i> 0 to 10,000

Examples

- The following command specifies that licenses for Tempus-L and Tempus-XL may be checked out. Tempus-L licenses are checked out before Tempus-XL licenses.

```
set_license_check -option_list {tpsl tpsxl}
```

- The following command sets the wait time to 5 minutes:

```
set_license_check -wait 5
```

set_limited_access_feature

```
set_limited_access_feature
[-help]
featureName
{1 | 0}
```

Enables or disables a limited access feature.

The Tempus software provides certain limited access features that showcase advanced technology integrated into the software. These features have been internally qualified at Cadence but have had only limited customer testing.

Note: Limited access features are enabled by a variable specified through the `set_limited_access_feature` command. To use the limited access features, contact your Cadence representative to qualify your usage, and to make sure that your requirements are met before deploying a feature widely.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>set_limited_access_feature</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man set_limited_access_feature</code>
<code>featureName</code>	Specifies the name of the variable that enables the limited access feature.
<code>{1 0}</code>	Enables/disables a feature - <code>1</code> enables a feature, <code>0</code> disables a feature.

set_metric

```
set_metric  
-name metric_name  
-help  
-value metric_value
```

Sets any defined metric to a value.

Parameters

-name <i>metric_name</i>	Specifies the name of the metric.
-help	Outputs a brief description that includes type and default information for each <code>set_metric</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man set_metric</code>
- value <i>metric_value</i>	Specifies the value of the metric.

Examples

The following command sets the value `dbFindInstsByCell HDR*` to the metric `design.switch_cells`.

```
set_metric -name design.switch_cells [dbFindInstsByCell HDR*]
```

set_metric_alias

```
set_metric_alias
[-help]
-from old_name
[-no_overwrite]
[-order order_of_priority]
-to new_name
```

Renames a metric name, prefixed with the name of a layer, analysis view, path group etc, to another name. For example, you can rename `path_group:reg2reg` to `reg2reg` using the `set_metric_alias` command.

Parameters

-from <i>old_name</i>	Specifies the metric object name to be changed.
-help	Outputs a brief description that includes type and default information for each <code>set_metric_alias</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man set_metric_alias</code> .
-no_overwrite	Specifies to not overwrite an already set alias.
-order <i>order_of_priority</i>	Specifies the order of priority of metric object in tables.
-to <i>new_name</i>	Specifies the new name for the metric object.

Example

- The following command renames `path_group:reg2reg` to `reg2reg` with priority order 1.

```
> set_metric_alias -from path_group:reg2reg -to reg2reg -order 1
```

- The following command renames `path_group:reg2cgate` to `reg2cgate` with priority order 2.

```
> set_metric_alias -from path_group:reg2cgate -to reg2cgate -order 2
```

- The following command queries the set of aliases:

```
> get_metric_alias
```

Output

```
>path_group:reg2reg {to reg2reg order 1} path_group:reg2cgate {to reg2cgate order 2}
```

- [get_metric_alias](#)

set_metric_header

```
set_metric_header  
[-id db_id]  
-name header_name  
-help  
-value header_value
```

Sets the name of a metric header.

Parameters

-id <i>db_id</i>	Specifies the database ID.
-name <i>header_name</i>	Specifies the name of the header.
-help	Outputs a brief description that includes type and default information for each <code>set_metric_header</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man set_metric_header</code>
- value <i>header_value</i>	Specifies the value of the header.

set_preference

```
set_preference  
[-help]  
preference_name  
value
```

Defines preferences, such as, commands issued during a session can be logged to a log or the screen.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>set_preference</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man set_preference</code>.
<code>preference_name</code>	Specifies the name of the preference variables that you want to set. To view preferences in the Tempus GUI, select View - Set Preferences from the main menu. For more details, refer to the "Set Preferences" section of the <i>Tempus Menu Reference</i> guide.
<code>value</code>	The value for the preference. For example, the <code>CmdLogMode</code> preference has the following values. 0--write to command only 1--write to command and log (default) 2--write to command, log, and screen When writing to a log and screen, the commands are preceded by <code><CMD></code>.

Preference Variables

For a complete list of preference variables that you can set using the `set_preference` command and their GUI equivalent in the Preferences form.

Examples

The following command writes log to command, log, and screen:

```
tempus > set_preference CmdLogMode 2
```

Related Topics

For more information on setting preferences from the GUI, see:

- The Preferences form in the "Tools Menu" chapter in the *Tempus Menu Reference*.

Related Commands

- `get_preference`

source

```
source  
[-help]  
filename  
[-quiet | verbose]  
[-quiet | -echo ]
```

Reads a file and executes the commands in the file (scripts).

Parameters

-help	Describes the command usage.
-echo	Enables verbose source. If -echo is specified, the tool will ignore it and continue with the source instead of giving an error. Note: This is optional.
<i>filename</i>	Specifies the name of the file to source.
-quiet	Forces source to be normal Tcl source command. Note: This is optional.
-verbose	Forces source to be in verbose mode. Note: This is optional.

update_inst_name

```
update_inst_name  
-inst instName  
-new_base_name baseName
```

Changes the base name of the specified instance to the given base name.

Note: The `update_inst_name` command does not change the path of hierarchy.

Parameters

<code>-inst <i>instName</i></code>	Specifies the name of the instance.
<code>-new_base_name <i>baseName</i></code>	Specifies the new name for the instance.

Example

The following example changes the instance name from `h3/inv3` to `h3/h2/inv1`:

```
update_inst_name -inst h3/inv3 -new_base_name h2/inv1
```

update_metric

```
update_metric  
[-help]  
[-format {html excel text}]  
[-graph_type {treemap line none}]  
[-group group_title]  
[-header header_name]  
[-link_file_metric metric_name]  
[-link_table table]  
[-metric metric_name]  
[-no_shared_max]  
[-renderer html_format]  
[-show_graph]  
-table table_id  
[-title html_table_title]
```

Updates a metric.

Parameters

<code>-format {html excel text}</code>	Specifies configuration for the specified <code>report_metric</code> format.
<code>-graph_type {treemap line none}</code>	Specifies the type of graph to use in the table (treemap line none). <i>Default:</i> line
<code>-group group_title</code>	Specifies the group title to be used in the html table.
<code>-header header_name</code>	Specifies the header name to be added.
<code>-help</code>	Prints out the command usage. For a detailed description of the command, use the <code>man</code> command: <code>man update_metric</code>
<code>-metric metric_name</code>	Specifies the metric name to be added.
<code>-no_shared_max</code>	When specified for a <code>-renderer</code> histogram metric, the Y axis of all the histograms in a single column stop sharing the same max Y value.
<code>-link_file_metric metric_name</code>	Specifies the name of the metric containing filename to open when the metric value is clicked.
<code>-link_table table</code>	Specifies the table to scroll to when the metric value is clicked.
<code>-renderer html_format</code>	Forces a specific html format renderer for the histogram metric.
<code>-show_graph</code>	Specifies whether to show this metric in a comparison graph.
<code>-table table_id</code>	Specifies the id of table to which the metric will be added.
<code>-title html_table_title</code>	Specifies the title to be used in the html table.

update_metric_definition

```
update_metric_definition
[-help]
[-compare compareFunction]
[-description metricDescription]
[{-id databaseID}]
[-inheritance_tcl TclName]
-name metric_name
[-no_inheritance]
[-precision number_of_decimal_places]
[-target metric_name]
[-tcl {TCL_command_list}[-tools listOfTools]]
[-threshold reporting_unit]
[-type metricType]
[-units reporting_unit]
[-warning threshold]
```

Updates the specified properties of an already-existing metric definition with the same name.

Note: If a metric does not exist with the name, the command returns an error.

Parameters

Specifies the list of tools in which the tcl code will run. *Data_type*: string, optional

-compare <i>compareFunction</i>	Specifies the compare function, [moreBetter lessBetter moreBetterBelowTarget lessBetterA The comparison options show the good or bad color when the below or above the target value as appropriate. <i>Unit:</i> string
-description <i>metricDescription</i>	Specifies the description of the metric. <i>Unit:</i> string
-id <i>databaseID</i>	Specifies the database ID. <i>Unit:</i> string
-inheritance_tcl <i>TclName</i>	Specifies Tcl for combining children values. The metric is not e the global namespace. The equivalent proc args is {children}. <i>Unit:</i> string

<code>-name <i>metric_name</i></code>	Specifies the name of the metric. <i>Unit:</i> string
<code>-no_inheritance</code>	Disables the inheritance of the metric. <i>Unit:</i> boolean
<code>-help</code>	Outputs a brief description that includes type and default infor each <code>update_metric_definition</code> parameter. For a detailed description of the command and all of its param the man command: man update_metric_definition
<code>-precision <i>number_of_decimal_places</i></code>	Specifies the number of decimal places. <i>Unit:</i> integer
<code>-target <i>metric_name</i></code>	Specifies the target or the name of metric containing the target
<code>-tcl { <i>TCL_command_list</i> }</code>	Specifies the list of TCL commands or proc to generate (return which is of the format {<value> <unit>}. <i>Unit:</i> string
<code>-threshold <i>reporting_unit</i></code>	Specifies the threshold for comparing numbers in HTML. If the between the two numbers being compared is less than the thr the metric will be colored “yellow”. If it is outside the threshold colored red or green depending on the compare function i.e. w is better or less is better.
<code>-tools <i>listOfTools</i></code>	Specifies the list of tools in which the tcl code will run. <i>Unit:</i> string
<code>-type <i>metricType</i></code>	Specifies the type of metric. <i>Unit:</i> string The various metrics types are: • imageplot: A metric type that the renders to an image in the report. • Format: <pre> <name1> { \ fill_color "<color>" \ stroke_color "<color>"\ </pre>

```
data <list of data sets>
} \
<name2> { \
  <sub-name1> { \
    fill_color <color> \
    data <list of data sets> \
  } \
  <sub-name2> {...} \
}
```

Where a data set can be one or more of the following:

The data on each layer is a string of coordinates (separate sequences of whitespace and comma) with types. These t

- R - rectangle (x, y, width, height)
- B - bounding box (x_min, y_min, x_max, y_max)
- G - closed polygon (x, y, x, y, ...)
- L - open polyline (x, y, x, y, ...)
- C - circle (x, y, r)
- P - point (x, y)

For rectangles, boxes, circles and points, multiple shapes defined without having to repeat the type letter. e.g. R1,2,3 two rectangles.

A value can be defined for shapes by adding a V suffix to t value can then be used to color the shapes according to th heat maps. The value is always the first number after the t means that two points with values 20 and 40 may look like 40,6,5 or: PV20,1,2PV40,6,5.

Example imageplot TCL dict data:

```
macros { \
  fill_color "#FF0000" \
  stroke_color "#0000FF88" \
  data "R5,8,1,2 6,9,2,1 G1,2,3,4,5,6,7,8" \
} \
drcs { \
```

```
placement { \
    fill_color "#FF0000" \
    data "P3,4" \
} \
routing {...} \
}
```

Layers in the image are named (macros, congestion, norm the above example) and support hierarchy. Layers should be nested beyond one level deep. The hierarchy is used in the (see below) to toggle the visibility of the layers. It is an error layer to be called data (reserved to keep hierarchy clear).

Colors can be defined either as hex or RGB values with or without opacity. Hex values are prefixed with #. RGB values are separated by whitespace.

- #FF0000: Red
 - #00FF0040: Green (25% opaque)
 - 0 0 255: Blue
 - 255 0 255 192: Magenta (75% opaque)
- histogram: The data will be structured as a set of series with axis labels that are rendered as a stacked histogram.

Format (TCL dict):

```
labels <list of labels> \
axis_x <name> \
axis_y <name> \
series { \
  <series1> { \
    values <list of buckets> \
    color "#FF0000" \
  } \
  <series2> { \
    values {2 1 0 0} \
    color "#0000FF" \
  } \
}
```

	<pre>} Example: get_metric timing.setup.histogram timing.setup.histogram {labels {-0.320 -0.240 -0.160 series { \ reg2reg {color #FF0000 val 3 0}} \ reg2cgate {color #0000FF v 5 0 0}} \ } \ axis_x WNS(ns) \ axis_y {Failing End Points} } }</pre> The labels (a list of strings, shown in the order provided) d axis labels for the histogram, the values in each series def axis values. Colors can be defined either as hex or RGB values with op opacity. Hex values are prefixed with #. RGB values are se with whitespace. <pre>#FF0000 - Red 0 0 255 - Blue</pre> • html: Supports the inclusion of raw HTML in a metric. You c simple html into tables allowing simple links to reports. For following command defines <code>test_html</code> as an html type of m <pre>define_metric -name test_html -type html</pre> You can the html metric, <code>test_html</code>, using the <code>set_metric c</code> <pre>set_metric -name test_html -value {<a href="url".</pre>
<code>-units <i>reporting_unit</i></code>	Specifies the unit for reporting. <i>Unit:</i> string
<code>-warning <i>threshold</i></code>	Specifies the warning threshold or name of metric containing t value.

Examples

The following command defines the `design.vtmix` metric :

```
update_metric_definition -name design.vtmix -tcl {return [TCL commands]}
```

Related Topics

- [get_metric_definition](#)

view_log

```
view_log
[-help]
[file_name logFileName]
```

Opens up a log file in a separate console window for viewing within the Tempus.

The log file viewer within the Tempus opens the current log file by default, and updates it in real time. If you specify a log file name, the software opens up the specified log file.

The log file displayed contains `[+]` and `[-]` markers that expand and collapse command information, so that you can control how much detail you want to read. Log messages are color coded for easier identification: blue messages are warnings, red messages are errors.

You can access documentation for commands in the log file that are underlined. Click on the command in the file, and the software opens an HTML window displaying the *Tempus Text Command Reference* documentation for that command.

You also can access the log file viewer from the *Tools Menu - Log Viewer*.

Note: You can specify `view_log` more than once to view multiple log files in separate console windows simultaneously. However, you cannot open multiple versions of the current log file.

Parameters

<code>file_name</code> <code>logFileName</code>	Specifies the name of the log file to open.
<code>-help</code>	Outputs a brief description that includes type and default information for each <code>view_log</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man view_log</code> .

write_metric

```
write_metric  
[pattern]  
{-out_file fileName}  
[-format output_format]  
[-id metric_id]  
[-merge]  
[-names list_of_patterns]
```

Writes the current set of metrics to a file or stdout.

The `write_metric` command is used by `write_db` to write the metrics in the JSON format in the database directory. Super commands use `write_metric` to write metrics into the log file (stdout). This can also be used to write metrics in various formats by the user.

Parameters

<code>-out_file fileName</code>	Specifies the name of the file in which metrics is written.
<code>-format output_format</code>	Specifies the output format, json, xml, csv, tcl. <i>Default:</i> JSON
<code>-help</code>	Outputs a brief description that includes type and default information for each <code>write_metric</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man write_metric</code>
<code>-id metric_id</code>	Specifies a list of labels from <code>read_metrics</code> . <i>Default:</i> Current metric
<code>-merge</code>	Merges the results into an existing file.
<code>-names list_of_patterns</code>	Specifies the list of patterns to match snapshot names.
<code>pattern</code>	List of regular expressions to chose metrics to write. Default is all metrics (*)

Example

The following code shows the usage of the `write_metric` command:

```
# -----
```

```
# Generate a XML file for all timing, power, and flow metrics from
# from prects to postcts for a previous run (id v101)
# -----
read_metric -id v101 run101/dbs/postcts.enc.dat/design.metrics
write_metric -id v101 -format xml
```

write_metric_config

```
write_metric_config
[-help]
  fileName
[-format {html excel text}]
```

Writes the YAML structure for the requested format (text, html, or excel) to a file. As the configuration is written in YAML format, you can customize the page layout and table content you need in the report such as adding pages and tables, or adding new metrics to existing tables, removing metrics from existing tables, and rearranging the metric ordering.

Parameters

fileName	Specifies the name of the file in which metric config is written.
-format {html excel text}	Specifies the config for specified report_metric format.
-help	Outputs a brief description that includes type and default information for each <code>write_metric_config</code> parameter. For a detailed description of the command and all of its parameters, use the man command: man write_metric_config

Example

```
generates the report in the text format.
> write_metric_config -format text small.text ; # Edit the summary table
> read_metric_config -format text small.yaml
> report_metric -format text
```

Related Topics

- [read_metric_config](#)
- [report_metric](#)

read_metric_html_package

```
read_metric_html_package
[-help]
filename
```

Overwrites the HTML for `report_metric -format vivid` and the vivid page configuration (accessible via `read_metric_config/write_metric_config`) with the contents from the specified *filename*.

Parameters

<i>filename</i>	Specifies the name of the file from where the tool will read the metric package. If the specified <i>filename</i> is not a supported format, the tool will give an error message that the file format is invalid.
-help	Outputs a brief description that includes the type and default information for each <code>read_metric_html_package</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man read_metric_html_package</code>

Related Topics

- [read_metric_config](#)
- [write_metric_config](#)

get_metric_header

```
get_metric_header
-help
[-id db_id]
-name header_name
```

Returns the metric header information set by the `set_metric_header` command.

Parameters

-id db_id	Specifies the database ID.
- name header_name	Specifies the name of the header.
-help	Outputs a brief description that includes type and default information for each <code>get_metric_header</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: man get_metric_header

Example

The following command sets the value `bar` of the metric header `foo`:

```
> set_metric_header -name timing -value high
```

The following command returns the header value of the metric header `foo`

```
> get_metric_header -name timing
high
```

Related Topics

- [set_metric_header](#)

get_preference

get_preference
[-help]
preference_name

Returns the current preference settings.

Parameters

-help	Prints out the command usage
<i>preference_name</i>	Specifies the name of a preference.

Related Commands

- [set_preference](#)

delete_metric_header

```
delete_metric_header  
[-help]  
[-id database_id]  
-name header_name
```

Deletes the metric header.

Parameters

-help	Prints out the command usage. For a detailed description of the command, use the man command: <code>man delete_metric_header</code>
-id <i>database_id</i>	Specifies the database ID <i>Data_type</i> : string, optional
-name <i>header_name</i>	Specifies the header name to be deleted. <i>Data_type</i> : string, required

Example

- The following command deletes the metric header, `User`.

```
delete_metric_header -name User
```

clear_all_rulers

`clear_all_rulers -help`

Removes all ruler lines from the main window. You can also clear the ruler lines with the *Clear All Rulers* icon on the toolbar in the main window.

Parameters

- help	Prints a brief description that includes type and default information for each <code>clear_all_rulers</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man clear_all_rulers</code>
-----------	--

Related Information

- [create_ruler](#)

create_gui_shape

```
create_gui_shape  
[-help]  
[-layer layerName]  
[-name guiShapeName]  
[-width width]  
{-rect {x1 y1 x2 y2} | -line {x1 y1 x2 y2 ...} | -polygon {x1 y1 x2 y2 ...}}  
[ -line {x1 y1 x2 y2 ...} [-arrow ] ]
```

Adds a shape to the specified custom layer. You can use the `create_gui_shape` command at any point in the design flow. The shapes added by the command annotate comment shapes and do not show up in a DEF output.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>create_gui_shape</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man create_gui_shape</pre>
<code>-arrow</code>	Draws an arrow in the middle of the line segment to indicate the start to end direction. This parameter can only be used with <code>-line</code>. <i>Data_type</i>: bool, required
<code>-layer layerName</code>	Specifies the GUI layer name to use or create for the shape. If the specified layer does not exist, it is created automatically. If a layer is not specified, the tool automatically creates a layer with the name <code>defaultLayer</code> and adds the shape to it. <i>Data_type</i>: string, optional
<code>-line {x1 y1 x2 y2 ...}</code>	Creates a line, with <code>x1 y1 x2 y2 ...</code> specifying the coordinates for the line segments. The values are specified in microns. <i>Data_type</i>: (point)+, optional
<code>- name guiShapeName</code>	Specifies the name of the GUI shape. <i>Data_type</i>: string, optional
<code>-polygon {x1 y1 x2 y2 ...}</code>	Creates a polygon shape, with <code>x1 y1 x2 y2 ...</code> specifying the coordinates for the polygon segments. The values are specified in microns. <i>Data_type</i>: (point)+, optional
<code>-rect {x1 y1 x2 y2}</code>	Specifies the coordinates of the lower-left and upper-right points of the rectangle. The values are specified in microns. <i>Data_type</i>: rect, optional
<code>-width width</code>	Specifies the width of the shape border in pixels. The minimum (default) value is 1 and the maximum is 7. <i>Data_type</i>: int, optional

Examples

- The following command adds a triangular shape in layer 1:

```
create_gui_shape -layer 1 -polygon {95.841 -645 96.592 -644.147 96.926 -644.777}
```

- The following command adds a line shape with two segments:

```
create_gui_shape -layer 1 -line {95.841 -645 96.592 -644.147 96.926 -644.777}
```

- The following command adds a line shape with two segments and direction arrows:

```
create_gui_shape -layer 1 -line {95.841 -645 96.592 -644.147 96.926 -644.777} -arrow
```

- The following command adds a line shape of 3-pixel width:

```
create_gui_shape -layer 1 -line {95.841 -645 96.592 -644.147 96.926 -644.777} -width 3
```

create_ruler

```
create_ruler  
[-help] {{-center {x y} -radius value} | -coords {x1 y1 x2 y2 ...}}
```

Adds a ruler. For an orthogonal ruler, use `-coordinates` to specify ruler segments. For a circular ruler, use `-center` and `-radius`.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>create_ruler</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man create_ruler</pre>
<code>-center {x y}</code>	Specifies the coordinates for the center of a circular ruler. <i>Data_type</i>: point, optional
<code>-coords {x1 y1 x2 y2 ...}</code>	Specifies the beginning and ending coordinates for the ruler line segments. The values are in microns. <i>Data_type</i>: (point)+, optional
<code>-radius value</code>	Specifies the radius of a circular ruler. <i>Data_type</i>: double, optional

Example

- The following command creates a circular ruler of radius 500 with the center at {0 0}:

```
create_ruler -center {0 0} -radius 500
```

display_temperature_result

```
display_temperature_result  
[-help]  
-layer <string>  
-reset
```

Displays the tile-based temperature map file generated by Sigrity Celsius.

Parameters

-help	Prints a brief description that includes type and default information for each <code>display_temperature_result</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man display_temperature_result</pre>
-layer <string>	Displays the temperature map for the specified layer. Example: <pre>display_temperature_result -layer Metal6</pre>
-reset	Resets the temperature map display.

gui_add_marker

```
gui_add_marker  
[-help]  
-color <string>  
-name <string>  
-point {x y}  
-type {X TICK STAR}
```

Places a marker to indicate location on the design layout.

Parameters

<code>-help</code>	Outputs the command usage and a brief description about the command parameters.
<code>-color</code> <code><string></code>	Specifies the color of the marker. You can specify 16 colors for the marker. These are: red blue green yellow magenta cyan pink orange brown purple violet teal olive gold maroon wheat
<code>-name <string></code>	Specifies the name of the marker.
<code>-point {x y}</code>	Specifies the location {x y} at which the marker will be placed on the design layout.
<code>-type {X TICK</code> <code>STAR}</code>	Specifies the shape of the marker. There are three shapes for the markers: X, TICK, and STAR.

Example

- The following command shows that a X type marker of color RED has been placed at the location {100 100}.

```
gui_add_marker -name aa -color red -point {100 100} -type X
```

gui_add_ui

```
gui_add_ui
[-help]
name
[-before name]
[-checked {true | false}]
[-command string]
[-disabled {true | false}]
[-enable_variable string]
[-foreground string]
[-icon filename]
[-in name]
[-label string]
[-menu_separate {true | false}]
[-movable {true | false}]
[-newline {true | false}]
[-shortcut string]
[-tooltip string]
-type {menu | toolbar | submenu | command | check | radio | separator | toolbutton}
[-underline integer]
[-value string ]
[-variable string]
[-visible_variable string]
```

Adds a new interface element with the specified name of the specified type. Use this command to customize the graphical interface by adding menus, toolbars, status bar, and other interface elements, as required.

Parameters

-help	Prints a brief description that includes type and default information for each <code>gui_add_ui</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man gui_add_ui</pre>
name	Specifies as a string the internal name of the interface element you want to add. Note: Choose the internal name of the element carefully as this is what is used internally by the software to identify the element for any further manipulation.

<code>-before <i>name</i></code>	When specified, adds the new element before the element identified by <i>name</i> .
<code>-checked {true false}</code>	Specifies whether or not the check box or radio button you are adding should be checked. Note: You can use the <code>-checked</code> parameter only if you are adding elements of type <code>check</code> or <code>radio</code>. <i>Default:</i> <code>false</code>
<code>-command <i>string</i></code>	Specifies the Tcl command to be executed when the element you are adding is invoked. Note: You can use the <code>-command</code> parameter only if you are adding elements of type <code>command</code>, <code>check</code>, <code>radio</code> or <code>toolbutton</code>.
<code>-disabled {true false}</code>	Specifies the state of the interface element you are adding. Note: You can use the <code>-disabled</code> parameter only if you are adding elements of type <code>menu</code>, <code>submenu</code>, <code>command</code>, <code>check</code>, <code>radio</code> or <code>toolbutton</code>. The parameter is NOT applicable for elements of type <code>toolbar</code> and <code>separator</code>. <i>Default:</i> <code>false</code>
<code>-enable_variable <i>string</i></code>	Represents the Tcl global variable for Enable status.
<code>-foreground <i>string</i></code>	Specifies foreground color of the icon. Note: You can use the <code>-foreground</code> parameter only if you are adding an element of type <code>toolbutton</code>.
<code>-icon <i>filename</i></code>	When adding a <code>toolbutton</code>, specifies the file name of the <code>toolbutton</code> icon. <i>filename</i> can be the full path of the icon file or an icon name supported by the tool. The icon names used in the tool can be queried using the <code>gui_get_ui</code> command. Note: The <code>-icon</code> parameter is applicable only for elements of type <code>toolbutton</code>.
<code>-in <i>name</i></code>	Specifies the name of the parent element. Use this parameter along with <code>-before</code> to specify the location of the element you are adding. By default, <code>-in</code> adds the element to the end of the parent element. Use <code>-before</code> to add the element at a specific location within the parent element. Note: If <code>-in</code> is not specified, the new element is created but is not added to any location.

<code>-label <i>string</i></code>	Specifies the label to be displayed on the new element. Note: This parameter is NOT applicable for elements of type <code>separator</code>.
<code>-menu_separate {true false}</code>	Specifies whether or not a menu or submenu being added can be torn off or detached. Note: This parameter is applicable for elements of type <code>menu</code> and <code>submenu</code>. <i>Default:</i> <code>true</code> <i>Data_type:</i> <code>bool</code>, optional
<code>-movable {true false}</code>	When adding a toolbar, specifies whether or not it will be movable. <i>Data_type:</i> <code>bool</code>, optional
<code>-newline {true false}</code>	When adding a toolbar, specifies whether or not the toolbar should be added as a new row. Note: The <code>-newline</code> parameter is applicable only for elements of type <code>toolbar</code>. <i>Default:</i> <code>false</code>
<code>-shortcut <i>string</i></code>	Specifies the shortcut key for a command, check box, radio button, or toolbar. Note: You can use the <code>-shortcut</code> parameter only if you are adding elements of type <code>command</code>, <code>check</code>, <code>radio</code>, or <code>toolbar</code>.
<code>-tooltip <i>string</i></code>	Specifies the tooltip text for the toolbar or toolbar you are adding. Note: The <code>-tooltip</code> parameter is applicable only for elements of type <code>toolbar</code> and <code>toolbar</code>.
<code>-type {menu toolbar submenu command check radio separator toolbar}</code>	
	Specifies the type of the interface element you want to add. Currently, elements of type <code>main</code> and <code>statusbar</code> are not supported.

<code>-underline <i>integer</i></code>	Specifies the integer index of the character to be underlined in the element label. The index begins with 0 and should have a value less than or equal to the length of the element label. For instance, if you want the second letter of the element label to appear underlined, specify <i>integer</i> as 1. Note: The <code>-underline</code> parameter is NOT applicable for elements of type <code>toolbar</code>, <code>separator</code>, and <code>toolbutton</code>. Note: This parameter can be used only if the <code>-label</code> parameter is also specified.
<code>-value <i>stringValue</i></code>	When adding a radio button, specifies the value to be stored in the associated variable when the radio button is selected. Note: The <code>-value</code> parameter is applicable only for elements of type <code>radio</code>.
<code>-variable <i>string</i></code>	When adding a check box or radio button, specifies the Tcl global variable for the item.
<code>-visible_variable <i>string</i></code>	Represents the Tcl global variable for Visible status

Examples

- The following command will add a new, non-detachable menu labeled *ExampleMenu* in the main window:

```
gui_add_ui exmpMenu -type menu -label ExampleMenu -menu_separate false -in main
```

- The following command will add a new menu item labeled *ExampleCommand* in *ExampleMenu*:

```
gui_add_ui exmpCommand -type command -label ExampleCommand -in exmpMenu -command [list puts Example Command]
```

- The following command adds a new, unmovable toolbar to the layout window:

```
gui_add_ui newTB -type toolbar -in main.layout -movable false
```

gui_attach_to_cursor

```
gui_attach_to_cursor  
[-help]  
[ -selected | objects ]
```

Attaches selected or specified objects to the cursor. The use model is as follows:

1. Select the object(s) to be moved by using the `gui_attach_to_cursor` command.
2. Zoom into the location where you want to place the object(s).
3. Click at the required location to place the selected object(s) there.

This command is useful during floorplanning when you may need to move multiple objects into the same zoomed in area.

Parameters

<code>-help</code>	Prints a brief description of the <code>gui_attach_to_cursor</code> command. For a detailed description of the command, use the <code>man</code> command: <code>man gui_attach_to_cursor</code> .
<code><i>objects</i></code>	Specifies the object pointer list.
<code>-selected</code>	Attaches the selected objects to the cursor.

Example

The following command attaches objects `A` and `B` to the cursor:

```
gui_attach_to_cursor {A B}
```

Now, move the cursor to the layout and click at the desired location to place objects `A` and `B` there.

gui_clear_highlight

```
gui_clear_highlight
[-help]
[obj_list]
[-all | -index indexValue | -original | -select]
```

Removes highlights from all the highlighted objects at any stage of the design flow. You can choose to clear highlight from all objects, selected objects, objects highlighted with original color, or objects with specified index values.

Parameters

-help	Prints a brief description that includes type and default information for each <code>gui_clear_highlight</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man gui_clear_highlight</code>
-all	Specifies that highlight will be cleared from all objects.
-index indexValue	Specifies that highlight will be cleared from the objects with the specified index value. The index value is the value of the Highlight Set as specified through the <i>View - Highlight Selected</i> menu or through the gui_highlight command. The <i>View - Highlight Selected</i> menu provides eight highlight patterns to choose from. The value of index should, therefore, be a number be from 1 to 8. As an example, if you specify a value of 3 for index, all highlight will be cleared from from all objects that are highlighted as Highlighted Set 3.
obj_list	Specifies the object pointer list for clearing highlight.
-original	Specifies that highlight should be cleared from the objects highlighted with original color.
-select	Specifies that highlight should be cleared from all selected objects.

Examples

- The following command clears highlight from all highlighted objects.
`gui_clear_highlight`
- The following command clears highlight from all objects that have been highlighted as Highlight

Set 4 through the *View - Highlight Selected* menu or through the `gui_highlight` command.

`gui_clear_highlight -index 4`

- The following command clears highlight from all highlighted objects that are currently selected in the display window.

`gui_clear_highlight-select`

gui_create_user_bundle_net

```
gui_create_user_bundle_net  
[-help]  
name  
-nets net_list  
-start object_name  
-end object_name
```

Creates a bundle of specified nets that can be displayed as flightlines. Bundled nets help you with data flow analysis before and after layout. Net bundles can be created and viewed in floorplan and amoeba views. Each custom net bundle displays the number of nets in it and works for macros, blobs, and giudes.

Using `gui_create_user_bundle_net`, you can create custom bundled nets that allow you to define your own net bundles as per your requirements. This is useful while debugging physical properties of interconnects within a complicated hierarchical design because you can define start and end points of a net bundle. As a result, you can create and display only relevant flightlines, instead of looking at all the flightlines of specified nets.

Note: One net can be part of multiple net bundles simultaneously.

You can display flightline net bundles using the [gui_show_user_bundle_nets](#) command and delete them using the [gui_delete_user_bundle_net](#) command.

Note: You can choose to display flightlines for only bundled nets by using the *Only Show Net Bundle Flight Line* option in the Preferences form. If this option is not selected, the net bundle flightlines are displayed along with other selection-based flightlines by default.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>gui_create_user_bundle_net</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man gui_create_user_bundle_net</pre>
<code>name</code>	Specifies the name of the custom net bundle.
<code>-nets net_list</code>	Specifies the list of nets to be included in the net bundle. You can use patterns with wildcards to specify net names. All the nets that match the specified pattern are put in the same bundle.
<code>-start object_name</code>	Specifies the name of object which is the start point of the nets. The object type includes inst, hinst, port, base_pin, and group.
<code>-end object_name</code>	Specifies the name of object which is the end point of the nets. The object type includes inst, hinst, port, base_pin, and group.

Examples

- The following command creates a bundle called `bundle_1`, which contains flightlines of nets `net_1` and `net_2`:

```
gui_create_user_bundle_net bundle_1 -nets {net_1 net_2} -start Module1 -end Module2
```

You can then use the `gui_show_user_bundle_nets` command to display `bundle_1` flightlines as follows:

```
gui_show_user_bundle_nets -net_bundle bundle_1
```

Related Information

- [gui_delete_user_bundle_net](#)
- [gui_show_user_bundle_nets](#)

gui_delete_objs

```
gui_delete_objs  
[-help]  
[-shape | -text | -marker | -all | -selected | -list string]
```

Deletes specified or selected GUI objects.

Parameters

-help	Prints out the command usage. For a detailed description of the command, use the <code>man</code> command: <code>man gui_delete_objs</code>
-all	Deletes all GUI objects. <i>Data_type</i> : bool, optional
- list <i>string</i>	Deletes the specified list of GUI objects. Here, <i>string</i> represents a list of object pointers. You can also specify input in the Tcl Dual Ported Object (DPO) format. <i>Data_type</i> : string, optional
-marker	Deletes GUI markers. <i>Data_type</i> : bool, optional
-selected	Deletes selected GUI objects. <i>Data_type</i> : bool, optional
-shape	Deletes GUI shapes. <i>Data_type</i> : bool, optional
-text	Deletes GUI texts. <i>Data_type</i> : bool, optional

Related Information

- [gui_add_marker](#)
- [create_gui_shape](#)

gui_delete_ui

`gui_delete_ui [-help] name`

Deletes an existing interface element with the specified name. If multiple interface elements are found with the same name, the first matched element is deleted. Use this command to customize the graphical interface by removing menus, menu items, and other interface elements that you do not require any longer.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>gui_delete_ui</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man gui_delete_ui</pre>
<code>name</code>	Specifies the internal name of the interface element as a string. An error is returned if an interface element with the specified name does not exist. Note: Here, <code>name</code> represents the internal name assigned to the element when it was added to the interface and not the label that is displayed on the interface. If you specify the label instead of the name, the software will return an error.

Examples

- The following command will delete an interface element with the internal name `Menu1`:

```
gui_delete_ui Menu1
```

Related Information

- `gui_add_ui`
- `gui_find_ui`
- `gui_get_ui`
- `gui_set_ui`

gui_delete_user_bundle_net

```
gui_delete_user_bundle_net  
[-help]  
name
```

Deletes the specified flightline net bundle. If a net is part of multiple net bundles and you delete one of the net bundles, other net bundles containing the net are not affected.

You can create flightline net bundles using the `gui_create_user_bundle_net` command and display them using the `gui_show_user_bundle_nets` command.

Note: `gui_delete_user_bundle_net` removes the specified net bundle. If you want to retain the net bundle but just want to clear its flightlines from the display area, use the `-remove` option of `gui_show_user_bundle_nets` instead.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>gui_delete_user_bundle_net</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man gui_delete_user_bundle_net</pre>
<code>name</code>	Specifies the name of the flightline net bundle to be removed.

Examples

- The following command deletes the flightline net bundle `bundle_1`:

```
gui_delete_user_bundle_net bundle_1
```

Related Information

- `gui_create_user_bundle_net`
- `gui_show_user_bundle_nets`

gui_deselect

```
gui_deselect  
[-help]  
{-all |  
-rect {x1 y1 x2 y2} |  
-point {x y} |  
-line {x1 y1 x2 y2}}
```

Deselects objects as per the parameters you specify. If `-all` is specified, deselects all selected objects.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>gui_deselect</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man gui_deselect</code>
<code>-all</code>	Deselects all objects.
<code>-line {x1 y1 x2 y2}</code>	Deselects objects through which the specified line passes.
<code>-point {x y}</code>	Deselects objects at the specified point.
<code>-rect {x1 y1 x2 y2}</code>	Deselects objects within the specified box coordinates.

Related Information

- [deselect_obj](#)
- [gui_select](#)
- [select_obj](#)

gui_dim_foreground

```
gui_dim_foreground
[-help]
-light_level {default medium dark}
```

Dims the display area to the specified level. Use this command to view selected and highlighted objects clearly against the dimmed foreground. This command is especially useful when you are debugging.

The equivalent bindkey is F12.

Parameters

- help	Prints a brief description that includes type and default information for each <code>gui_dim_foreground</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man gui_dim_foreground</code> .
-light_level {default medium dark}	
	Specifies the brightness level of the foreground in the display area.

Related Information

- `gui_highlight`
- `gui_select`

gui_find_ui

```
gui_find_ui
[-help]
[name]
[-before name]
[-checked true | false]
[-command string]
[-disabled true | false]
[-enable_variable string]
[-foreground string]
[-icon filename]
[-in parent_name]
[-label string]
[-menu_separate true | false]
[-movable true | false]
[-newline true | false]
[-shortcut string]
[-tooltip string]
[-type {menu toolbar submenu command check radio separator toolbutton}]
[-underline index]
[-value string]
[-variable string]
[-visible_variable string]
```

Enables you to retrieve an element's name by specifying a property-value combination.

Parameters

-help	Prints a brief description that includes type and default information for each <code>gui_find_ui</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man gui_find_ui</pre>
<i>name</i>	Specifies the name of the parent element to define the search scope. If multiple elements are found with the same <i>name</i>, the first matched element is searched. If <i>name</i> is not specified, a global search is performed. <i>Data_type</i>: string, optional

<code>-before <i>name</i></code>	Returns the element that is positioned just before the element identified by <i>name</i>. <i>Data_type</i>: string, optional
<code>-checked {true false}</code>	Returns the names of check boxes and radio buttons with the specified checked state. <i>Data_type</i>: bool, optional
<code>-command <i>string</i></code>	Returns the name of the interface element that executes the specified command string. Note: You can use the <code>-command</code> parameter only for elements of type <code>command</code>, <code>check</code>, <code>radio</code> or <code>toolbutton</code>. <i>Data_type</i>: string, optional
<code>-disabled {true false}</code>	Returns the name of the interface elements with the specified state. Note: You can use the <code>-disabled</code> parameter only for elements of type <code>menu</code>, <code>submenu</code>, <code>command</code>, <code>check</code>, <code>radio</code> or <code>toolbutton</code>. <i>Data_type</i>: bool, optional
<code>-enable_variable <i>string</i></code>	Returns the name of the interface elements with the specified Enable status. <i>Data_type</i>: string, optional
<code>-foreground <i>string</i></code>	Returns the name of the tool button with the specified foreground color of the icon. Note: You can use the <code>-foreground</code> parameter only for elements of type <code>toolbutton</code>. <i>Data_type</i>: string, optional
<code>-icon <i>filename</i></code>	Returns the name of the tool button with the specified image file in its icon. <i>filename</i> can be the full path of the icon file or an icon name supported by the tool. The icon names used in the tool can be queried using the <code>gui_get_ui</code> command. Note: The <code>-icon</code> parameter is applicable only for elements of type <code>toolbutton</code>. <i>Data_type</i>: string, optional

<code>-in parent_name</code>	Returns the name of the interface elements with the specified parent name. <i>Data_type</i>: string, optional
<code>-label string</code>	Returns the name of the interface element with the specified label. Note: This parameter is NOT applicable for elements of type <code>separator</code>. <i>Data_type</i>: string, optional
<code>-menu_separate true false</code>	
	Returns the menus or submenus with the specified tear-off status. Note: This parameter is applicable for elements of type <code>menu</code> and <code>submenu</code>. <i>Data_type</i>: bool, optional
<code>-movable true false</code>	Returns whether the object is movable or not. <i>Data_type</i>: bool, optional
<code>-newline {true false}</code>	Returns the name of the toolbars with the specified newline status. Note: The <code>-newline</code> parameter is applicable only for elements of type <code>toolbar</code>. <i>Data_type</i>: bool, optional
<code>-shortcut string</code>	Returns the name of the interface elements with the specified shortcut key. Note: You can use the <code>-shortcut</code> parameter only for elements of type <code>command</code>, <code>check</code>, <code>radio</code>, or <code>toolbutton</code>. <i>Data_type</i>: string, optional
<code>-tooltip string</code>	Returns the name of the toolbar or toolbutton with the specified tooltip text. Note: The <code>-tooltip</code> parameter is applicable only for elements of type <code>toolbar</code> and <code>toolbutton</code>. <i>Data_type</i>: string, optional
<code>-type {menu toolbar submenu command check radio separator toolbutton}</code>	

	Returns the name of the interface elements of the specified type. <i>Data_type</i> : enum, optional
<code>-underline index</code>	Returns the name of the interface elements that has character with the specified integer index underlined in the element label. The index begins with 0, so for example, to find elements that have the third character in their label underlined, specify an index value of 2. <i>Data_type</i> : int, optional
<code>-value stringValue</code>	Returns the name of the radio button with the specified value. Note: The <code>-value</code> parameter is applicable only for elements of type <code>radio</code> . <i>Data_type</i> : string, optional
<code>-variable string</code>	Returns the name of the check boxes or radio buttons with the specified the Tcl global variable. <i>Data_type</i> : string, optional
<code>-visible_variable string</code>	Returns the name of the interface elements with the specified Visible status. <i>Data_type</i> : string, optional

Examples

- The following command returns the names of all the menus in the main window:
`gui_find_ui main -type menu`
- The following command returns the names of detachable submenus (that is, with `menu_separate` setting as `true`) in the *View* menu that are detachable main window:
`gui_find_ui view -menu_separate true`
- The following command returns the name of the element before the Help menu in the main window:
`gui_find_ui -before help`
- The following command returns the name of the element with shortcut key F:
`gui_find_ui -shortcut F`
The software returns the following:
`tbView.ac.view.fit`

gui_fit

gui_fit [-help]

Fits the entire design in the viewable window. You can use this command at any stage of the design flow to view the design in entirety.

Parameters

-help	Prints a brief description of the <code>gui_fit</code> command. For a detailed description of the command, use the <code>man</code> command: <code>man gui_fit</code> .
-------	--

Related Information

- [gui_zoom](#)

gui_get_edge_number

```
gui_get_edge_number
[-help]
[-coordinate]
[-edge index_num]
-objects name|inst_ptr hinst_ptr
```

Returns the total number of edges and/or edge coordinates for the specified block.

You can use the related `gui_show_edge_number` command to display edge numbers on the sides of the selected or specified objects in the GUI.

Parameters

-help	Prints a brief description of the <code>gui_get_edge_number</code> command. For a detailed description of the command, use the <code>man</code> command: <code>man gui_get_edge_number.</code>
- coordinate	Returns the coordinates of all the edges. <i>Data_type</i> : bool, optional
-edge <i>index_num</i>	Returns the coordinates of the specified edge for the specified object. The <i>index_num</i> value should be greater than or equal to 0. <i>Data_type</i> : int, optional
-objects <i>name inst_ptr hinst_ptr</i>	
	Specifies the object(s) for which edge numbers and/or coordinates are to be returned. You can specify the object(s) either by name or as inst/hinst pointers. <i>Data_type</i> : (inst hinst)+, required

Examples

- The following command returns the total number of edges of the specified instance:

```
gui_get_edge_number -objects  
ram1/subram02_lower/TESTACT_INST_PERIWDSRAM001PAA512W27C3/U202
```

Returns:

```
4
```

- The following command returns the coordinates of all the edges of the specified instance:

```
gui_get_edge_number -objects  
ram1/subram02_lower/TESTACT_INST_PERIWDSRAM001PAA512W27C3/U202 -coordinate
```

Returns:

```
{edge0:{ 97.152000 -645.084000 97.152000 -643.896000 } edge1:{ 97.152000 -643.896000  
98.736000 -643.896000 } edge2:{ 98.736000 -643.896000 98.736000 -645.084000 } edge3:{  
98.736000 -645.084000 97.152000 -645.084000 } }
```

- The following command returns the coordinates of edge with index number 0 for the specified instance:

```
gui_get_edge_number -objects  
ram1/subram02_lower/TESTACT_INST_PERIWDSRAM001PAA512W27C3/U202 -edge 0
```

Returns:

```
{97.152000 -645.084000 97.152000 -643.896000}
```

Related Information

- [gui_show_edge_number](#)

gui_get_objects_from_schematic

```
gui_get_objects_from_schematic
[-name string]
-type {all insts modules nets ports}
```

Gets all or the specified type of objects from the current (active) or specified schematic view.

Parameters

-help	Prints a brief description of the <code>gui_get_objects_from_schematic</code> command. For a detailed description of the command, use the <code>man</code> command: <code>man gui_get_objects_from_schematic</code>.
-name <i>string</i>	Specifies the name of the schematic view from which objects need to be returned. You can use the <code>gui_get_schematic</code> command to get the name of the schematic. If <code>-name</code> is not specified, returns objects from the current schematic view. <i>Data_type</i>: string, optional
-type {all insts modules nets ports}	
	Specifies the type of the objects to be returned. If <code>all</code> is specified, returns the name of all objects from the current or specified schematic view. <i>Data_type</i>: enum, required

Examples

- The following command returns the instances from the current schematic:

```
> gui_get_objects_from_schematic -type insts
```

Sample output:

```
ram1/subram02_lower/TESTACT_INST_PERIWDSRAM001PAA512W27C3/FE_OFC1329_q02_8_  
ram1/subram02_lower/TESTACT_INST_PERIWDSRAM001PAA512W27C3/FE_OFC1326_q02_10_  
ram1/subram02_lower/TESTACT_INST_PERIWDSRAM001PAA512W27C3/TESTACT_WSRAM/assignbuf_709853  
ram1/subram02_lower/TESTACT_INST_PERIWDSRAM001PAA512W27C3/U170  
ram1/subram02_lower/TESTACT_INST_PERIWDSRAM001PAA512W27C3/U182  
ram1/subram02_lower/TESTACT_INST_PERIWDSRAM001PAA512W27C3/U184  
ram1/subram02_lower/TESTACT_INST_PERIWDSRAM001PAA512W27C3/U187  
ram1/subram02_lower/TESTACT_INST_PERIWDSRAM001PAA512W27C3/U189  
ram1/subram02_lower/TESTACT_INST_PERIWDSRAM001PAA512W27C3/U202
```

- The following command returns the nets from the schematic view named w0:

```
> gui_get_objects_from_schematic -name W0 -type nets
```

Sample output:

```
ram1/subram02_lower/TESTACT_INST_PERIWDSRAM001PAA512W27C3/n7  
ram1/subram02_lower/TESTACT_INST_PERIWDSRAM001PAA512W27C3/tpo_a_9_ VSS VDD
```

[-current | -all ]
```

Gets the name of the current (active) schematic view. If `-all` is specified, returns the name of all open schematic views.

Parameters

-help	Prints a brief description of the <code>gui_get_schematic</code> command. For a detailed description of the command, use the <code>man</code> command: <code>man gui_get_schematic</code> .
-all	Gets the names of all open schematic views. <i>Data_type:</i> bool, optional
-current	Gets the name of the current active schematic view. <i>Data_type:</i> bool, optional

  | -variable  
  | -visible  
  | -visible_variable  
  | -window_status ]
```

Retrieves the current value of the specified property of the element that is being queried. Using the `gui_get_ui` command, you can query all the properties in the `gui_add_ui` command for each type. In addition, depending on the `type`, some special properties are supported too as described below:

- For elements of type `menu/submenu/toolbar`:
 - `gui_get_ui name -children`
Returns a list of all the child elements of the specified interface element.
- For `main` (main window):

- `gui_get_ui main -menu`
Returns a list of all the menus in the main window.
- `gui_get_ui main -toolbar`
Returns the list of all the toolbars in the main window.
- `gui_get_ui main -statusbar`
Returns the status bar in the main window.
- `gui_get_ui main -geometry`
Returns the geometry of the main window in the format `widthXheight+x+y`.
- `gui_get_ui main -title`
Returns the title of the main window.
- `gui_get_ui main -titlebar_color`
Returns the color of the title bar of the main window.
- `gui_get_ui main -closecmd`
Returns the close confirmation command of the main window.
- `gui_get_ui main -visible`
Returns the visibility status of the main window.
- For `statusbar`:
 - `gui_get_ui name -message`
Returns the current message of the status bar.
 - `gui_get_ui name -visible`
Returns the visibility status of the status bar.
 - `gui_get_ui name -in`
Returns the parent element of the status bar.

`statusbar` also supports the `-enable_variable` and `-visible_variable` parameters.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>gui_get_ui</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man gui_get_ui</pre>
--------------------	--

<i>name</i>	Specifies as a string the name of the interface element you want to query. If multiple widgets are found with the same <i>name</i>, the first matched widget is queried. Returns an error if there is no element with the specified name. <i>Data_type</i>: string, optional
-before	When specified, returns the element that occurs before the element identified by <i>name</i>. <i>Data_type</i>: string, optional
-checked	Returns the on/off state of the specified check box or radio button. If the check box or radio button is selected, returns <code>true</code>. If it is deselected, returns <code>false</code>. <i>Data_type</i>: bool, optional
-children	Returns child elements of specified interface element. Note: You can use this parameter with elements of type <code>menu</code>, <code>submenu</code>, and <code>toolbar</code>. <i>Data_type</i>: string, optional
-command	Returns the Tcl command to be executed when the specified element you are adding is invoked. Note: You can use the <code>-command</code> parameter only with elements of type <code>command</code>, <code>check</code>, <code>radio</code> or <code>toolbutton</code>. <i>Data_type</i>: string, optional
-disabled	When specified, returns whether the specified interface element is enabled (<code>false</code>) or disabled (<code>true</code>). Note: You can use the <code>-disabled</code> parameter only with elements of type <code>menu</code>, <code>submenu</code>, <code>command</code>, <code>check</code>, <code>radio</code> or <code>toolbutton</code>. The parameter is NOT applicable for elements of type <code>toolbar</code> and <code>separator</code>. <i>Data_type</i>: bool, optional
-dock_widget	Returns the dock widget in the window. <i>Data_type</i>: string, optional
-enable_variable	Represents the Tcl global variable for Enable status. <i>Data_type</i>: string, optional

-foreground	Returns the foreground color of the icon for the specified toolbutton. Note: You can use the <code>-foreground</code> parameter only with elements of type <code>toolbutton</code> . <i>Data_type:</i> string, optional
-geometry	Returns the width, height, and coordinates of the main window. Note: The <code>-geometry</code> parameter is applicable only for the main window, which is type <code>main</code> . <i>Data_type:</i> string, optional
-icon	Returns the file name of the specified toolbutton. Note: The <code>-icon</code> parameter is applicable only for elements of type <code>toolbutton</code> . <i>Data_type:</i> string, optional
-in	Returns the name of the parent element. <i>Data_type:</i> string, optional
-label	Returns the label of the specified element. Note: This parameter is NOT applicable for elements of type <code>separator</code> . <i>Data_type:</i> string, optional
-menu	Returns the names of the menus in the main window. Note: This parameter is applicable only for the main window, which is type <code>main</code> . <i>Data_type:</i> string, optional
-menu_separate	Returns the tear-off status of the specified menu or submenu. Note: This parameter is applicable for elements of type <code>menu</code> and <code>submenu</code> . <i>Data_type:</i> bool, optional
-message	Returns the message on the status bar. Note: This parameter is applicable only for the status bar. <i>Data_type:</i> string, optional
-movable	Returns whether object is movable or not. <i>Data_type:</i> bool, optional

<code>-newline</code>	Returns whether or not the specified toolbar starts in a new row. Note: The <code>-newline</code> parameter is applicable only for elements of type <code>toolbar</code>. <i>Data_type:</i> bool, optional
<code>-quiet</code>	Displays the current settings for the specified parameters in the Tcl list format. <i>Data_type:</i> bool, optional
<code>-shortcut</code>	Returns the shortcut key for a command, check box, radio button, or toolbutton. Note: You can use the <code>-shortuct</code> parameter only with elements of type <code>command</code>, <code>check</code>, <code>radio</code>, or <code>toolbutton</code>. <i>Data_type:</i> string, optional
<code>-statusbar</code>	Returns the name of the main window's status bar. Note: This parameter is applicable only for the main window (<code>main</code>). <i>Data_type:</i> string, optional
<code>-title</code>	Returns the text on the main window's title bar. Note: This parameter is applicable only for the main window (<code>main</code>). <i>Data_type:</i> string, optional
<code>-titlebar_color</code>	Gets the color of the title bar of the window. Note: This parameter is applicable only for the main window (<code>main</code>). <i>Data_type:</i> string, optional
<code>-toolbar</code>	Returns the toolbars in the window. <i>Data_type:</i> string, optional
<code>-tooltip</code>	Returns the tooltip text for the specified toolbar or toolbutton. Note: The <code>-tooltip</code> parameter is applicable only for elements of type <code>toolbar</code> and <code>toolbutton</code>. <i>Data_type:</i> string, optional
<code>-type</code>	Returns the type of the specified element. <i>Data_type:</i> enum, optional

-underline	Returns the integer index of the underlined character in the element label. Note: The <code>-underline</code> parameter is NOT applicable for elements of type <code>toolbar</code>, <code>separator</code>, and <code>toolbutton</code>. <i>Data_type:</i> int, optional
-value	Returns the value stored in the associated variable of the specified radio button. Note: The <code>-value</code> parameter is applicable only for elements of type <code>radio</code>. <i>Data_type:</i> string, optional
-variable	Returns the Tcl global variable for the specified check box or radio button. <i>Data_type:</i> string, optional
-visible	Returns the visibility status of the element. <i>Data_type:</i> string, optional
-visible_variable	Represents the Tcl global variable for Visible status. <i>Data_type:</i> string, optional
-window_status	Returns the widget window status. This option returns one of the following values, depending on the window status, assuming that tool was launched in the GUI mode: • Minimized • Maximized • Normal For example, if the main window is in the default window mode, and you run the following command: <pre>gui_get_ui main -window_status</pre> the software returns: <pre>Normal</pre> ✓ If the window is in the background, you can use the following command to bring the window to the forefront: <pre>gui_set_ui main -visible 1</pre> <i>Data_type:</i> string, optional

Examples

- The following command returns the names of all the menus in the main window:

```
gui_get_ui main -menu
```

- The following command returns the window status of the main window:

```
gui_get_ui main -window_status
```

The software returns the following (assuming the window is in the maximized mode at the time):

```
Maximized
```

- The following command returns the tear-off status of the *View* menu:

```
gui_get_ui view -menu_separate
```

The software returns the following:

```
true
```

gui_get_visible_bumps

gui_get_visible_bumps
[-help]

Returns the names of all visible bump cells in the design if some bumps have been hidden in the design.

Parameters

- help	Prints a brief description that includes type and default information for each <code>gui_get_visible_bumps</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man gui_get_visible_bumps</code>
-----------	--

Examples

- The following command returns the name of all visible bumps in the designs:

```
gui_get_visible_bumps
```

Related Information

- [gui_set_visible_bumps](#)

gui_get_visible_net_groups

gui_get_visible_net_groups
[-help]

Returns the names of the visible net groups if some net groups have been hidden in the design. If all net groups are visible, this command has no effect.

Parameters

- help	Prints a brief description that includes type and default information for each <code>gui_get_visible_net_groups</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man gui_get_visible_net_groups</code>
-----------	--

Examples

- The following command returns the name of all visible net groups in the designs:

```
gui_get_visible_net_groups  
test_ng
```

Related Information

- [gui_set_visible_net_groups](#)

gui_get_visible_nets

gui_get_visible_nets
[-help]

Returns the names of the visible nets if some nets have been hidden in the design. If all nets are visible, this command has no effect.

Parameters

- help	Prints a brief description that includes type and default information for each <code>gui_get_visible_nets</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man gui_get_visible_nets</code>
-----------	--

Examples

- The following command hides all nets except the specified net:

```
> gui_get_visible_nets  
ram1/subram02_lower/TESTACT_INST_PERIWDSRAM001PAA512W27C3/tpo_a_9_
```

gui_highlight

```
gui_highlight
[-help]
[<any_object>+]
[-index indexValue | -auto_color | -original]
[-color colorValue | -auto_color | -original]
[-pattern patternValue | -original]
```

Highlights selected or specified objects with the Highlight Set available through the *View - Highlight Selected* menu. The value for the index corresponds to the Highlight Set that will be applied. For example, a value of 4 for the index specifies that all selected objects will be highlighted with the same color and pattern as available for the *Highlight Set #4* in the *View - Highlight Selected* menu. You can use this command at any stage in the design flow.

You can also provide a specific color and/or pattern to be used. All selected objects will be highlighted with the color and/or pattern that you specify.

If you specify a color and or pattern, the Highlight Set corresponding to the index value will be updated to use the color and pattern specified. For example, if you specify an index value of 5, color `green`, and pattern `backslash`, the *Highlight Set #5* will get updated to have the color `green` and the pattern `backslash`.

You can remove highlight from the highlighted objects through the `gui_clear_highlight` command or through the *View - Clear Highlight* menu.

Note: If an object is selectable, you can highlight it using the `gui_highlight` command.

Use the `gui_highlight_pin` command to highlight shapes for specified SIGNAL/POWER pins.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>gui_highlight</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man gui_highlight</pre>
<code>any_object+</code>	Specifies the object pointer list for highlighting.
<code>-auto_color</code>	Specifies the object color automatically. Note: This parameter cannot be used with <code>-index</code> or <code>-color</code>.

-index <i>indexValue</i>	Specifies the index value for the specified object. All objects that are selected will be highlighted with the same color and pattern as defined in corresponding Highlight Set in the <i>View - Highlight Selected</i> menu As an example, if you specify a value of 3 for index, all objects that are selected will be highlighted with the same color and pattern as available for the <i>Highlight Set #3</i> in the <i>View - Highlight Selected</i> menu. The value of index should be between 1 to 64.
-color <i>colorValue</i>	Specifies the color value for the specified object. The color value is the same as that available through the Edit Highlight Color form (<i>View - Edit Highlight Color</i>). You can also use the Red Green Blue (RGB) value in the following format: <i>#V1V2V3</i> where V1, V2, and V3 are the hexadecimal values for the red, green, and blue color components respectively. For example, you can specify the value <i>#CC66FF</i>. <i>Default:</i> The color defined for the Highlight Set corresponding to the index value is used.
-original	Highlights the object in original color. This option is useful if you want to check a specific object more closely with the background dimmed. An object highlighted in original color will stand out in the dimmed background:  Note: This parameter cannot be used with <i>-index</i>, <i>-color</i>, or <i>-pattern</i>.
-pattern <i>patternValue</i>	Specifies the pattern value for the specified object. The pattern value is the same as the Stipple Value available through the Edit Highlight Color form. <i>Default:</i> The pattern (Stipple Value) for the Highlight Set corresponding to the index value is used.

Examples

- The following command highlights all selected objects with the same color and pattern as defined for the *Highlight Set #4* in the *View - Highlighted Selected* menu.

```
gui_highlight -index 4
```

- The following command highlights all selected objects with the color `green` and the pattern `dot4`. The index values is set to 5 and, therefore, the command will also change the definition of the *Highlight Set #5* (*View - Highlight Selected* menu) to have color `green` and pattern `dot4`.

```
gui_highlight -index 5 -color green -pattern dot4
```

- The following command highlights all selected objects with the color corresponding to the RGB hexadecimal value `#33FF66` and the pattern `horizontal`. The index values is set to 3 and, therefore, the command will also change the definition of the *Highlight Set #5* (*View - Highlight Selected* menu) to have color `#33FF66` and pattern `horizontal`.

```
gui_highlight -index 3 -color #33FF66 -pattern horizontal
```

Related Information

- [gui_clear_highlight](#)
- [gui_highlight_pin](#)

gui_highlight_pin

```
gui_highlight_pin  
[-help]  
-inst string  
-pin string  
[-original | -index indexValue ]  
[-original | -color colorValue ]  
[-original | -pattern patternValue ]
```

Highlights the shapes of all specified SIGNAL/POWER instance pins with the Highlight Set available through the *View - Highlight Selected* menu. The value for the index corresponds to the Highlight Set that will be applied. For example, a value of 4 for the index specifies that all selected objects will be highlighted with the same color and pattern as available for the *Highlight Set #4* in the *View - Highlight Selected* menu.

You can also provide a specific color and/or pattern to be used. All specified pins will be highlighted with the color and/or pattern that you specify.

Note: If you specify a color and or pattern, the Highlight Set corresponding to the index value will be updated to use the color and pattern specified. For example, if you specify an index value of 5, color `green`, and pattern `backslash`, the *Highlight Set #5* will get updated to have the color `green` and the pattern `backslash`.

Parameters

<code>-help</code>	Prints a brief description that includes the type and default information for each <code>gui_highlight_pin</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man gui_highlight_pin</pre>
<code>-color colorValue</code>	Specifies the color value for the specified object. The color value is the same as that available through the Edit Highlight Color form, which can be accessed by selecting <i>View - Edit Highlight Color</i>. You can also use the Red Green Blue (RGB) value in the following format: <code>#V1V2V3</code> where <code>V1</code>, <code>V2</code>, and <code>V3</code> are the hexadecimal values for the Red, Green, and Blue color components, respectively. For example, you can specify the value <code>#CC66FF</code>. Default: The color defined for the Highlight Set corresponding to the specified index value is used.
<code>-index indexValue</code>	Specifies the index value for the specified object. By default, all specified pins are highlighted with the same color and pattern as defined in the <i>Highlight Set</i> corresponding to the specified index value in the <i>View - Highlight Selected</i> submenu. For example, if you specify a value of 3 for index, all specified pins are highlighted with the same color and pattern as available for <i>Highlight Set #3</i> in the <i>View - Highlight Selected</i> submenu. Note: The <i>View - Highlight Selected</i> submenu provides eight highlight patterns. Therefore, the value of the index should be a number from 1 to 8.
<code>-inst string</code>	Specifies the name of instance.
<code>-original</code>	Highlights the instance pin in original color. This option is useful if you want to check a specific instance pin more closely with the background dimmed. An object highlighted in original color will stand out in the dimmed background. Note: This parameter cannot be used with <code>-index</code>, <code>-color</code>, or <code>-pattern</code>.
<code>-pattern patternValue</code>	Specifies the pattern value for the specified object. The pattern value is the same as the <i>Stipple</i> value available through the Edit Highlight Color form. Default: The pattern (<i>Stipple</i> value) defined for the Highlight Set corresponding to the specified index value is used.
<code>-pin string</code>	Specifies the name of SIGNAL/POWER pin to be highlighted. You can specify more than one pin name.

Examples

- The following command highlights the SIGNAL pins `E` and `D` of instance `U1` using the color yellow and the solid pattern:

```
gui_highlight_pin -inst U1 -pin {E D} -color yellow -pattern solid -index 1
```

- The following command highlights the SIGNAL pin `E` and the POWER pin `gnd` of instance `U1` using the color yellow and the solid pattern:

```
gui_highlight_pin -inst U1 -pin {E gnd} -color yellow -pattern solid -index 1
```

Related Information

- [gui_clear_highlight](#)
- [gui_highlight](#)
- [gui_highlight_pin_connection](#)

gui_highlight_pin_connection

```
gui_highlight_pin_connection
[-help]
-from_pin pin
[-mode {wire_segment | whole_net | flight_line}]
-to_pin pin
[-with_arrow | -select_only]
[-net_color_index index_value | -select_only]
[-inst_color_index index_value | -select_only]
```

Highlights the full timing path or its segment in the text format while generating the sign-off timing report. Use this command to quickly debug the timing path (timing point information) used in the tool.

Parameters

-help	Prints a brief description that includes the type and default information for each <code>gui_highlight_pin_connection</code> parameter. For a detailed description of the command and all its parameters, use the <code>man</code> command: <code>man gui_highlight_pin_connection</code>
-from_pin <i>pin</i>	Specifies the name of the starting pin to be highlighted.
-inst_color_index <i>index_value</i>	Specifies the instance color index value (an integer value from 1 to 64) for the specified timing path.
-mode {wire_segment whole_net flight_line}	Specifies the draw mode between the starting and ending pins.
-net_color_index <i>index_value</i>	Specifies the net color index value (an integer value from 1 to 64) for the specified timing path.
-select_only	Selects only the specified path for highlighting.
-to_pin <i>pin</i>	Specifies the name of the ending pin to be highlighted.
-with_arrow	Specifies whether or not the connection is defined with an arrow.

Example

The following command highlights a line drawn from the specified input pin to output pin while generating the sign-off timing report:

```
gui_highlight_pin_connection -from_pin ffa/Q -U7/A -mode flight_line
```

The timing report generated is shown below:

::::::Timing Report::::::::

:.....END:.....

The drawn layout along with the highlighted line is shown in the below picture:

gui_list_marker

`gui_list_marker`

Gives a list of GUI markers in the design layout.

Example

- The following command shows a list of GUI markers:

```
gui_list_marker
```

The following is displayed:

```
{name:aa  coordinate:(100.000 100.000)}
```

gui_open_schematic

```
gui_open_schematic
[-help]
[-name string]
[-type {module cone}]
[-objs <inst | net | pin | port | hinst>+ | -selected]
```

Opens the Schematic Viewer.

Parameters

-help	Prints out the command usage. For a detailed description of the command, use the <code>man</code> command: <code>man gui_open_schematic</code>
-name <i>string</i>	Specifies the unique window name for the schematic view to be opened.
-objs <inst net pin port hinst>+	
	Specifies the object(s) to be added in the schematic view. If multiple objects are specified, the Schematic Viewer can be opened only in the flattened mode (<code>-type cone</code>). As the default schematic mode is hierarchical, this means you must always specify <code>-type cone</code> when specifying multiple objects. Note: This option cannot be used with <code>-type module</code> . <i>Data_type:</i> (<i>inst/net/pin/port/hinst</i>)+, optional
- selected	Specifies that the selected object(s) are to be added in the schematic view. If multiple objects are selected, the Schematic Viewer can be opened only in the flattened mode (<code>-type cone</code>). As the default schematic mode is hierarchical, this means you must always specify <code>-type cone</code> when selecting multiple objects. Note: This option cannot be used with <code>-objs</code> or <code>-type module</code> . <i>Data_type:</i> bool, optional
-type {module cone}	Specifies the type of schematic to be opened. If you specify <code>cone</code> , the tool opens the Schematic Viewer to display schematic in the flattened mode. If you specify <code>module</code> , the tool opens the Schematic Viewer to display schematic in the hierarchical mode. <i>Default:</i> module <i>Data_type:</i> enum, optional

Examples

- The following command opens the schematic for the specified instance in the hierarchical mode:

```
gui_open_schematic -obj DTMF_INST/PLLCLK_INST
```

- The following command opens the schematic for the specified instance in the flattened mode:

```
gui_open_schematic -obj DTMF_INST/PLLCLK_INST -type cone
```

- The following opens the schematic for the selected object in the flattened mode:

```
gui_open_schematic -selected -type cone
```

- The following command opens the schematic for multiple selected objects in the flattened mode:

```
gui_open_schematic -selected -type cone
```

gui_pan

```
gui_pan
[-help]
dx
dy
```

Specifies that the new center of the viewing window should shift from the current center of the viewing window by (*x*, *y*) microns. Use this command at any stage in the design flow to pan or move the design view in a specific direction.

Parameters

- help	Prints a brief description that includes type and default information for each <code>gui_pan</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man gui_pan.</code>
dx	Specifies that the design center should shift <i>dx</i> microns on the x-axis from the center of the viewing window. You can specify positive or negative values for <i>dx</i> . A positive value specifies shifting to the right on the x axis.
dy	Specifies that the design center should shift <i>dy</i> microns on the y axis values from the center of the viewing window. You can specify positive or negative values for <i>dy</i> . A positive value specifies shifting up on the y axis.

Example

The following example shifts the design center to the right by 200 microns and down by 300 microns from the center of the viewing window.

```
gui_pan 200 -300
```

Related Information

- [gui_pan_center](#)
- [gui_pan_page](#)

gui_pan_center

```
gui_pan_center [-help] x y
```

Pans in the viewable window to the center point defined by the specified coordinates. Use this command at any stage of the design flow to view the design area around a specific point.

Parameters

- help	Prints a brief description that includes type and default information for each <code>gui_pan_center</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man gui_pan_center</code> .
x y	Specifies the x and y coordinates of the center point.

Example

The following command pans the viewable window to the center point (x=100, y=200)

```
gui_pan_center 100 200
```

Related Information

- [gui_pan](#)
- [gui_pan_page](#)

gui_pan_page

gui_pan_page [-help] x y

Pans the viewable window in pages defined by the offsets. The size of each page is equal to the size of the current viewable window. Use this command at any stage of the design flow.

Parameters

- help	Prints a brief description that includes type and default information for each <code>gui_pan_page</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man gui_pan_page</code>.
x y	Specifies <code>x</code> and <code>y</code> offsets to indicate number of pages to pan. A positive value of <code>x</code> specifies a pan of <code>x</code> pages to the right. A positive number of <code>y</code> specifies a pan of <code>y</code> pages toward the top. You can specify integer values for <code>x</code> and <code>y</code>.

Examples

- The following command pans the display to the right by one page
`gui_pan_page 1 0`
- The following command pans the display to the left by one page
`gui_pan_page -1 0`

Related Information

- [gui_pan](#)
- [gui_pan_center](#)

gui_redraw

`gui_redraw [-help]`

Refreshes the display in the viewable window. This command performs the same function as the *Redraw* icon (CTRL+R keyboard shortcut). You can use this command at any stage in the design flow.

Parameters

<code>-help</code>	Prints a brief description of the <code>gui_redraw</code> command. For a detailed description of the command, use the <code>man</code> command: <code>man gui_redraw</code> .
--------------------	--

gui_remove_marker

```
gui_remove_marker
[-help]
{-name <string> | -all }
```

Removes a marker from the design layout.

Parameters

-help	Outputs the command usage and a brief description about the command parameters.
-name <string>	Specifies the name of the marker to be removed from the design layout.
-all	Removes all markers from the design layout.

gui_report_ruler

`gui_report_ruler -help`

Reports the coordinates for all rulers in the main window.

- ✓ To check the ID of a ruler, select the *Create Ruler* widget and hover the cursor over the ruler – the ruler ID is displayed on the status bar, as shown below.

Parameters

<code>-help</code>	Prints a brief description of the <code>gui_report_ruler</code> command. For a detailed description of the command, use the <code>man</code> command: <code>man gui_report_ruler</code>
--------------------	---

Example

- The following command reports the coordinates of all rulers:

```
> gui_report_ruler
```

The command returns the ruler coordinates, as shown below:

```
{Ruler-1 coords: {248.4450 146.9800} {247.4550 12.6400}} {Ruler-0 coords: {13.8450  
226.4950} {87.9300 225.0150}}
```

Related Information

- `clear_all_rulers`
- `create_ruler`

gui_schematic_add_selected

```
gui_schematic_add_selected
[-help]
[-name window_name]
```

Adds the selected object to the current or specified schematic view.

Parameters

-help	Prints a brief description of the <code>gui_schematic_add_selected</code> command. For a detailed description of the command, use the <code>man</code> command: <code>man gui_schematic_add_selected</code>.
-name window_name	Specifies the unique window name for an open schematic view to which the selected object needs to be added. <i>Data_type</i>: string, optional

Related Information

- `gui_get_schematic`

gui_schematic_load_view

```
gui_schematic_load_view  
[-help]  
-file file_name  
[-name name]
```

Loads the specified schematic file.

 This commands work only in the cone view (flattened mode).

Parameters

-help	Prints a brief description of the <code>gui_schematic_load_view</code> command. For a detailed description of the command, use the <code>man</code> command: <code>man gui_schematic_load_view</code>.
-file <i>file_name</i>	Specifies the name of the schematic file to be loaded. <i>Data_type</i>: string, required
-name <i>name</i>	Specifies a unique window name for the opened schematic view. <i>Data_type</i>: string, optional

Related Information

- [gui_open_schematic](#)
- [gui_schematic_write_view](#)

gui_schematic_write_view

```
gui_schematic_write_view
[-help]
-file file_name
-name string
```

Saves the current schematic view into the specified file.

 This commands work only in the cone view (flattened mode).

Parameters

-help	Prints a brief description of the <code>gui_schematic_write_view</code> command. For a detailed description of the command, use the <code>man</code> command: <code>man gui_schematic_write_view.</code>
-file <i>file_name</i>	Specifies the name of the file in which to save the schematic view. <i>Data_type</i> : string, required
- name <i>string</i>	Specifies the name of the schematic view. <i>Data_type</i> : string, required

Related Information

- `gui_open_schematic`
- `gui_schematic_load_view`

gui_select

```
gui_select
[-help]
{-point {x y} |
-line {x1 y1 x2 y2} |
-rect {x1 y1 x2 y2}}
[-toggle | -append | -next]
[-point {x y} [-next ]]
```

Selects objects as per the parameters you specify. Use `-point` to select the object at the specified coordinate, `-line` to select the objects through which the specified line passes, or `-rect` to select the objects falling within the specified box coordinates.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>gui_select</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man gui_select</code>
<code>-append</code>	Appends the selection. This is equivalent to pressing the <code>Shift</code> key while selecting an object using the GUI.
<code>-line {x1 y1 x2 y2}</code>	Selects by line. Use this parameter to select the objects through which the specified line passes.
<code>-next</code>	Steps to next object under point. This is same as using space bar while selecting an object using the GUI.
<code>-point {x y}</code>	Selects the object at the specified point.
<code>-rect {x1 y1 x2 y2}</code>	Selects by box. Use this parameter to select the objects falling within the specified rectangular area.
<code>-toggle</code>	Toggles the selection. This is equivalent to pressing the <code>Ctrl</code> key while selecting an object using the GUI.

Examples

- The following command selects the objects that are totally enclosed within the box defined by the coordinates ($x = 10$, $y = 200$) and ($x = 100$, $y = 50$):
`gui_select -rect {10 200 100 50}`
- The following command selects all the objects falling across the specified line coordinates:
`gui_select -line {168.654 994.049 688.129 436.224}`
- The following command selects the objects crossed by the specified line and appends them to the current selection:
`gui_select -line {169.622 996.049 698.290 446.240} -append`
- The following command toggles the selection on the objects in the specified bounding box. If the objects are previously selected, the command deselects them and vice versa:
`gui_select -rect {10 200 100 50} -toggle`

Related Information

- `deselect_obj`
- `gui_deselect`
- `select_obj`

gui_select_highlighted

```
gui_select_highlighted
[-help]
[-type string]
```

Selects highlighted objects. If `-type` is specified, selects highlighted objects of the specified type.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>gui_select_highlighted</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man gui_select_highlighted</pre>
<code>-type <i>string</i></code>	Specifies the type of the highlighted objects to be selected. Options are <code>instance</code>, <code>wire</code>, and <code>via</code>.

Examples

- The following command selects all highlighted instances.

```
gui_select_highlighted -type instance
```

Related Commands

- `gui_highlight`
- `gui_select`

gui_set_obj_color

```
gui_set_obj_color  
[-help]  
{[-obj_name InstOrHInstName | -obj_type typeList]  
[-multicolor | -color_id colorID]  
[-include_children {off | color | multicolor}]  
[-reset]}
```

Sets the color for objects of the specified name or type. You can choose to include children when specifying object color for a hierarchical instance (HInst).

The `gui_set_obj_color` command is typically used during floorplanning to color objects that are currently displayed in the design display area. You can use this command to distinguish between objects of different type or between objects belonging to different instances, hierarchical instances, instance groups, or power domains.

Before using the `gui_set_obj_color` command, you should have:

- Loaded the floorplan
- Ungrouped objects so that only required objects are displayed in the design display area in the Floorplan or Physical view.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>gui_set_obj_color</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man gui_set_obj_color</code>.
<code>-color_id colorID</code>	Specifies the color ID from 0 to 29. The color value for the color ID is the same as specified in the Module Color Preference form (accessed by clicking <i>Floorplan - Edit Floorplan - Color Module</i>). <i>Default:</i> Color ID 0
<code>-include_children</code> { <code>off</code> <code>color</code> <code>multicolor</code> }	Specifies whether the children of the hierarchical instance will be colored simultaneously when you specify a color for an HInst. You can set one of the following options: • <code>off</code>: The child instances will not be colored. • <code>color</code>: The child instances are colored the same color as their parent instance. • <code>multicolor</code>: The child instances are colored in multiple colors.
<code>-multicolor</code>	Uses multiple colors to color objects of the specified type, instance, or hierarchical instance.
<code>-obj_name</code> <i>InstOrHInstName</i>	Specifies the name of the instance, hierarchical instance, power domain, or instance group whose objects are to be colored. You can specify an object list, such as <code>objectName {A,B}</code>.
<code>-obj_type</code> <i>typeList</i>	Specifies the list of type of objects that are to be colored, such as <code>SDP</code>, <code>BusGuide</code>, <code>Module</code>, <code>PowerDomain</code>, and <code>InstGroup</code>.
<code>-reset</code>	Resets the object color.

Example

- The following command colors all SDP objects in multiple colors:
`gui_set_obj_color -obj_type SDP -multicolor`
- The following command colors the `DTMF_INST/TDSP_CORE_INST` instance with color 3, as specified in the Module Color Preference form:
`gui_set_obj_color -obj_name DTMF_INST/TDSP_CORE_INST -color_id 3`
- The following command colors the `DTMF_INST/TDSP_CORE_INST` instance and its children with color

3, as specified in the Module Color Preference form:

```
gui_set_obj_color -obj_name DTMF_INST/TDSP_CORE_INST -color_id 3 -include_children color
```

- The following command colors the children of the `DTMF_INST/TDSP_CORE_INST` instance in multiple colors:

```
gui_set_obj_color -obj_name DTMF_INST/TDSP_CORE_INST -include_children multicolor
```

gui_set_power_rail_display

```
gui_set_power_rail_display
[-help]
[-enable_result_browser {true | false}]
[-enable_rlrp {true | false}]
[-enable_voltage_sources {true | false}]
[-filter_max max_value]
[-filter_min min_value]
[-legend {off ne nw se sw}]
[-plot plot_type]
[-range_max max_value]
[-range_min min_value]
[-reset_color_scale {true | false}]
[-filter_color {on | off | color_name}]
[-enable_percentage_range {true | false}]
[-thermal_layer_name thermal_layer]
[-tile_count_x value]
[-tile_count_y value]
[-tile_size_x value]
[-tile_size_y value]
[-customized_range {value1 value2 ... value9}]
[-grid {on | off}]
[-enable_auto_apply {true | false}]
```

Controls the display of the main window widgets, such as legend, result browser, voltage source, filter range, and RLRP path.

Parameters

- help	Outputs a brief description that includes type and default information for each <code>gui_set_power_rail_display</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man gui_set_power_rail_display.</code>
-customized_range { <i>value1 value2 ... value9</i> }	

	Specifies the color scale range values for the 8 filters between the minimum and maximum values of the color gradient based (<i>Basic</i>) filter. The value list must contain 9 values. The filter ranges for the 8 buckets are evenly divided by default. This parameter can be used to customize the filter ranges. You can either modify the color range using the GUI (Basic button) or the <code>-customized_range</code> parameter. Example: <pre>gui_set_power_rail_display -plot ir -customized_range { 1 10 12 13 14 15 16 17 49 }</pre>
	<pre>-enable_auto_apply {true false}</pre>
	Specifies to automatically redraw the layout after modifying the color scale range values. This parameter allows you to enable/disable the <i>Auto Apply for Color Scale</i> checkbox of the Power Rail Plots form using the Tcl script instead of the GUI option. The default value of this parameter is <code>false</code>.
	<pre>-enable_percentage_range {true false}</pre>
	Specifies to display the color gradients for the following plots by percentage in the GUI: • IR Drop • IVDD • IVDN The percentage value is based on the nominal voltage value of each rail/instance. It displays high percentage voltages in red and low percentage voltages in blue. <i>Default:</i> <code>false</code>
	<pre>-enable_result_browser {true false}</pre>
	When set to <code>true</code> it enables the result browser. <i>Default:</i> <code>false</code>
	<pre>-enable_rlrp {true false}</pre>
	When set to <code>true</code> it enables the display of the RLRP path. The rail analysis must include RLRP analysis (<code>set_rail_analysis_config -enable_rlrp_analysis true</code>) in order to have the required data for this functionality. <i>Default:</i> <code>false</code>
	<pre>-enable_voltage_sources {true false}</pre>
	Displays voltage sources (power pads) using white pixels in the layout canvas. <i>Default:</i> <code>false</code>

<code>-filter_color {on off color_name}</code>	
	Allows to set the color of the filtered out resistors specified using the scissor filter range. By default, the filtered resistors are not displayed. If you want to view these resistors, you can use this parameter to enable the visibility of resistors and set desired colors for them. The valid values of this parameter are: • <code>on</code> – enables the visibility of the filtered out resistors. • <code>off</code> - disables the visibility of the filtered out resistors. • <code>color_name</code> - enables the visibility of filtered out resistors and set the color of resistors per the specified color name.
<code>-filter_max max_value</code>	
	Specifies the maximum value of the scissor filter range that will be plotted. You can use the scissor filter range to filter out the resistors and nodes that you do not want to view, and obtain statistics only for the instances in the specified filter range. Optional, but if specified, the <code>-plot</code> option is required, and requires both <code>-filter_min</code> and <code>-filter_max</code> to be specified.
<code>-filter_min max_value</code>	
	Specifies the minimum value of the scissor filter range that will be plotted. Optional, but if specified, the <code>-plot</code> option is required, and requires both <code>-filter_min</code> and <code>-filter_max</code> to be specified.
<code>-grid {on off}</code>	
	Allows you to control the grid display when viewing the Voltage Source Current (VC) and Voltage across Package Model (VU) plots. The default value of this parameter is <code>on</code>. You can set this parameter to <code>off</code> to hide the grid view for better display and easier analysis of the plot data.
<code>-legend {off ne nw se sw}</code>	
	Displays the filter color and range details. When you set <code>set_power_rail_display -legend</code> to one of the location (<code>ne nw se sw</code>), this opens the legend at the specified location on the design layout. Use <code>set_power_rail_display -legend off</code> to close the legend. <i>Default:</i> <code>off</code>.
<code>-plot plot_type</code>	
	Plots the specified plot type. See Plot Types for a description of each of the plot types.
<code>-range_max max_value</code>	

	Specifies the maximum value of the color scale. Optional, but if specified, the <code>-plot</code> option is required, and requires both <code>-range_min</code> and <code>-range_max</code> to be specified.
<code>-range_min min_value</code>	
	Specifies the minimum value of the color scale. Optional, but if specified, the <code>-plot</code> option is required, and requires both <code>-range_min</code> and <code>-range_max</code> to be specified.
<code>-reset_color_scale {true false}</code>	
	Specifies to reset the maximum (<code>-range_max</code>) and minimum (<code>-range_min</code>) values of the color scale to the default plot data values. For example, when you specify <code>-plot ir</code>, the default value for <code>-range_min</code> is 0 and <code>-range_max</code> is 100. You can modify the color scale, such as set <code>-range_min</code> to 0 and <code>-range_max</code> to 20. To reset the color scale of the IR drop plot to default, you can specify the <code>-reset_color_scale</code> parameter.
<code>-thermal_layer_name thermal_layer</code>	
	Displays the specified layer of the temperature map. Example: <pre>set_power_rail_display -thermal_layer_name VIA_7</pre>
<code>-tile_count_x value</code>	
	Specifies the number of tiles in the x direction. This parameter is used to resize the tile power density plot. You can either specify the tiles by count (<code>tile_count_x</code> and <code>tile_count_y</code>) or specify the tiles by size (<code>tile_size_x</code> and <code>tile_size_y</code>). When you resize the tile power density (<code>tpd</code>) plot in the batch or GUI mode, the software automatically invokes the <code>report_power</code> command and resizes the plot. This feature allows you to resize the <code>tpd</code> plot without having to restore the power database (<code>power.db</code>) again. The following is an example of specifying tiles by size in the batch mode: <pre>report_power -out_file tiles_count.rpt -power_density_tiles_row_col {100 100} set_power_rail_display -plot tpd -tile_size_x 100 -tile_size_y 100</pre>
<code>-tile_count_y value</code>	
	Specifies the number of tiles in the y direction. This parameter must be specified with the <code>tile_count_x</code> parameter.
<code>-tile_size_x value</code>	

	Specifies the horizontal dimension of each tile polygon in um. This parameter is used to resize the tile power density plot. You can either specify the tiles by count (<code>tile_count_x</code> and <code>tile_count_y</code>) or specify the tiles by size (<code>tile_size_x</code> and <code>tile_size_y</code>). When you resize the tile power density (<code>tpd</code>) plot in the batch or GUI mode, the software automatically invokes the <code>report_power</code> command and resizes the plot. This feature allows you to resize the <code>tpd</code> plot without having to restore the power database (<code>power.db</code>) again. The following is an example of specifying tiles by size in the batch mode: <pre>report_power -out_file tiles_count.rpt -power_density_tiles_row_col {100 100} set_power_rail_display -plot tpd -tile_size_x 100 -tile_size_y 100</pre>
	<code>-tile_size_y value</code>
	Specifies the vertical dimension of each tile polygon in um. This parameter must be specified with the <code>tile_size_x</code> parameter.

Plot Types

Plot Type	Description
<code>ac</code>	Available/feasible capacitance (Farad) Displays the feasible decoupling capacitance that can be added in the area. The feasible capacitance in the area is calculated based on the filler cells placement. The program matches the placed filler cells with the decap cells available in the power-grid library and computes the feasible capacitance. The capacitance of the decap cell is stored in the power-grid library.
<code>cap</code>	Ggrid capacitance (Farad) Plots the capacitance of the extracted power-grid network.
<code>cvil</code>	Customized File 1 Plots the user-specified instance voltage file.
<code>dd</code>	Decoupling capacitance (decap) density (Farad/um²) Plots decap density of the design. The decap density is the cell internal decoupling capacitance in the unit area (um²).

dr	Decoupling capacitance required Reports the decoupling capacitance required to fix dynamic IR-drop violations. This option suggests how much decap needs to be added in a given area to fix the IR-drop violations.
effr	Effective resistance (ohm) - instance based Display the effective resistance results for all instances.
node_reff	Effective resistance (ohm) - node based Display the effective resistance results for all nodes.
ipc	Instance Peak Current Display the peak current of each instance.
ivdn	Instance Voltage Drop (Volts) – net-based Plots the net-based instance voltage drop.
ivdd	Instance Voltage Drop (Volts) – domain-based Plots the domain-based instance voltage drop. For domain based, at least one power and one ground net must be selected.
fd	Filler cell density ($1/\mu\text{m}^2$) Displays the filler cell density per unit area (μm^2). The plot can be used to analyze the feasibility of adding decap cells by replacing the filler cells and not changing the placement of the logic cells.
freq	Frequency domain (Hz) Displays the associated clock frequency of all instances in the design. The instances associated with multiple clock domains are displayed using the fastest clock frequency. This plot can be used to analyze and debug the power distribution in the design.
ip	Instance total power (mW) The total power consumed by each instance is displayed. The total power is the sum of the internal, switching and leakage power of the instance. The power data is read from the power database and can be specified using the <code>-power_db</code> option or it is queried directly from memory, if power calculation is run during the session.
ip_i	Instance internal power (mW) The power consumed by charging and discharging of the internal interconnect and device capacitances of the instance.

ip_l	Instance leakage power (mW) The power consumed by devices when not switching.
ip_s	Instance switching power (mW) The power consumed by charging and discharging of the interconnect or output load.
ipd_i	Specifies internal power density in $\text{mW}/\mu\text{m}^2$.
ipd_l	Specifies leakage power density in $\text{mW}/\mu\text{m}^2$.
ipd_s	Specifies switching power density in $\text{mW}/\mu\text{m}^2$.
ipd_t	Specifies total power density in $\text{mW}/\mu\text{m}^2$.
ir	IRdrop or voltage drop (Volts) Displays the IRdrop across each extracted power-grid segment in the design.
jrms	Specifies current density as j/j_{max} based on the I_{rms} current. This plot is only supported for dynamic analysis. A j_{rms} gif file will be saved in the state directory that shows where the I_{rms} based EM violation occurred. This plot type allows you to verify the analysis results of "jrms" using the GUI.
load	Loading capacitance (Farad) Displays the output loading capacitance driven by the instance. This plot can be used to analyze and debug the regions with high switching power.
pi	Power-switch (gate) current violation: I/I_{dsat} Displays the ratio of current through the power-switch and the saturation current (I_{dsat}) of the power-switch. This plot can be used to analyze and debug whether the current through power-switches exceeds the saturation current characterized for the power-switch devices. The saturation current and on-resistance of the power-switches are characterized and stored inside the power-grid library of the power-switch cell. A ratio of greater than 1 means that the current requirement of the power-gated block can not be met with placed power-switch instance. Either the power-switch needs to be made larger or power-switch instances need to be added.

pv	Voltage drop across power-switch (Volt) Displays the IRdrop across power-switch instances. This plot can be used to analyze and debug the IRdrop inside the power-gated block, e.g. if the IRdrop across power-switches is already high, the IRdrop inside the power-gated block will be much higher. In this case, the power-switch placement will have to be refined in order to resolve the IRdrop problem.
rc	Resistor current (Amp) Displays the current across power-grid resistor segments. This plot can be used to analyze and debug how the current flows from the voltage sources into the rest of the design, e.g. high current should flow from pads to the top-level routing level layers and then to the lower level metal layers. This plot can also be used to debug current density violations (<code>rcj</code>).
rlrp	The total resistance of the instance along the least resistive path. Displays the total resistance of the instance along the least resistive path, meaning the resistance of the instance along the path from where it gets the most amount of current. This plot can be used to analyze and debug the power-grid integrity early in the design stage. An instance with high resistance is likely to have high static or dynamic IRdrop depending on the vector that is simulated later in the design cycle. This plot can be also used during decap optimization, since regions with high dynamic IRdrop and high resistance may not be improved upon by adding decaps, because the effectiveness of decoupling capacitance depends on the resistance of the power-grid network. The plot displays the RLRP paths for power (purple color) and ground (white color) nets in different colors for the identification of paths and ease of analysis. You can also highlight the least resistive path of the instance using the GUI and selecting the instance with left mouse button. The <i>RLRP Path</i> checkbox should be enabled.
res	Grid resistance (ohm) Displays the total resistance of the least resistive path from each node to voltage source. This plot can be used to view high resistance regions of the power-grid. It is useful during IRdrop and decap analysis to identify weak power-grid connectivity. The GUI also allows you to view the resistor-based RLRP path. To view the resistor-based RLRP path: 1. Select the <code>res</code> Rail plot, and the <i>RLRP Path</i> checkbox. 2. Select a resistor. The GUI highlights the least effective resistance path to the nearest voltage source, and opens the <i>Resistance Path</i> form.

rj	Resistor current density, J/Jmax. Displays the current density (current per unit area) violation on each power-grid segment using the ratio of calculated current density and maximum allowed current density. A ratio of greater than 1 means that the current density limit of the segment is violated. The current density limits are supplied by the foundry and can be read during analysis using the <code>set_rail_analysis_config -em_models</code> command.
rs	Specifies the plot type for resistor sensitivity.
sem_avg	Average Current Density Displays average current limit violations in the design. This plot is enabled when you specify <code>check_ac_limits -method avg</code>.
sem_peak	Peak Current Density Displays peak current limit violations in the design. This plot is enabled when you specify <code>check_ac_limits -method peak</code>.
sem_rms	RMS Current Density Displays RMS current limit violations in the design. This plot is enabled when you specify <code>check_ac_limits -method rms</code>.
slack	Instance slack (Seconds) Displays worst instance slack. The slack data is queried from either the timing database or if the power database is specified using <code>-power_db</code> option, then the worst slack data is read from the power database. When using an external TWF, the slack data is read from the TWF.
tc	Tap current (Amp) Displays the current consumed by the instance devices or current taps. During rail analysis, it is based on the power consumption of the instance and is distributed inside the cell. The current distribution inside the cell is based on the extracted device netlist stored inside the power-grid library of the cell. The current distribution is generally based on the device width, length, and spice models. This plot can be used to analyze and debug IRdrop inside the macro.
td	Transition density (Hz) Displays the worst transition density (activity * frequency) of the instance. This plot can be used to analyze and debug activity distribution and high power density regions.

thermal	Instance thermal Displays the instance temperature distribution for the chip. The plot shows tile-based temperature for instances. When you click on an instance, the <i>Attribute Viewer</i> window opens and displays the instance temperature in the <i>Thermal</i> field.
unc	Unconnected segments Displays power-grid segments that are disconnected from the voltage source (power pads). This plot can be used to debug unusually high IRdrop in the region.
vc	Voltage source current (Amp) Displays current through the voltage sources (power pads). This plot can be used to analyze the current carrying capacity of the power-pad.
vu	Voltage drop across package (Volt) Displays voltage drop across package. If analysis is run with package model attached to the power pads, this plot displays the IRdrop due to package RLCK elements.

Examples

- The following command specifies that `div` data will be plotted without loading design DEF:

```
gui_set_power_rail_display\  
-plot div
```
- The following command enables the visibility of the filtered out resistors without changing the color:

```
gui_set_power_rail_display -filter_color on
```
- The following command enables the visibility of the filtered out resistors and also changes the color to red:

```
gui_set_power_rail_display -filter_color red
```

  -disable_visible_signal_em_layers {all|layer_names} ]
[-show_layer_net_setting_list {true | false}]
[-via_size {1 | 2 | 3 | 4 | 5 | 6}]
```

Controls the visibility of the layers, the opacity of the rail analysis or design database, and the visibility of power/ground nets.

Parameters

- help	Outputs a brief description that includes type and default information for each <code>gui_set_power_rail_layers_nets</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man gui_set_power_rail_layers_nets</code> .
-design_opacity value	
	Specifies the design opacity value for the design database. The opacity range is from 0-100%, the default value is 60.
-disable_nets {names}	

	Hides the specified nets. This parameter is mutually exclusive to the <code>-enable_nets</code> and <code>-nets</code> parameters.
<code>-disable_report_layers {all layer_names}</code>	
	Hides the report (user-defined layers to be used for processing) layers. You can use <code>all</code> to hide all layers, or list the specific layers that are not to be displayed. This parameter is mutually exclusive to the <code>-enable_report_layers</code> and <code>-layers</code> parameters.
<code>-disable_switch_nets {all net_names}</code>	
	Hides the specified switch nets. You can use <code>all</code> to hide all the switch nets, or list the specific switch nets that are not to be displayed. This parameter is mutually exclusive to the <code>-enable_switch_nets</code> parameter.
<code>-disable_visible_layers {all layer_names}</code>	
	Specifies which layers should not be made visible when plotting. You can use <code>all</code> to hide all layers, or list the specific layers that are not to be displayed. This parameter is mutually exclusive to the <code>-enable_visible_layers</code> and <code>-layers</code> parameters.
<code>-disable_visible_signal_em_layers {all layer_names}</code>	
	Specifies which signal EM layers should not be made visible when plotting. You can use <code>all</code> to hide all layers, or list the specific layers that are not to be displayed. This parameter is mutually exclusive to the <code>-enable_visible_signal_em_layers</code> parameter.
<code>-enable_nets {names}</code>	
	Displays only the specified nets. This parameter is mutually exclusive to the <code>-disable_nets</code> and <code>-nets</code> parameters.
<code>-enable_report_layers {all layer_names}</code>	
	Specifies to select the user-defined layers to be used for processing. You can use <code>all</code> to select all layers, or list the specific layers that are to be selected. This parameter is mutually exclusive to the <code>-disable_report_layers</code> and <code>-layers</code> parameters.
<code>-enable_switch_nets {all net_names}</code>	

	Displays the specified switch nets. You can use <code>all</code> to display all the switch nets, or list the specific switch nets that are to be displayed. This parameter is mutually exclusive to the <code>-disable_switch_nets</code> parameter.
<code>-enable_visible_layers {all layer_names}</code>	
	Specifies which layers should be made visible when plotting. You can use <code>all</code> to display all layers, or list the specific layers that are to be made visible. This parameter is mutually exclusive to the <code>-disable_visible_layers</code> and <code>-layers</code> parameters.
<code>-enable_visible_signal_em_layers {all layer_names}</code>	
	Specifies which signal EM layers should be made visible when plotting. You can use <code>all</code> to select all layers, or list the specific layers that are to be selected. This parameter is mutually exclusive to the <code>-disable_visible_sem_layers</code> parameter.
<code>-instance_voltage_method {Worst Best Avg WorstAvg}</code>	
	Allows different methods of computing effective instance voltage during rail analysis. Using this option, you can write out the Best, Worst, or Average effective instance voltage between power and ground nets. The WorstAvg method computes the average instance voltage during each evaluation window defined by the IV Window field, and reports the worst average instance voltage out of all the windows. If IV Method is WorstAvg and IV Window is whole, then this method will report average voltage across all time steps in simulation. Default : Worst
<code>-instance_voltage_window {timing/switching whole}</code>	
	Controls the window where effective instance voltage (EIV) is evaluated. EIV is obtained by processing the voltage waveforms and finding the worse-case effective voltage between the power and ground pins during a specific window. There are two possible options to evaluate EIV: • <code>timing/switching</code> – both switching activity (current is non-leakage) and timing window • <code>whole</code> – entire rail simulation not filtered to a specific window
<code>-layers {{name report0/1 visible0/1}}{...}}</code>	

Controls the visibility of layers. You can enable or disable the reporting and visibility of specific layer. For example, `-layer {{M1 1 1} {M2 0 0}}` means enable reporting and visibility of layer M1, and disable reporting and visibility of layer M2

This parameter is mutually exclusive to the `-disable_report_layers`, `-disable_visible_layers`, `-enable_visible_layers`, and `-enable_report_layers` parameters.

`-nets {{all_power 0/1}{all_ground 0/1}}`

Controls the display of all the power and ground nets.

When `all_power` is set to 0, hides all power nets, and when set to 1, displays all power nets. When `all_ground` is set to 0, hides all ground nets, and when set to 1, displays all ground nets.

This parameter is mutually exclusive to the `-enable_nets` and `-disable_nets` parameters.

`-rail_analysis_opacity value`

Specifies the opacity value for the rail analysis output.

The opacity range is from 0-100%, the default value is 100.

`-show_layer_net_setting_list {true | false}`

Displays the current status (OFF/ON) of all layers and nets in the console. The following is an example of the output:

```
#-----#
# Layers    Report    Visible #
# RD        ON        ON #
# M0        ON        ON #
# .....
#-----#
# PowerNets  Status #
# VDD        ON #
# VDDm       ON #
#-----#
# GroundNets Status #
# VSS        ON #
#-----#
```

`-via_size {1 | 2 | 3 | 4 | 5 | 6}`

Specifies to modify and control the size of vias in the GUI. The default via size is 1. The possible via size values are 1, 2, 3, 4, 5, and 6.
--

Examples

- The following command specifies the layers that will be visible:

```
gui_set_power_rail_layers_nets \  
-enable_visible_layers{RD M1 V12 M2 V23 M3 V34 M4 V45 M5 V56 M6} \  
-enable_nets {vdd vdd_1}
```

- The following commands describe the use model for enabling and disabling switch nets. Here, consider a net `VDD` with three switch nets `VDD_sw0`, `VDD_sw1`, and `VDD_sw2`:

- The following command hides the switch net `VDD_sw0`:

```
set_power_rail_layers_net -disable_switch_nets {VDD {VDD_sw0}}
```

Displays `VDD_sw1` and `VDD_sw2`.

- The following command hides all the switch nets:

```
set_power_rail_layers_net -disable_switch_nets {VDD {all}}
```

- The following command displays the switch net `VDD_sw0`:

```
set_power_rail_layers_net -enable_switch_nets {VDD {VDD_sw0}}
```

- The following command displays all the switch nets:

```
set_power_rail_layers_net -enable_switch_nets {VDD {all}}
```

Related Topics

- ["Static Power, IRdrop and EM Analysis"](#) in the *Voltus User Guide*

- The following commands describe the use model for enabling and disabling switch nets. Here, consider a net `VDD` with three switch nets `VDD_sw0`, `VDD_sw1`, and `VDD_sw2`:
 - The following command hides the switch net `VDD_sw0`:
`set_power_rail_layers_net -disable_switch_nets {VDD {VDD_sw0}}`
Displays `VDD_sw1` and `VDD_sw2`.
 - The following command hides all the switch nets:
`set_power_rail_layers_net -disable_switch_nets {VDD {all}}`
 - The following command displays the switch net `VDD_sw0`:
`set_power_rail_layers_net -enable_switch_nets {VDD {VDD_sw0}}`
 - The following command displays all the switch nets:
`set_power_rail_layers_net -enable_switch_nets {VDD {all}}`

gui_set_tool

```
gui_set_tool [-help] mode
```

Selects specified tool widget in the main window and enters interactive mode.

Parameters

- help	Prints a brief description that includes type and default information for each <code>gui_set_tool</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man gui_set_tool</code>.
<code>mode {select move ruler util cut obstruct layerBlk ptnFeed ptnPinBlk ptnPinGuide addWire addVia moveWire cutWire stretchWire addPoly addBusGuide p2pRoute}</code>	
	Specifies the interactive mode to enter. The following modes are supported: • <code>select</code> - Chooses the Select tool widget in the main window. • <code>move</code> - Selects the Move/Resize/Reshape tool widget in the main window. • <code>ruler</code> - Selects the Create Ruler tool widget in the main window. • <code>util</code> - Selects the Query Area Density tool widget in the main window. • <code>cut</code> - Selects the Cut Rectilinear tool widget in the main window. • <code>obstruct</code> - Selects the Create Placement Blockage widget in the main window. • <code>layerBlk</code> - Selects the Create Routing Blockage tool widget in the main window. • <code>ptnFeed</code> - Selects the Create Physical Feedthrough tool widget in the main window. • <code>ptnPinBlk</code> - Selects the Create Pin Blockage tool widget in the main window. • <code>ptnPinGuide</code> - Selects the Create Pin Guide tool widget in the main window. • <code>addWire</code> - Selects the Edit Wire tool widget in the main window. • <code>addVia</code> - Selects the Add Via tool widget in the main window. • <code>moveWire</code> - Selects the Move Wire tool widget in the main window. • <code>cutWire</code> - Selects the Cut Wire tool widget in the main window. • <code>stretchWire</code> - Selects the Stretch Wire tool widget in the main window. • <code>addPoly</code> - Selects the Add Polygon tool widget in the main window. • <code>addBusGuide</code> - Selects the Edit Bus Guide tool widget in the main window. • <code>p2pRoute</code> - Selects the Point to Point Route tool widget in the main window.

Example

The following command is used to enter the Create Ruler mode in the design window.

```
gui_set_tool ruler
```

gui_set_ui

```
gui_set_ui
[-help]
name
[-before name]
[-checked {true | false}]
[-command string]
[-disabled {true | false}]
[-enable_variable string]
[-foreground string]
[-geometry string | -full_screen {true | false}]
[-icon filename]
[-in name]
[-label string]
[-message string]
[-movable {true | false}]
[-menu_separate {true | false}]
[-newline {true | false}]
[-shortcut string]
[-statusbar string]
[-title string]
[-titlebar_color string]
[-tooltip string]
[-underline integer]
[-value string ]
[-variable string]
[-visible {true | false}]
[-visible_variable string]
```

Sets the specified property of an element. Use this command to customize the tool's graphical interface by configuring various interface elements, such as submenus and commands. The properties that can be set for a specific element depends on the `type` of that element. To see the list of properties that can be set for each type, see the "Accepted Properties for Each Type" section below.

For elements of type `menu`, `submenu`, `command`, `check`, `radio`, `separator`, `toolbar`, and `toolbutton`, the `gui_set_ui` command works like the tk command `widgetconfigure`. For the main window (`main`), it works like the tk command `wm`.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>gui_set_ui</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man gui_set_ui</pre>
<code>name</code>	Specifies the name of the element whose property is to be set. An error is returned if specified <code>name</code> does not exist. <i>Data_type</i>: string, required
<code>-before name</code>	Sets the specified element before the element identified by <code>name</code>. <i>Data_type</i>: string, optional
<code>-checked {true false}</code>	Checks or unchecks the specified element. Note: You can use the <code>-checked</code> parameter only for elements of type <code>check</code> or <code>radio</code>. <i>Data_type</i>: bool, optional
<code>-command string</code>	Specifies the Tcl command to be executed when the specified element is invoked. Note: You can use the <code>-command</code> parameter only if you are adding elements of type <code>command</code>, <code>check</code>, <code>radio</code> or <code>toolbutton</code>. <i>Data_type</i>: string, optional
<code>-disabled {true false}</code>	Disables or enables the specified interface element. Note: You can use the <code>-disabled</code> parameter only for elements of type <code>menu</code>, <code>submenu</code>, <code>command</code>, <code>check</code>, <code>radio</code> or <code>toolbutton</code>. The parameter is NOT applicable for elements of type <code>toolbar</code> and <code>separator</code>. <i>Data_type</i>: bool, optional
<code>-enable_variable string</code>	Sets the Tcl global variable for Enable status. <i>Data_type</i>: string, optional
<code>-foreground string</code>	Specifies the foreground color of the icon of the specified interface element. Note: You can use the <code>-foreground</code> parameter only if you are adding an element of type <code>toolbutton</code>. <i>Data_type</i>: string, optional
<code>-full_screen {true false}</code>	

	Maximizes the main window. This property can be set only for the element <code>main</code>. Note: This option cannot be used with <code>-geometry</code>. <i>Data_type:</i> bool, optional
<code>-geometry string</code>	Modifies the geometry of the specified window element. <i>Data_type:</i> string, optional
<code>-icon filename</code>	Specifies the file name of the toolbar icon. <i>filename</i> can be the full path of the icon file or an icon name supported by the tool. The icon names used in the tool can be queried using the <code>gui_get_ui</code> command. For list of supported image formats for the icon file, see the "Supported Image Formats" section of the Customizing the User Interface chapter in the <i>User Guide</i>. Note: The <code>-icon</code> parameter is applicable only for elements of type <code>toolbar</code>. <i>Data_type:</i> string, optional
<code>-in name</code>	Specifies the name of the parent element. <i>Data_type:</i> string, optional
<code>-label string</code>	Specifies the label to be displayed on the element being modified. Note: This parameter is NOT applicable for elements of type <code>separator</code>. <i>Data_type:</i> string, optional
<code>-message string</code>	Specifies the message to be displayed on the element being modified. Note: This parameter is applicable for elements of type <code>statusbar</code>. <i>Data_type:</i> string, optional
<code>-menu_separate {true false}</code>	

	Specifies whether or not a menu or submenu can be torn off or detached. - When set to <code>true</code> (default), a dashed line appears at the top of the menu or submenu to indicate that it can be detached. - When set to <code>false</code>, the dashed line no longer appears at the top of the menu or submenu and it cannot be detached. Note: This parameter is applicable for elements of type <code>menu</code> and <code>submenu</code>. <i>Data_type:</i> bool, optional
<code>-movable {true false}</code>	Specifies whether or not the element being modified should be movable. Note: The <code>-movable</code> parameter is applicable only for elements of type <code>toolbar</code>. <i>Data_type:</i> bool, optional
<code>-newline {true false}</code>	Specifies whether or not the element being modified should be on a new row. Note: The <code>-newline</code> parameter is applicable only for elements of type <code>toolbar</code>. <i>Data_type:</i> bool, optional
<code>-shortcut string</code>	Specifies the shortcut key for a command, check box, radio button, or toolbutton. Note: You can use the <code>-shortcut</code> parameter only if you are modifying elements of type <code>command</code>, <code>check</code>, <code>radio</code>, or <code>toolbutton</code>. <i>Data_type:</i> string, optional
<code>-statusbar string</code>	Sets the statusbar of the specified window element. <i>Data_type:</i> string, optional
<code>-title string</code>	Specifies the window title. <i>Data_type:</i> string, optional
<code>-titlebar_color string</code>	Sets the color of the title bar of the window. Note: This parameter is applicable only for the main window (<code>main</code>). <i>Data_type:</i> string, optional

<code>-tooltip <i>string</i></code>	Specifies the tooltip text for the toolbar or toolbutton you are adding. Note: The <code>-tooltip</code> parameter is applicable only for elements of type <code>toolbar</code> and <code>toolbutton</code>. <i>Data_type</i>: string, optional
<code>-underline <i>integer</i></code>	Specifies the integer index of the character to be underlined in the element label. The index begins with 0 and should have a value less than or equal to the length of the element label. For instance, if you want the second letter of the element label to appear underlined, specify <i>integer</i> as 1. Note: The <code>-underline</code> parameter is NOT applicable for elements of type <code>toolbar</code>, <code>separator</code>, and <code>toolbutton</code>. <i>Data_type</i>: int, optional
<code>-value <i>stringValue</i></code>	Specifies the value to be stored in the associated variable when the specified radio button is selected. Note: The <code>-value</code> parameter is applicable only for elements of type <code>radio</code>. <i>Data_type</i>: string, optional
<code>-variable <i>string</i></code>	When modifying a check box or radio button, specifies the Tcl global variable for the item. <i>Data_type</i>: string, optional
<code>-visible {true false}</code>	Specifies the visibility status of the element being modified. <i>Data_type</i>: bool, optional
<code>-visible_variable <i>string</i></code>	Sets the Tcl global variable for Visible status. <i>Data_type</i>: string, optional

Accepted Properties for Each Type

The accepted properties for each type are listed below.

- For the main window (`main`), the following properties can be set:

```
-geometry {widthxheight | widthxheight+x+y}
-title title
-close_command string
-visible true | false
```

- For a status bar (`statusbar`), the following property can be set:

```
-enable_variable string
```

`-in parentname`
`-message msg`
`-visible true | false`
`-visible_variable string`

- For elements of type `menu` or `submenu`, the following properties can be set:

`-enable_variable string`
`-before nextSiblingName]`
`-disabled true | false`
`-in parentName`
`-label label`
`-menu_separate true | false`
`-underline index`
`-visible true | false`
`-visible_variable string`

- For elements of type `command`, `radio`, and `check`, the following properties can be set:

`-disabled true | false`
`-label label`
`-underline index`
`-command commandName`
`-in parentName`
`-before nextSiblingName`
`-enable_variable string`
`-visible true | false`
`-visible_variable string`
`-shortcut string`

For `radio` and `check`, the `-checked` and `-variable` properties can also be set.

- For elements of type `toolbutton`, the following properties can be set:

`-state normal | disabled`
`-label label`
`-tooltip toolTipText`
`-underline index`
`-foreground colorName`
`-icon iconName`
`-command commandName`
`-in parentName`
`-before nextSiblingName`

```
-enable_variable string  
-visible true | false  
-visible_variable string  
-shortcut string
```

Examples

- The following command makes the *View* menu in the main window non-detachable:

```
gui_set_ui view -menu_separate false
```

- The following command sets the color of the main window's title bar to blue:

```
gui_set_ui main -titlebar_color blue
```

gui_set_visible_bumps

gui_set_visible_bumps

[-help]

{-bump_cells *bump_cell_name* / -exclude_bump_cells *string* / -all}

Displays only the bumps with the specified bump cell names and hides all other bumps. Alternatively, you can use the command to display all bumps except the ones specified with `-exclude_bump_cells`.

To redisplay all bumps, specify the `-all` parameter.

Parameters

-help	Prints a brief description that includes type and default information for each <code>gui_set_visible_bumps</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man gui_set_visible_bumps</pre>
-all	Displays all bumps.  By default, all bumps are displayed. When you specify <code>gui_set_visible_bumps bump_cell_name</code>, the tool displays only the bumps with the specified bump cell names and hides all other bumps. You can then use <code>gui_set_visible_bumps -all</code> to redisplay all bumps.
-bump_cells <i>names</i>	Displays only the bumps with the specified bump cell names and hides all other bumps. You can specify multiple bump cell names.
-exclude_bump_cells <i>string</i>	Displays all bumps except the ones specified with <code>-exclude_bump_cells</code>. The specified bumps are hidden. <i>Data_type</i>: string, optional

Examples

- The following command displays only the bumps with bump cell as BUMPCELL:

```
gui_set_visible_bumps -bump_cells BUMPCELL
```
- The following command hides the bumps with bump cell as BUMPCELL but displays all other bumps:

```
gui_set_visible_bumps -exclude_bump_cells BUMPCELL
```

- The following command redisplay all bumps:

```
gui_set_visible_bumps -all
```

Related Information

- [gui_get_visible_bumps](#)

gui_set_visible_net_groups

```
gui_set_visible_net_groups  
[-help]  
{net_group_names | -all}
```

Displays only the specified net groups and hides all other net groups.

To display all net groups, specify the `-all` parameter.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>gui_set_visible_net_groups</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man gui_set_visible_net_groups</code>
<code>-all</code>	Displays all the net groups.
<code>net_group_names</code>	Displays only the specified net groups and hides all other net groups. You can specify multiple net group names.

Examples

- The following command hides all net groups except the specified one:
`gui_set_visible_net_groups test_ng`

Related Information

- [gui_get_visible_net_groups](#)

gui_set_visible_nets

```
gui_set_visible_nets  
[-help]  
{nets | -all}
```

Displays only the specified nets and hides all other nets. To display all nets, specify the `-all` parameter.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>gui_set_visible_nets</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man gui_set_visible_nets</code>
<code>-all</code>	Displays all nets.
<code>nets</code>	Displays only the specified nets and hides all other nets. You can specify multiple net names.

Examples

- The following command hides all nets except the specified net:

```
gui_set_visible_nets ram1/subram02_lower/TESTACT_INST_PERIWDSRAM001PAA512W27C3/tpo_a_9_
```

Related Commands

- `gui_get_visible_nets`

gui_show_edge_number

```
gui_show_edge_number [-help]
[-objects string]
[-reset]
```

Displays edge numbers on the sides of the selected or specified objects in the GUI. Currently, you can display edge numbers on partitions and blocks. This feature is useful if you need to indicate the partition or block edge number in your script.

Parameters

-help	Prints a brief description that includes type and default information for each <code>gui_show_edge_number</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man gui_show_edge_number</pre>
-objects <i>string</i>	Specifies the name of the object for which the edge numbers should be displayed. If you want to specify multiple object names, enclose them in braces or double quotation marks. Currently, you can display the edge numbers for partitions and blocks.
-reset	Clears the edge numbers from the specified or selected objects on the GUI. If you want to clear the edge numbers for all objects, use the <code>-reset</code> parameter with <code>-objects *</code>.

Examples

- The following command displays the edge numbers on the `DTMF_INST/PLLCLK_INST` block in the GUI:

```
gui_show_edge_number -objects DTMF_INST/PLLCLK_INST
```

- The following command clears the edge numbers from all blocks:

```
gui_show_edge_number -objects * -reset
```

Related Information

- [gui_select](#)

gui_show_user_bundle_nets

```
gui_show_user_bundle_nets
[-help]
[-keep_existing]
-net_bundle bundleName
[-remove]
```

Displays flightlines for the specified net bundle. Bundled nets help you with data flow analysis before and after layout. Net bundles can be created and viewed in floorplan and amoeba views. When you run the `gui_show_user_bundle_nets` command, the software switches automatically to the net bundle mode and clears flightlines based on selection.

You can create flight line net bundles using the `gui_create_user_bundle_net` command and delete them using the `gui_delete_user_bundle_net` command.

Note: When selecting objects, you can choose to display flightlines for only bundled nets by using the *Only Show Net Bundle Flight Line* option in the Preferences form. If this option is not selected, the net bundle flightlines are displayed along with other flightlines.

Parameters

-help	Prints a brief description that includes type and default information for each <code>gui_show_user_bundle_nets</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man gui_show_user_bundle_nets</pre>
-keep_existing	Retains existing net bundle flightlines while displaying the flightline of specified net bundles. If this option is not specified, the command clears existing flightlines before displaying specified net bundle flightlines.
-net_bundle <i>bundleName</i>	Specifies the name of the net bundle whose flightlines you want to display. You can specify more than one net bundle.
-remove	Clears flightlines of specified net bundle from the display area. If no net bundle name is specified, all flightlines based on net bundles are removed. Note: This option only clears the flightlines of the net bundle from the display area. If you want to remove the net bundle itself, use the <code>gui_delete_user_bundle_net</code> command.

Examples

- The following command displays flightlines of the net bundle `bundle_1`. Here, `bundle_1` contains `net_1`, which is just between A and B, and `net_2`, which is just between B and C:

```
gui_show_user_bundle_nets -net_bundle bundle_1
```

- The following command displays flightlines of the net bundle `bundle_2` while retaining flightlines of `bundle_1`. Here, `bundle_2` contains `net_3`, which is among B, C, and D:

```
gui_show_user_bundle_nets -net_bundle bundle_2 -keep_existing
```

Note: The same flightlines could also be displayed in a single step by using the following command:

```
gui_show_user_bundle_nets -net_bundle {bundle_1 bundle_2}
```

gui_view_box

`gui_view_box [-help]`

Reports the coordinates of the current area being viewed in the GUI.

Parameters

<code>- help</code>	Prints out the command usage. For a detailed description of the command, use the <code>man</code> command: <code>man gui_view_box</code>
-------------------------	---

Example

The following command reports the coordinates of the current area being viewed in the GUI:

```
tempus 9> gui_view_box
```

```
93.367 -646.465 103.294 -638.724
```

Related Information

- [gui_zoom](#)

gui_write_picture

```
gui_write_picture
[-help]
filename
[-format {bmp gif jpg jpeg png pbm pgm ppm xbm xpm}]
[-honor_umask]
[-width integer_value -height integer_value]
[-window string]
```

Saves a snapshot of the layout or specified window with the specified name in the current directory. You can specify the size as well as the format in which you want to save the snapshot. The command also prints out overlay maps with legends.

You can use this command at any stage of the design flow.

Parameters

-help	Prints a brief description that includes type and default information for each <code>gui_write_picture</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man gui_write_picture</pre>
filename	Specifies the name of the picture file as a string. You can specify the file extension as well. Note: The file extension you specify does not control the format of the picture. The picture file is dumped in the PNG format by default or the format you explicitly specify with <code>-format</code>. For example, the following command saves the <code>testShot</code> picture file in the PNG format: <pre>> gui_write_picture testShot.gif current_directory@file testShot.gif testShot.gif: PNG image data, 540 x 688, 8-bit/color RGB, non-interlaced</pre> Data_type: string, required
-format {bmp gif jpg jpeg png pbm pgm ppm xbm xpm}	
	Specifies the format of the picture file. Default: png Data_type: enum, optional
-height integer_value	

	Specifies the height of the picture as an integral value. Note: The <code>-width</code> parameter is required when <code>-height</code> is specified. <i>Min:</i> 100 <i>Max:</i> 20000 <i>Data_type:</i> int, optional
<code>-honor_umask</code>	Honors the umask settings while saving the picture. If you specify this option, the permission of the saved picture file will be set by subtracting the umask value from the full permission value. For example, if the full permission setting of a file is <code>0666</code> and the umask setting is <code>0022</code>, the tool saves the picture file with the permission setting of <code>0666 - 0022</code>, that is <code>0644</code>. <i>Data_type:</i> bool, optional
<code>-width integer_value</code>	
	Specifies the width of the picture as an integral value. Note: The <code>-height</code> parameter is required when <code>-width</code> is specified. <i>Min:</i> 100 <i>Max:</i> 20000 <i>Data_type:</i> int, optional
<code>-window string</code>	Specifies the ID of the window that you want to dump. You can use the following IDs: - For Layout Viewer: <code>designview.win</code> - For Cell Viewer: <code>.uiCellView.win</code> If <code>-window</code> is not specified, the main layout window is dumped out by default. <i>Data_type:</i> string, optional

Examples

- The following command captures the layout window and saves it in the default PNG format with the name `test2` and the dimensions 1000 x 1000 in the current directory:
`gui_write_picture test2 -width 1000 height 1000`
- The following command captures the layout window and saves it in the GIF format with the

name `test1.gif` in the current directory:

```
gui_write_picture -format gif test1.gif
```

- The following command captures the layout viewer window and saves it in PNG format with the name `testShot.png` in the current directory:

```
gui_write_picture testShot.png -window designview.win
```

Note: You must have the layout viewer open.

- The following command captures the view in the cell viewer window and saves it in PNG format with the name `testCell.png` in the current directory:

```
gui_write_picture testCell.png -window .uiCellView.win
```

Related Information

- [write_to_gif](#)

gui_zoom

```
gui_zoom  
[-help]  
[-to {x y}[-to_radius value]]  
[-selected [-margin integer_value]]  
{-in | -out | -selected | -to {x y} | -rect {x1 y1 x2 y2}}
```

Zooms into or out of the viewable window as per the specified parameters.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>gui_zoom</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man gui_zoom</code>.
<code>-in</code>	Zooms into the viewable window by two times.
<code>-margin</code> <code>integer_value</code>	Specifies the zoom margin ratio for the viewable window. The zoom margin is the minimum spacing between the bounding box of the selected object(s) and the layout view.  The minimum value is 0 and the maximum value is 99. The <code>gui_zoom -selected</code> parameter must be specified if you are specifying <code>-margin</code>. <i>Default: 50</i>
<code>-out</code>	Zooms out from the viewable window by two times.
<code>-rect {x1 y1</code> <code>x2 y2}</code>	Zooms in the viewable window to show all of the rectangular area that is defined by the specified coordinates.
<code>-selected</code>	Zooms in the viewable window to the area that encloses the selected objects.
<code>-to {x y}</code>	Zooms in the viewable window to the point defined by the coordinates, <code>x</code> and <code>y</code> .
<code>-to_radius</code> <code>value</code>	Zooms in the viewable window to a radius of the specified value in microns, with center at the point specified by <code>-to {x y}</code>. <code>value</code> is of type float. <i>Default: 150 microns</i> Note: The <code>-to {x y}</code> parameter must be specified with this parameter.

Examples

- The following command zooms in the viewable window to the area enclosed by the lower-left coordinates (450 531) and the upper-right coordinates (550 631):

```
gui_zoom -rect {450 531 550 631}
```

- When the following command is run, the display zooms in to point with x=100 and y=200. The display area is centered at this point and has the default radius of 150 microns:

```
gui_zoom -to {100 200}
```

- When the following command is run, the display zooms in to point with x=100 and y=200. The display area is centered at this point and has a radius of 50 microns:

```
gui_zoom -to {100 200} -to_radius 50
```

Loading power/rail analysis results into GUI.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>read_power_rail_results</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man read_power_rail_results</code> .
-cell_library { library1.cl}	

	Specifies the single cell library that is required to load the state directory. The specified cell library must contain the technology layer information that is required to load the state directory. Therefore, you do not need to load all cell libraries used during analysis.
<code>-custom_value_inst_file_1 file</code>	
	Specifies the name of the custom value instance file (CVIF). This file can be used to display a user-specified instance voltage file in GUI. The format of the CVIF file is: <pre>value1 instancename1 value2 instancename2</pre> where, <i>value1</i> and <i>value2</i> are voltage values mapping to the specified instance. You can use the <code>cvil</code> argument of the <code>gui_set_power_rail_display -plot</code> command parameter to view the EIV map in GUI.
<code>-data_type {rail all}</code>	
	Controls the type of data to be loaded in the GUI. The possible arguments of this parameter are: • <code>rail</code> - Loads only the rail analysis results. • <code>all</code> - Loads both the power and rail analysis results. This is the default value.
<code>-detail_delta_temperature_file file</code>	
	Specifies the name of the detailed wire-based delta temperature file from self-heating analysis.
<code>-die_instance_name dieinstname</code>	
	Specifies the name of the die whose results you need to view. This parameter is only applicable to the multi-die analysis flow (<code>set_rail_analysis_config -die_mode multi-die</code>). The <code>-die_instance_name</code> parameter must be specified with the <code>-rail_directory</code> parameter (multi-die rail directory).
<code>-effective_resistance_file file</code>	

	Specifies the result file from effective resistance analysis (only instance-based result is supported). When the rail analysis plot type <code>effr</code> is selected and a result file is specified, the layout shows effective resistance analysis result for each instance. Note: Currently, this feature only supports loading one net at a time.
<code>-enable_plots plot_names</code>	
	Specifies the list of power or rail plots names that are to be loaded.
<code>-esd_directory dir</code>	
	Specifies the ESD analysis directory.
<code>-esd_em dir</code>	
	Specifies the name of the directory where the current density/EM results generated by a previous ESD analysis run reside. This parameter allows you to selectively load the required EM result directory if there are multiple ESD EM result directories under the <code>ESD</code> directory. You must either load the rail directory (<code>-rail_directory</code>) before running this command, or specify the rail directory with the <code>-esd_em</code> parameter.
<code>-force</code>	
	Specifies to block the pop-up window that appears when the <code>read_power_rail_results -reset</code> parameter is specified. The pop-up window displays a confirmation message for resetting the power and rail directories. Example: <pre>read_power_rail_results -reset -force</pre>
<code>-instances instancenames</code>	

	Specifies a list of instances to load in the GUI. This parameter loads only those partitions that include the specified instances. The <code>-instances</code> parameter allows you to analyze parts of the designs, thereby reducing the loading time and memory footprint. The <code>-instances</code> parameter is applicable to the Voltus-XP flow only.
<code>-instance_delta_temperature_file file</code>	
	Specifies the name of the instance-based delta temperature file from self-heating analysis. This is the device instance temperature.
<code>-instance_voltage_method { best worst avg worstavg }</code>	
	Loads the instance voltage data for the specified EIV computing method. If this parameter is not specified (default), the instance voltage results for all the four methods are loaded.
<code>-instance_voltage_window { timing whole }</code>	
	Loads the instance voltage data for the selected EIV window. If this parameter is not specified (default), the instance voltage results for both the timing and switching windows, and the entire rail simulation are loaded.
<code>-nets net_names</code>	
	Loads only the specified nets in the domain-based state directory to the GUI. If this parameter is not specified with the <code>-rail_directory</code> parameter, all the nets will be loaded.
<code>-power_db file</code>	
	Specifies the power database file. This file was created by using the <code>power_write_db</code> attribute.
<code>-power_directory power_output_directory</code>	
	Specifies to load the power analysis results and display the power plots directly without loading the rail analysis results.
<code>-profiling_power_file file</code>	
	Specifies to display the tile-based power density results generated from the vector profiling flow.

<code>-physical_db dir_name</code>	Specifies the name of the hierarchical design directory to be loaded to the GUI along with the rail analysis results.
<code>-reset</code>	
	Frees the loaded analysis state directory or power database from the memory.
<code>-rail_directory dir</code>	
	Specifies the rail analysis directory. You can load all the domain results by selecting the automatically generated analysis directory under the output directory (<code><domain>_<temp>_<dynamic/avg>_#</code>), or load individual nets by going one level further and selecting the net directory.
<code>-short_file file</code>	
	Specifies the path to the short violations report (<code>voltus_short.report</code>) . This file is generated using the <code>set_rail_analysis_config -report_shorts true</code> command parameter, and is located in the work directory.
<code>-signal_em_db file</code>	
	Specifies to read the signal electromigration data from the specified database file generated by the <code>check_ac_limits -report_db</code> command parameter.
<code>-thermal_file filename.txt</code>	
	Specifies to load the tile-based temperature map file generated by Sigrity PowerDC to be used for both power calculation and IR drop analysis. The following is an example of reading the thermal map file: <pre>read_power_rail_results -rail_directory output/static_rail/core_25C_avg_1/ -thermal_file output/power_map_by_layer.txt gui_set_power_rail_display -plot thermal</pre>
<code>-tile_delta_temperature_file file</code>	
	Specifies the name of the tile-based delta temperature file of self-heating analysis. This is the worst instance temperature among all wire segments in a tile. This is also layer-based. The FEOL or cell layer is used to show the device instance temperature.

<code>-tile_thermal_config_file filename</code>	
	Specifies to load the configuration file that contains the mapping between the hierarchical levels with corresponding layer-based temperature map files generated by Celsius (system-level thermal analysis tool). When specified, you can view tile-based temperature distribution for each layer of the chip. The following is the format and example of the hierarchical configuration file: <pre><hierarchy> <block name> <X_tile_no,Y_tile_no> <LEF/DEF Flip/Rotation> <temperature map> TOP DIE 0,0 N /thermal_data/DIE_TemperatureMap TOP/IP1 IP1 25,50 N /thermal_data/IP1_TemperatureMap TOP/IP1/B1 B1 50,125 N /thermal_data/B1_TemperatureMap TOP/IP1/B2 B2 200,125 S /thermal_data/B2_TemperatureMap</pre> This is a mandatory parameter for the <code>tile_thermal</code> plot when loading hierarchical temperature maps.
<code>-top_cell_name topcell_name</code>	
	Specifies the name of the top module or top cell name to be loaded. This parameter must be specified with the <code>-physical_db</code> parameter.

Examples

- The following command specifies the appropriate files needed for viewing the instance voltage and power data:

```
read_power_rail_results\  
-rail_directory analysis/domain_25C_avg_1 \  
-power_db powermeter.db \
```

- The following command specifies to load only the rail directory:

```
read_power_rail_results -rail_directory dynamic_rail/core_25C_dynamic_1 -data_type rail
```

- The following command specifies to display the tile-based power density results in the GUI:

```
read_power_rail_results -profiling_power_file ./vectorProfileResults/profile.rpt.density
```

- The following command specifies to load the power analysis results and display the power plots directly by running the power analysis without loading the rail analysis results:

```
read_power_rail_results -power_directory ./dynamic_power
```

Related Topics

- "[Static Power, IRdrop and EM Analysis](#)" in the *Voltus User Guide*

report_power_rail_results

```
report_power_rail_results
[-help]
[-append]
[-enable_filter_summary]
[-file_name file ]
[-filter_max max_value]
[-filter_min min_value]
[-ignore_limit_bound]
[-layers {All, layer_names } ]
[-limit N ]
[-nets {all | all_pwr | all_gnd | net_names}]
[-plot plot_type]
[-range_max max_value]
[-range_min min_value]
[-region x1 y1 x2 y2]
[-rlrp_inst {instance_name}]
```

Generates RLRP, region-based, and rail/power/capacitance reports.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>report_power_rail_results</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man report_power_rail_results</code> .
-append	Appends instance reports to the current report file.
-enable_filter_summary	
	Displays a summary of the filtered data in the histogram given in the <i>Summary</i> tab of the Result Browser form.
-file_name file	

	Specifies the name of the text based violation report file to be created. The default file name is: • for region-based report: <code>region_x1_y1_x2_y2.rpt</code> • for RLRP report: <code>rlrp_instname.rpt</code> • for plot-based report: <code>power_rail_plot.rpt</code>
<code>-filter_max max_value</code>	
	Specifies the maximum value to include in the report. Use this option to further filter out the data within the range specified. This is used to obtain statistic of filter range. Optional, but if specified, the <code>-plot</code> option is required, and requires both <code>-filter_min</code> and <code>-filter_max</code> to be specified.
<code>-filter_min max_value</code>	
	Specifies the minimum value to include in the report. Use this option to further filter out the data within the range specified. This is used to obtain statistic of filter range. Optional, but if specified, the <code>-plot</code> option is required, and requires both <code>-filter_min</code> and <code>-filter_max</code> to be specified.
<code>-ignore_limit_bound</code>	
	Specifies to ignore the maximum upper limit of 10000, and instead use the higher value given with the <code>-limit</code> parameter for specifying the number of data points to be printed in the power/rail report.
<code>-layers {all, layer_names }</code>	
	Specifies the layers to be reported. You can use <code>all</code> for reporting all layers, or list the specific layers that are to be reported. If this parameter is specified, you must specify the <code>-plot</code> parameter.
<code>-limit N</code>	
	Specifies the number of data points printed in the report. If this parameter is specified, you must specify the <code>-plot</code> parameter. Default : first 1000 data points
<code>-nets {all all_pwr all_gnd net_names}</code>	

	Specifies the nets to be used for analysis reporting. You can use <code>all</code> for reporting all nets, <code>all_pwr</code> for reporting all power nets, <code>all_gnd</code> for reporting all ground nets, or list the specific nets that are to be reported. If this parameter is specified, you must specify the <code>-plot</code> parameter. This parameter also allows you to specify the switched and always-on nets to be used for analysis reporting. The following is the use model to generate a report for the specified switched net: <pre>report_power_rail_results -plot ir -nets {switchedNetName}</pre> The following is the use model to generate a report for the specified always-on net, including its switched nets: <pre>report_power_rail_results -plot ir -nets {alwaysOnNetName} -all</pre> You must specify <code>-all</code> to include all switched nets associated with the specified always-on net.
<code>-plot plot_type</code>	
	Plots the specified plot type. See Plot Types for a description of each of the plot types.
<code>-range_max max_value</code>	
	Specifies the maximum value to report. Optional, but if specified, the <code>-plot</code> option is required, and requires both <code>-range_min</code> and <code>-range_max</code> to be specified.
<code>-range_min min_value</code>	
	Specifies the minimum value to report. Optional, but if specified, the <code>-plot</code> option is required, and requires both <code>-range_min</code> and <code>-range_max</code> to be specified.
<code>-region x1 y1 x2 y2</code>	
	Measures tap current and capacitance information in the specified region defined by x1, y1, and x2 y2 coordinates, and prints results in the log file.
<code>-rlrp_inst instance_name</code>	
	Reports the RLRP path for the specified instance. The default file name of the RLRP path report is <code><rlrp_instname.rpt></code>. You can modify the file name using the <code>-file_name</code> parameter.

Plot Types

Plot Type	Description
ac	Available/feasible capacitance (Farad) Displays the feasible decoupling capacitance that can be added in the area. The feasible capacitance in the area is calculated based on the filler cells placement. The program matches the placed filler cells with the decap cells available in the power-grid library and computes the feasible capacitance. The capacitance of the decap cell is stored in the power-grid library.
cap	Ggrid capacitance (Farad) Plots the capacitance of the extracted power-grid network.
dd	Decoupling capacitance (decap) density (Farad/μm^2) Plots decap density of the design. The decap density is the cell internal decoupling capacitance in the unit area (μm^2).
dr	Decoupling capacitance required Reports the decoupling capacitance required to fix dynamic IR-drop violations. This option suggests how much decap needs to be added in a given area to fix the IR-drop violations.
ivdn	Instance Voltage Drop (Volts) – net-based Plots the net-based instance voltage drop.
ivdd	Instance Voltage Drop (Volts) – domain-based Plots the domain-based instance voltage drop. For domain based, at least one power and one ground net must be selected.
fd	Filler cell density ($1/\mu\text{m}^2$) Displays the filler cell density per unit area (μm^2). The plot can be used to analyze the feasibility of adding decap cells by replacing the filler cells and not changing the placement of the logic cells.

freq	Frequency domain (Hz) Displays the associated clock frequency of all instances in the design. The instances associated with multiple clock domains are displayed using the fastest clock frequency. This plot can be used to analyze and debug the power distribution in the design.
ip	Instance total power (mW) The total power consumed by each instance is displayed. The total power is the sum of the internal, switching and leakage power of the instance. The power data is read from the power database and can be specified using the <code>-power_db</code> option or it is queried directly from memory, if power calculation is run during the session.
ip_i	Instance internal power (mW) The power consumed by charging and discharging of the internal interconnect and device capacitances of the instance.
ip_l	Instance leakage power (mW) The power consumed by devices when not switching.
ip_s	Instance switching power (mW) The power consumed by charging and discharging of the interconnect or output load.
ipd_i	Specifies internal power density in $\text{mW}/\mu\text{m}^2$.
ipd_l	Specifies leakage power density in $\text{mW}/\mu\text{m}^2$.
ipd_s	Specifies switching power density in $\text{mW}/\mu\text{m}^2$.
ipd_t	Specifies total power density in $\text{mW}/\mu\text{m}^2$.
ir	IRdrop or voltage drop (Volts) Displays the IRdrop across each extracted power-grid segment in the design.
jrms	Specifies current density as j/j_{max} based on the I_{rms} current. This plot is only supported for dynamic analysis. A <code>jrms</code> gif file will be saved in the state directory that shows where the I_{rms} based EM violation occurred. This plot type allows you to verify the analysis results of "jrms" using the GUI.

load	Loading capacitance (Farad) Displays the output loading capacitance driven by the instance. This plot can be used to analyze and debug the regions with high switching power.
pi	Power-switch (gate) current violation: I/I_{dsat} Displays the ratio of current through the power-switch and the saturation current (I_{dsat}) of the power-switch. This plot can be used to analyze and debug whether the current through power-switches exceeds the saturation current characterized for the power-switch devices. The saturation current and on-resistance of the power-switches are characterized and stored inside the power-grid library of the power-switch cell. A ratio of greater than 1 means that the current requirement of the power-gated block can not be met with placed power-switch instance. Either the power-switch needs to be made larger or power-switch instances need to be added.
pv	Voltage drop across power-switch (Volt) Displays the IRdrop across power-switch instances. This plot can be used to analyze and debug the IRdrop inside the power-gated block, e.g. if the IRdrop across power-switches is already high, the IRdrop inside the power-gated block will be much higher. In this case, the power-switch placement will have to be refined in order to resolve the IRdrop problem.
rc	Resistor current (Amp) Displays the current across power-grid resistor segments. This plot can be used to analyze and debug how the current flows from the voltage sources into the rest of the design, e.g. high current should flow from pads to the top-level routing level layers and then to the lower level metal layers. This plot can also be used to debug current density violations (r_j).

rlrp	The total resistance of the instance along the least resistive path. Displays the total resistance of the instance along the least resistive path, meaning the resistance of the instance along the path from where it gets the most amount of current. This plot can be used to analyze and debug the power-grid integrity early in the design stage. An instance with high resistance is likely to have high static or dynamic IRdrop depending on the vector that is simulated later in the design cycle. This plot can be also used during decap optimization, since regions with high dynamic IRdrop and high resistance may not be improved upon by adding decaps, because the effectiveness of decoupling capacitance depends on the resistance of the power-grid network. You can also highlight the least resistive path of the instance using the GUI and selecting the instance with left mouse button. The <i>RLRP Path</i> checkbox should be enabled.
res	Displays the total resistance of the least resistive path from each node to voltage source. This plot can be used to view high resistance regions of the power-grid. It is useful during IRdrop and decap analysis to identify weak power-grid connectivity.
rj	Resistor current density, J/Jmax. Displays the current density (current per unit area) violation on each power-grid segment using the ratio of calculated current density and maximum allowed current density. A ratio of greater than 1 means that the current density limit of the segment is violated. The current density limits are supplied by the foundry and can be read during analysis using the <code>set_rail_analysis_config -em_models</code> command.
rs	Specifies the plot type for resistor sensitivity.
slack	Instance slack (Seconds) Displays worst instance slack. The slack data is queried from either the timing database or if the power database is specified using <code>-power_db</code> option, then the worst slack data is read from the power database. When using an external TWF, the slack data is read from the TWF.
tc	Tap current (Amp) Displays the current consumed by the instance devices or current taps. During rail analysis, it is based on the power consumption of the instance and is distributed inside the cell. The current distribution inside the cell is based on the extracted device netlist stored inside the power-grid library of the cell. The current distribution is generally based on the device width, length, and spice models. This plot can be used to analyze and debug IRdrop inside the macro.

td	Transition density (Hz) Displays the worst transition density (activity * frequency) of the instance. This plot can be used to analyze and debug activity distribution and high power density regions.
unc	Unconnected segments Displays power-grid segments that are disconnected from the voltage source (power pads). This plot can be used to debug unusually high IRdrop in the region.
vc	Voltage source current (Amp) Displays current through the voltage sources (power pads). This plot can be used to analyze the current carrying capacity of the power-pad.
vu	Voltage drop across package (Volt) Displays voltage drop across package. If analysis is run with package model attached to the power pads, this plot displays the IRdrop due to package RLCK elements.

Examples

- The following command will report the worst 100 IR segments on Metal 1 of the VDD net:
`report_power_rail_results -plot ir -layers M1 -limit 100 -nets VDD`
- The following command will report the IR drop of the VDD_ring switched net:
`report_power_rail_results -plot ir -net {VDD_ring}`
- The following command will report the IR drop of the VDD_AO always-on net, including its switched nets:
`report_power_rail_results -plot ir -net {VDD_AO} -all`

Related Topics

- ["Static Power, IRdrop and EM Analysis"](#) in the *Voltus User Guide*

view_last

`view_last [-help]`

Displays the last view window or the previous view. This command provides the same function as the Zoom Previous icon (bindkey *w*).

Parameters

<code>-help</code>	Prints a brief description of the <code>view_last</code> command. For a detailed description of the command, use the <code>man</code> command: <code>man view_last</code> .
--------------------	--

Related Information

- `gui_zoom`
- `view_next`

view_next

`view_next [-help]`

Displays the next view window. This command provides the same function as the *Next* toolbar widget. You can use the `view_next` command or the *Next* toolbar widget to switch from the current display to the next location in the *Go To Saved Area* list or the next zoom level in the zoom sequence saved in the design memory. The equivalent bindkey is `Y`. When you press the `Y` bindkey or execute the `view_next` command repeatedly, the tool cycles through all saved views (saved areas and zoom levels).

Parameters

<code>-help</code>	Prints a brief description of the <code>view_next</code> command. For a detailed description of the command, use the <code>man</code> command: <code>man view_next</code> .
--------------------	--

Related Topics

- `gui_zoom`
- `view_last`

write_to_gif

```
write_to_gif
[-help]
out_file
[-honor_umask]
```

Saves a snapshot of the current screen to a GIF file with the specified name in the current directory. You can use this command at any stage of the design flow.

Parameters

-help	Prints a brief description that includes type and default information for each <code>write_to_gif</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man write_to_gif</code>.
out_file	Specifies the name of the output file as a string.
-honor_umask	Honors the umask settings while saving the GIF file. If you specify this option, the permission of the saved GIF file will be set by subtracting the umask value from the full permission value. For example, if the full permission of file is <code>0666</code> and the umask setting is <code>0022</code>, the tool saves the GIF file with the permission setting of <code>0666 - 0022</code>, that is <code>0644</code>. <i>Data_type</i>: bool, optional

Example

The following example captures the current screen and saves it to `test1.gif` in the current directory.

```
write_to_gif test1.gif
```

```

Commits module models.

Note: The ILM is not supported for Signoff in Tempus.

Parameters

<code>-1801 filename</code>	Specifies IEEE 1801 file.
<code>-copy_mmmc_latencies</code>	Copies clock latencies of all the analysis views at the top-level design and applies them after assembling the design: When this option is specified, the command will do following after assembling the design: <pre>update_analysis_view -name \$view -latency_file \$latency_map(\$view)</pre> Where <code>latency_map</code> has clock latency files for all the views.
<code>-cpf_file filename</code>	Specifies the name of the full chip CPF file to be used.
<code>-help</code>	Outputs a brief description that includes the type and default information for each <code>commit_module_model</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <pre>man commit_module_model</pre>
<code>-merged_mmmc_map_file mapFiles</code>	Specifies merge hierarchical mmmc map files.
<code>-merged_mmmc_sdc_files mergedSdcFiles</code>	Specifies SDC files for different dies.
<code>-mmmc_file fullChipSdc</code>	Specifies the name of the full chip MMMC view file.
<code>-mmmc_module_model_tag modelTag</code>	Specifies MMMC module model tag.
<code>-propagate_clocks</code>	Changes clock ideal to propagated clock. When this option is specified, you can run the following commands: <pre>set_interactive_constraint_modes [all_constraint_modes -active]</pre> <pre>set_propagated_clock [all_clocks]</pre>

create_active_logic_view

create_active_logic_view

[help]

[-type {flat_top timing_budget} [-set_dont_touch | -unset_dont_touch]]

Trims the timing graph to ignore logic inside the first level registers in partitions to improve runtime for timing-related commands.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>create_active_logic_view</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man create_active_logic_view</code>.
-set_dont_touch	Sets the <code>dontTouch</code> value as <code>true</code>. This freezes I/O interfaces (Interface logics and interface nets) and prevents the <code>opt_design -post_cts -hold</code> from optimizing the block interface logics. The ILM ECO data can be loaded back.
-type {flat_top timing_budget}	<code>flat_top</code>: Used to mark the top-level timing graph to mask all logic inside the interface logic of each partition. <code>timing_budget</code>: Instructs the command to use the same settings as <code>create_timing_budget</code> when marking the top-level timing graph. This option should be specified if you plan to run <code>time_design</code> or <code>opt_virtual</code> with ART based and later on run <code>create_timing_budget</code> based on the resulted timing graph.
-unset_dont_touch	Sets <code>dontTouch</code> value as <code>false</code>. This resets the <code>dontTouch</code> on I/O logics before reading the ECO data.

create_ilm_from_files

```
create_ilm_from_files
[-help]
[-cell block_name]
[-incremental]
-model_type {timing | cts | si}
[-overwrite]
[-si_timing_window_file xtwf_file.spef]
{-out_dir directory_name | -oa_cellview lib cell view}
[-verilog_file cell_name.v [-cell_prefix cell_prefix -uniquify_netlist]]
[-sdc_file file_name -timing_view view_name]
[-spef_file spef_file.spef -rc_corner RC_corner_name]
[-opt_stage stage]
```

Creates an ILM directory from existing data. It can only create non-merged models. This command is useful in situations where an ILM is to be created through external inputs or using data from third party models into a format that could be recognized by Tempus.

If the data files already exist in the specified directory, the tool stops and generates an error message. You can overwrite existing files by specifying `-overwrite`. You can add files to the directory by specifying `-incremental`.

The command also creates a tcl script (`cell_name_ILM.tcl`) that you can source in your command file. The script contains the following command:

```
read_ilm -cell cell_name -out_dir dir_name
```

Note: The ILM is not supported for Signoff in Tempus.

Parameters

<code>-cell <i>block_name</i></code>	Specifies the name of the block.
<code>-cell_prefix <i>cell_prefix</i></code>	Specifies the cell prefix.
<code>-oa_cellview <i>lib cell view</i></code>	Specifies the library name, cell name, and view name in the OpenAccess database format.
<code>-opt_stage <i>stage</i></code>	Specifies the optimization stage, preCTS or postCTS.
<code>-out_dir <i>dir_name</i></code>	Stores the ILM data in the specified directory: the absolute directory path or the path relative to the current directory.
<code>-incremental</code>	Lets you add files in addition to the existing files to the directory.

<code>-model_type {timing cts si}</code>	Specifies the type of ILM model, i.e timing, cts or si,.
<code>-help</code>	Outputs a brief description that includes the type and default information for each <code>create_ilm_from_files</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man create_ilm_from_files.</code>
<code>-overwrite</code>	Overwrites existing files in the directory.
<code>-rc_corner RC_corner_name</code>	Specifies the RC corner name for MMMC analysis. It identifies the specified corner to be used with <code>-spef_file</code> .
<code>-sdc_file file_name</code>	Specifies an existing .sdc file that you want to include in the directory. It identifies the sdc file to be used with the specified view.
<code>-spef_file spef_name.spef</code>	Specifies an existing .spef file that you want to include in the directory. It identifies the spef file to be used with the specified corner.
<code>-timing_view view_name</code>	Specifies the view name for the ILM module. It identifies the specified view to be used with <code>-sdc</code> .
<code>-uniquify_netlist</code>	Uniquifies the input Verilog netlist. This ensures that there are no errors when ILMs are being loaded. Using this parameter, each sub-module for an ILM has a unique name, which is composed of the time stamp and its original name. For example, in <code>top_sm</code> <code>WedJun31138212009\$data_path</code>, <code>top_sm</code> specifies the top-level design, <code>WedJun31138212009</code> specifies the time stamp, and <code>\$data_path</code> specifies the original module name. <i>Default:</i> Off
<code>-verilog_file netlist_name.v</code>	Specifies the verilog file you want to include in the ILM data directory.
<code>- si_timing_window_file xtwf_file.spef</code>	Specifies the .xtwf file that you want to include in the directory.

Examples

- The following commands create two module directories:

```
create_ilm_from_files -cell blk1 -out_dir A -model_type timing -verilog_file V1.v -  
spef_file 1.spef -rc_corner corner1 -sdc_file sdcfile1 -timing_view view1
```

```
create_ilm_from_files -cell blk2 -out_dir A -model_type si -verilog_file V2.v -spef_file  
2.spef -rc_corner corner2 -sdc_file sdcfile2 -timing_view view2
```

- The command creates two tcl files in the current directory. The `blk1_ILM.tcl` file contains the following command:

```
read_ilm -out_dir A -cell blk1
```

The `blk2_ILM.tcl` file contains the following command:

```
read_ilm -out_dir A -cell blk2
```

flatten_ilm

```
flatten_ilm  
[-help]
```

Flattens the interface logic models (ILMs) at the top level so that the entire design can be analyzed at the top. When you use this command, the software switches from blackbox view to ILM view.

If you do not run `flatten_ilm`, the ILM netlist will not be visible to the Tempus software. You can switch between the ILM view and the blackbox view using the `flatten_ilm` and `unflatten_ilm` commands.

All super commands flatten the ILMs internally and hence no explicit `flatten_ilm` is required. However, you should use this command for other timing related commands. For example, for the `report_timing` command, you need to run `flatten_ilm` before reporting timing. It would not work in the unflattened mode.

Note: The ILM is not supported for Signoff in Tempus.

Parameters

<code>-help</code>	Outputs a brief description that includes the usage of the <code>flatten_ilm</code> command.
--------------------	--

Example

```
flatten_ilm  
  
report_timing
```

Related Topic

- [report_timing](#)

get_ilm_type

```
get_ilm_type
[-help]
[-model]
```

Displays the ILM model information.

Note: The ILM is not supported for Signoff in Tempus.

Parameters

-help	Outputs a brief description that includes the type and default information for each <code>get_ilm_type</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man get_ilm_type</code>
- model	Specifies the model type.

Example

- The following example displays the current setting for the `-model` parameter:

```
get_ilm_type -model
```

The software displays the following information:

```
timing
```

Related Topic

- [set_ilm_type](#)

ilm Category Attributes

The root attributes in the ilm category are:

- `ilm_auto_use_sdc_files`
- `ilm_filter_internal_path`
- `ilm_keep_async`
- `ilm_keep_flatten`
- `ilm_keep_high_fanout_ports`
- `ilm_keep_inst_in_sdc`
- `ilm_keep_loopback`
- `ilm_max_num_insts`
- `ilm_max_num_registers`
- `ilm_slack_driven`

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `ilm` category, use the following command:

```
get_db -category ilm
```

ilm_auto_use_sdc_files

```
ilm_auto_use_sdc_files {true|false}
```

Default: `false`

Data_type: `bool`, read/write

Reloads the `sdc_files` of top-level design.

Related Command

- `write_ilm`

ilm_filter_internal_path

```
ilm_filter_internal_path {true|false}
```

Default: false

Data_type: bool

When set to true, group paths are created for internal paths with slack adjustment of 9999. Therefore, all internal paths are filtered out from the timing report.

Related Command

- `write_ilm`

ilm_keep_async

```
ilm_keep_async {true|false}
```

Default: false

Data_type: bool

Keeps paths from asynchronous input ports. For example, paths from an input port to the reset pin of interface sequential instances, but not to the internal sequential instances.

ilm_keep_flatten

```
ilm_keep_flatten {true|false}
```

Default: true

Data_type: bool

Makes flow work under the flattenIlm mode.

ilm_keep_high_fanout_ports

```
ilm_keep_high_fanout_ports {true|false}
```

Default: true

Data_type: bool

Keeps high-fanout input port paths.

ilm_keep_inst_in_sdc

`ilm_keep_inst_in_sdc {true|false}`

Default: false

Data_type: bool

Keeps instances which have constraints on it.

ilm_keep_loopback

`ilm_keep_loopback {true|false}`

Default: false

Data_type: bool

Keeps loop back paths.

When set to `true`, then any path touching a net used for the ILM model is also included. This is done for better model accuracy, so that the actual capacitance on an output port could affect the delay on a net which feeds an internal path that is normally not included in the ILM model. This also degrades the reduction ratio ($\#ILM_insts/\#all_inst$) for the block.

ilm_max_num_insts

`ilm_max_num_insts maxInstances`

Default: 1000

Data_type: int, read/write

Specifies the maximum number of instances.

ilm_max_num_registers

`ilm_max_num_registers maxRegisters`

Default: 40

Data_type: int, read/write

Specifies the maximum number of registers.

ilm_slack_driven

`ilm_slack_driven {true|false}`

Default: `false`

Data_type: `bool`, `read/write`

Specifies slack driven ILM generation.

read_ilm

```
read_ilm  
[-help]  
[-no_si]  
[-no_spef]  
[-oa_cellview cell view]
```

Specifies ILM data directory for the specified block. You can run `read_ilm` multiple times in the same session. Each time you specify `read_ilm`, the software overwrites the previous setting for the block. If master/clones exist in the design, the cell name will have the name of the master partition.

Note: You can use this command only if the ILMs are unflattened (`unflattenIlm`) or the design is in black box view. You cannot change ILM settings in flattened or ILM view.

The syntax is order-dependent. You must specify `-cell` before you specify `-directory`.

Note: The ILM is not supported for Signoff in Tempus.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>read_ilm</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man read_ilm</code>
<code>-no_si</code>	Specifies to read the non-SI data from the ilm directory.
<code>-no_spef</code>	Specifies to read the non-Spef data from the ilm directory.
<code>-oa_cellview</code> <i>cell view</i>	Specifies the library name, cell name, and view name in the OpenAccess database format.

Related Topic

- [write_ilm](#)

report_ilm_status

report_ilm_status
[-help]

Reports ILM status information including ILM block names, ILM data locations, and if the design is in the flattened or unflattened state.

You can use this command at any time in the flow, but it only reports ILM information if you have already specified ILMs in the design.

Note: The ILM is not supported for Signoff in Tempus.

Parameters

- help	Outputs a brief description of the report_ilm_status command. For a detailed description of the command, use the man command: man report_ilm_status
--------	--

Examples

The following command generates the ILM status report for dtmf_chip:

```
report_ilm_status

*** ILM status report ***

Current design: dtmf_chip

The following blocks are specified as an ILM block:

    Hierarchical instance(HInst) DTMF_INST/RAM_128x16_TEST_INST (cell: ram_128x16_test)
    Hierarchical instance(HInst) DTMF_INST/RAM_256x16_TEST_INST (cell: ram_256x16_test)
    Hierarchical instance(HInst) DTMF_INST/TDSP_CORE_INST (cell: tdsp_core)
    Hierarchical instance(HInst) DTMF_INST/RESULTS_CONV_INST (cell: results_conv)

Current view is ILM (after flattenIlm)

Current ILM data is for cts-mode.

ILM blocks data location:

ram_128x16_test   : ../../PTN/ram_128x16_test/ilm
ram_256x16_test   : ../../PTN/ram_256x16_test/ilm
tdsp_core         : ../../PTN/tdsp_core/ilm
```

```
results_conv : ../../PTN/results_conv/ilm  
*** end of ILM status report ***
```

reset_ilm

```
reset_ilm
[-help]
-cell cellName
```

Unspecifies the ILM cell.

This is used to unspecify a previously specified ILM. This would be useful in situations where ILMs are to be removed from the design, to put them in non-ILM or black box mode.

Note: The ILM is not supported for Signoff in Tempus.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>reset_ilm</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man reset_ilm</code>
-cell <i>cellName</i>	The name of the block to unspecify.

Related Topic

- [set_ilm](#)

set_ilm

```
set_ilm  
-cell cellName  
-in_dir dirName
```

Specifies ILM data directory for the specified block. You can run `set_ilm` multiple times in the same session. Each time you specify `set_ilm`, the software overwrites the previous setting for the block. If master/clones exist in the design, the cell name will have the name of the master partition.

Note: The ILM is not supported for Signoff in Tempus.

Parameters

<code>-cell <i>cellName</i></code>	Specifies the block name.
<code>-in_dir <i>dirName</i></code>	Specifies the directory for the files you want to read.

Example

- The following commands specifies directory `dir_dsp_core` for block `tdsp_core`, and directory `dir_onemore` for block `onemore`:

```
set_ilm -cell tdsp_core -in_dir dir_dsp_core  
set_ilm -cell onemore -in_dir dir_onemore
```

Related Topic

- [reset_ilm](#)

set_ilm_type

```
set_ilm_type
[-help]
[-model {timing | si}]
```

Controls the behavior of commands in the presence of ILMs.

ILM models can be an SI model or a non-SI model. In the flow, sometimes an explicit `flatten_ilm` needs to be performed to perform the underlying operation. Based on the nature of operation, an appropriate model could be invoked/switched with the above command.

Use the `get_ilm_type` command to display the current settings for the `set_ilm_type` command.

Note: The ILM is not supported for Signoff in Tempus.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>set_ilm_type</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man set_ilm_type</code>.
-model {timing si}	Specifies the ILM model that is to be used by the <code>flatten_ilm</code> command. All the timing-related commands require data to be in the flattened state (physical command require unflattened state). Design commands such as <code>optDesign</code>, <code>clockDesign</code>, <code>timeDesign</code>, and so on automatically set this parameter before flattening ILMs. However, the CTE commands and some clock commands, which can be run in the flattened mode require manual settings. • Use the <code>si</code> model for flattening the SI ILM model. • Use the <code>timing</code> model for flattening the non-SI related timing commands. Note: In case of non-merged models, use the <code>cts</code> model before running <code>flatten_ilm</code> followed by the command which directly deals with the clocks. <i>Default:</i> <code>timing</code>

Examples

- The following command can be used to get timing reports containing the SI push-out delays on nets using the `-set_ilm_type -model` command:

```
set_ilm_type -model si
```

```
# Flattens to SI model
```

```
flatten_ilm
```

```
# Turns on SI aware delay calculation
```

```
set_db delaycal_enable_si true
```

```
# Adds incremental delay column (for SI push-out delays)
```

```
# in timing output:
```

```
set_global_report_timing_format {instance arc cell fanout load slew delay incr_delay  
arrival}
```

```
# Minimizes the width of the report such that it easily
```

```
# fits into the screen without wrapping
```

```
set_table_style -name report_timing -no_frame -indent 0
```

```
report_timing
```

Note: You can also invoke the Global Timing Debugger (*Timing - Debug Timing - Generate*)

Related Topic

- [get_ilm_type](#)

unflatten_ilm

```
unflatten_ilm  
[-help]
```

Reverts the ILM back to its original hard macro view.

You can use this command after the `flatten_ilm` command.

Note: `unflatten_ilm` will take no effect if the design is already in the unflattened mode.

Many physical commands would not work in the flattened mode. They would need to be unflattened before performing the operation.

For example:

```
flatten_ilm  
  
report_timing  
  
unflatten_ilm
```

Note: The ILM is not supported for Signoff in Tempus.

Parameters

-help	Outputs a brief description that includes the usage of the <code>unflatten_ilm</code> command.
-------	--

Example

The following command flattens all partitions and their ILM designs to the top-level. After reporting timing, the design is reverted back to the unflattened state with the `unflatten_ilm` command.

```
flatten_ilm  
  
report_timing  
  
unflatten_ilm
```

Related Topic

- `flatten_ilm`

update_partition

```
update_partition
[-pin_location]
[-post_eco_suffix postECOSuffix]
{-flex_ilm_eco}
{-golden_block_dir directory}
-flex_ilm_dir directory
[-eco_dir directory]
[-full_netlist_with_eco_dir directory -flex_ilm_eco_dir directory]
```

Creates a new partitioned output that contains the optimised blocks and top. It also performs ECO on the original block. The ECO output is saved as new Tempus database in the partitioned block. The ECO would happen only on flexILM partitions and not the regular blocks.

Note: The ILM is not supported for Signoff in Tempus.

Parameters

-eco_dir <i>directory</i>	Specifies the scratch directory for partitioning and running distributed ECO job after optimization.
-flex_ilm_dir <i>directory</i>	Specifies the new partitioned output directory containing optimized blocks/top and ECO results.
-flex_ilm_eco	Performs ECO on FlexILM modules. Note: This is default.
-flex_ilm_eco_dir <i>directory</i>	Specifies the directory to store the ECO job.
-full_netlist_with_eco_dir <i>directory</i>	Specifies the directory to store the ECO result of the full netlist.
-golden_block_dir <i>directory</i>	Specifies the golden database directory for individual blocks.
-pin_location	Updates new partition pin locations into the golden block DB. This option does not allow new added logic ports.
-post_eco_suffix <i>postECOSuffix</i>	Specifies the suffix name that will be part of generated postECO DB name.

write_ilm

```
write_ilm  
[-help]  
-dir dirname  
[-model_type {timing|si|all}]  
[-no_core_sdc]  
[-no_spef]  
[-no_xtwf]  
[-ignore_ports ListOfPorts]  
[-include_objects ListOfInstancesorNets]  
[-validation_dir]  
[-write_sdf]
```

Creates the specified directory containing the Interface Logic Module (ILM) data for timing analysis and the Extended Interface Logic Module (XILM) data for SI analysis.

The information is saved in the following directories:

For Timing:

- \$dir/ilm_data
 - *.v
 - *.sdc
 - *.spef

For SI:

- \$dir/si_ilm_data
 - *.v
 - *.sdc
 - *.spef
 - *.xtwf

Note: The ILM is not supported for Signoff in Tempus.

Parameters

<code>-help</code>	Prints out the command usage.
<code>-dir <i>dirname</i></code>	Specifies the location of the ILM and XILM files, which are generated in the <code>ilm_data</code> and the <code>si_ilm_data</code> subdirectories, respectively.
<code>-include_objects</code> <i>ListOfInstancesorNets</i>	Accepts a collection of instances and/or nets. All instances and nets specified are preserved in the generated ILM. When instances are preserved, their driving and load nets are also preserved. When nets are preserved, only the driving instances are preserved.
<code>-ignore_ports</code> <i>ListOfPorts</i>	The given ports and the associated interface path(s) which are starting or ending at these ports will not be included in the ILM model.
<code>-model_type</code> { <i>timing si all</i> }	Generates ILM and XILM models. • The <code>-model_type timing</code> parameter creates only ILM models. • The <code>-model_type si</code> parameter creates only XILM models. • The <code>-model_type all</code> parameter creates both the ILM and XILM models.
<code>-no_core_sdc</code>	Does not create the core SDC data for ILM/XILM models.
<code>-no_spef</code>	Does not generate the SPEF data for ILM and XILM models.
<code>-no_xtwf</code>	Does not create the xtwf data for ILM/XILM models. Note: When the <code>-no_core_sdc</code> and <code>-no_xtwf</code> parameters are specified, <code>write_ilm</code> does not call any delay or timing calculation and skips creating both the SDC and XTWF files for ILM/XILM models.
<code>-validation_dir</code>	Creates a script and necessary data used to validate ILM/XILM.
<code>-write_sdf</code>	Creates an SDF file that is based only on the logic kept in the ILM model after netlist is trimmed. In the MMC mode, one SDF file is written for one view.

Examples

- The following command generates the ILM ignoring certain ports and including certain objects in the `BlockB` directory. It also writes out the ILM SDF file under the `BlockB` directory.

```
ilmview > write_ilm -write_sdf -ignore_ports $ignorePorts include_objects
$includeObjects -dir BlockB
```

- In SMSC designs, the following command generates ILM files in the three subdirectories (ilm_setup, ilm_hold and si_ilm_setupHold) under directory BlockB:

```
ilmview > write_ilm -dir BlockB
```
- In MMMC designs, the following command generates ILM files in the one subdirectories (MMMC) under directory BlockB:

```
ilmview > write_ilm -dir BlockB
```

add_route_vias Category Attributes

The root attributes in the `add_route_vias` category are:

- [add_route_vias_auto](#)
- [add_route_vias_ndr_only](#)

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `add_route_vias` category, use the following command:

```
get_db -category add_route_vias
```

add_route_vias_auto

```
add_route_vias_auto {true | false}
```

Default: `false`

Enables auto via generation when design is loaded. The option is of type `bool`.

add_route_vias_ndr_only

```
add_route_vias_ndr_only {true | false}
```

Default: `false`

Generates vias for non default rules only.

check_design

```
check_design
[-help]
[-id violation_id]
[-out_file fileName]
{[-type {power_intent timing hierarchical pin_assign budget assign_statements place opt cts
route signoff all}] | -type_3d {tech_lib netlist power_intent timing place floorplan route
report_only all}} [-format {table detail}][--no_check ]
```

Checks that all prerequisites to run all or part of the hierarchical or block implementation flow are met.

Parameters

-help	Prints a brief description that includes the type and default information for each <code>check_design</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man check_design</code> .
-format {table detail}	Specifies the format for reporting violations. • <code>table</code>: Prints the results in the table format. • <code>detail</code>: Prints details of violations.
-id violation_id	Specifies the violation IDs.

-type

Specifies the category of the flow to be checked:

- `power_intent`: Performs checks related to MSV setup including power domain/fence checks.
- `timing`: Performs checks related to timing setup integrity.
- `hierarchical`: Performs check if the partition has a fence and if the fence is inside the core boundary.
- `assign_pin`: Performs checks related to pin assignment for partitioning flows.
- `budget`: Performs checks related to time budgeting for partitioning flows.
- `assign_statements`: Performs checks for the netlist for assign statements.
- `place`: Performs checks related to placement such as PG rail alignment and pin access issues.
- `opt`: Performs checks related to optimization such as checks for available cells.
- `cts`: Performs checks related to clock tree definition such as constraint targets and route types.
- `route`: Performs checks related to routing such as congestion, placement, and pin access issues.
- `signoff`: Checks related to the signoff activities including extraction and ECOs.
- `all`: Runs all categories.

<pre>-type_3d {tech_lib netlist power_intent timing place floorplan route report_only all}}</pre>	Specifies the 3DIC design categories to check. You can specify single or multiple categories • <code>tech_lib</code> ◦ Checks the library integrity and corrects binding ◦ Checks all timing lib wh • <code>netlist</code> ◦ Checks the library integrity and corrects binding • <code>power_intent</code> ◦ Checks related to MSV setup including power domain/fence checks. ◦ Checks related power domain bind to correct design • <code>timing</code> ◦ Performs checks related to timing setup integrity. • <code>place</code> ◦ Checks related to placement such as pin alignment • <code>floorplan</code> ◦ Checks related to floorplanning • <code>route</code> ◦ Checks related to routing • <code>all</code> ◦ Checks all categories
<pre>-no_check</pre>	Just echo out all the messages that would be checked, don't do any checks Do not run the checks but echo the checks that would run per the categories provided by the user

`-out_file fileName`

Specifies the output report file. Contents dumped to this file in the Tcl format.

design Category Attributes

The root attributes in the design category are:

- `design_backside_bottom_routing_layer`
- `design_backside_top_routing_layer`
- `design_bottom_routing_layer`
- `design_compressed_pg_db`
- `design_cong_effort`
- `design_early_clock_flow`
- `design_ideal_hold_fixing`
- `design_merge_trim_shapes`
- `design_optimization_density_screen_margin`
- `design_pessimistic_mode`
- `design_tech_node`
- `design_top_routing_layer`
- `design_trim_grid_group`

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `design` category, use the following command:

```
get_db -category design
```

design_backside_bottom_routing_layer

```
design_backside_bottom_routing_layer layerName
```

Default: ""

Data_type: string, read/write

Specifies the highest backside LEF layer name for global and detail routing.

design_backside_top_routing_layer

`design_backside_top_routing_layer layerName`

Default: ""

Data_type: string, read/write

Specifies the lowest backside LEF layer name for global and detail routing.

design_bottom_routing_layer

`design_bottom_routing_layer layerName`

Default: ""

Data_type: bool

Specifies the lowest LEF layer name for global and detail routing.

design_compressed_pg_db

`design_compressed_pg_db {true | false}`

Default: true

Data_type: bool

Specifies whether the compressed PG feature is enabled. When it is set to `true`, `read_db` will automatically compress the PG data while loading the design. You can use `get_db current_design .is_pg_compressed` to check if PG in the design is compressed.

design_cong_effort

`design_cong_effort {low medium high auto}`

Specifies the effort level for relieving congestion.

Default: auto

Data_type: enum {low medium high auto}

Specify one of the following values:

- `auto`: Automatically determines whether the design is congested and performs extra congestion driven effort for highly congested designs.
- `high`: Runs more iterations of placement in an effort to achieve better congestion results. This parameter increases the run time.

- **low:** Runs fewer iterations of placement to arrive quickly at a legal placement. This parameter might decrease placement quality.
- **medium:** Runs placement on designs at a normal effort level.

design_early_clock_flow

`design_early_clock_flow {true | false}`

Default: false

Data_type: bool

Enables early clock flow.

design_ideal_hold_fixing

`design_ideal_hold_fixing {true | false}`

Default: false

Data_type: bool, read/write

Enables the ideal hold fixing flow.

design_merge_trim_shapes

`design_merge_trim_shapes {{layers layer_name_list gap gap_value max_merge_num number_of_max_merge masks {mask_num ...}} ...}`

Default: ""

Data_type: string, read/write

Specifies the setting for trim shapes merge.

- **layers:** You use this to specify the trim layer list which needs to merge trim shapes.
- **Gap:** You use this setting when the end to end gap is less the value.
- **max_merge_num:** You use this to specify the max trim shapes number that are merged.
- **masks:** You use this to specify the trim shapes color that needs to be merged.

design_optimization_density_screen_margin

`design_optimization_density_screen_margin {{layers layer_name_list gap gap_value max_merge_num number_of_max_merge masks {mask_num ...}} ...}`

Default: 0.1

Min: 0

Max: 1

Data_type: double, read/write

Increases margin on the top of original density screen for optimization.

design_pessimistic_mode

design_pessimistic_mode {true false}

Default: false

Data_type: enum {true false}

Specifies that the delay calculation compatibility mode should be used for correlating to external signoff analysis tools. This mode adjusts delay calculation settings to ensure the best match to the third party engine while maintaining a degree of pessimism to help limit optimistic outliers in the external signoff analysis tool.

design_tech_node

design_tech_node {N12 N10 N7 N7Plus N6 N5 N3 S11 S10 S8 S7 S5 S4 S3 G7 G5 ICF I7 unspecified}

Default: unspecified

Data_type: enum {N22 N12 N10 N7 N7Plus N6 N5 N5PlusPlus N4 N3 N3E N2 A16 A14 A12 S11 S10 SF8 SF7 SF5 SF4 SF3 SF2 SF1.4 G7 G5 ICF I7 I5 P1222 P1276 P1277 P1278 P1278x P1280 20A 18A C12 C7 unspecified}

Sets the design technology node.

The node value is normally automatically set by `read_physical` while loading the LEF technology and the tool prints a message mentioning the auto-detected node. However, if the auto-detection does not work, you will see a message like this:

```
## Check design process and node:
## Both design process and tech node are not set.
```

In such cases, you will need to set the value directly using `design_process_node` and `design_tech_node`.

design_top_routing_layer

design_top_routing_layer *layerName*

Default: ""

Data_type: string

Specifies the highest LEF layer name for global and detail routing.

design_trim_grid_group

`design_trim_grid_group groupName`

Default: ""

Data_type: string

Specifies the GROUP name of the set from which the trim metal grid will be used for placement and routing.

If the specified group name does not exist in LEF, the tool will return an ERROR.

init_design

`init_design [-help]`

Initializes the database and ensures that the tool is ready for full execution.

During `init_design`, the tool steps through the defined MMMC objects, the design object, and the power requirements and builds up the full representation of the design. After initialization is complete, the design is in a consistent state and is ready for manipulation (floorplanning, synthesis, and so on) or timing.

The `init_design` command corresponds to the *Init* step in the Initialization flow. In this step, the full database is prepared for execution. The constraints are loaded into the correct mode, the power data is loaded and applied to the appropriate instances, and the operating conditions are applied to the power domains. Extensive error checking is performed, including checking of objects, and checking for completeness of data. After the *Init* step is complete, the database is completely consistent and ready for execution.

Timing

Physical

Design

Power

Init

The `init_design` command can be broken into the following sub-steps, which are executed by the tool without requiring any user intervention:

1. Power Domain Creation

First, the power domains are populated by the design data. The design instances associated with a particular domain are defined in the Common Power Format (CPF) or UPF file. This instance data is used to populate the power domain attributes. At the end of this sub-step, the different power domains are resolved, and every instance in the system is associated with its power domain.

2. Power Domain Binding to Domain Corners

After the power domains are fully resolved, they can be bound to the library sets in the various `create_domain_corner` commands. In this sub-step, the active domain corners are processed with each instance getting assigned to the appropriate library set.

3. Power Domain Object Processing

After the power domains are associated with library sets, the power domain objects (state retention, iso cells, and level shifters) can be processed. The power object rules are processed against the defined library sets for each domain to identify the power cells to be used.

4. Constraint Loading

During constraint loading, the SDC files required by the active view are loaded and error checking is done. In addition, the RC corner defined by the required domain corner is processed and loaded. In both cases, syntax and error checking is performed.

5. Active View Setting

The final step is to set the active view based on the `set_active_view` command, and to perform final checks to ensure the view is fully and completely defined. At the conclusion of this command, the system is ready for timing.

After a design has been initialized with `init_design`, the design is ready for execution - which can include incremental updates to timing.

Note: The annotation data, such as SPEF or SDF, cannot be loaded if the design has not been initialized properly with the `init_design` command.

Timing Incremental Updates

After `init_design`, you can enter MMMC commands at the command line. These commands populate the mmmc database objects, and perform error checking to report missing objects. For example, if you create a timing condition involving libsets that do not exist, an error will be issued. No data load takes place during command entry. Instead, the loading of new libraries, constraints, and so on, is deferred until an additional `init_design` is entered.

After you have completed entering the MMMC commands, issue the `init_design` command to load the new timing intent. After `init_design` is complete, the database is ready for timing again.

The exception to requiring `init_design` is `set_analysis_view`. When this command is issued and datasets are not present in memory, the tool will effectively issue an `init_design` to load in the required data. If the data is already in memory, the view information is changed without any additional load.

Note: Design data (netlist) and physical data (LEF/OA) incremental update is not allowed. After the first `init_design` is completed, these steps are effectively disabled. If you issue a `read_netlist` or `read_physical` command after the first `init_design`, the tool returns an error.

Parameters

-help	Prints out the command usage. For a detailed description of the command, use the <code>man</code> command: <code>man init_design</code>
-------	---

Related Topics

- `init` Category Attributes
- `read_netlist`
- `read_physical`

init Category Attributes

The root attributes in the `init` category are:

- `init_check_netlist`
- `init_delete_floating_hnets`
- `init_keep_empty_modules`
- `init_read_netlist_allow_port_mismatch`
- `init_read_netlist_allow_undefined_cells`
- `init_oa_tech_lib`
- `init_power_intent_files`
- `init_sync_relative_path`
- `init_timing_enabled`
- `init_tiers`

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `init` category, use the following command:

```
get_db -category init
```

init_check_netlist

```
init_check_netlist {true | false}
```

Default: `false`

Data_type: `bool`

After reading in the netlist, it performs the same checks as `check_design -netlist`.

init_delete_floating_hnets

```
init_delete_floating_hnets {true | false}
```

Default: `true`

Data_type: bool

If true, an hnet (Verilog wire statement) that has nothing connected to it, is deleted from the netlist. The default value is true in Tempus to delete non-timed nets and reduce memory.

init_keep_empty_modules

```
init_keep_empty_modules {true | false}
```

Default: true

Data_type: bool

Keeps empty modules. If set to false, the software converts the empty modules into special leaf cells that do not have a physical library associated with them.

If the module is a hard macro, using a value of true or false produces the identical behavior: the software keeps the module.

Related Commands

- [read_db](#)

init_read_netlist_allow_port_mismatch

```
init_read_netlist_allow_port_mismatch {true | false}
```

Default: false

Data_type: bool

Specifies whether new Instance ports can be created during Verilog netlist parsing.

init_read_netlist_allow_undefined_cells

```
init_read_netlist_allow_undefined_cells {true | false}
```

Default: false

Data_type: bool

Creates a dummy .lib file and a user-defined noise model (UDN) for cells that are not present in the loaded .lib or cdB.

init_oa_tech_lib

`init_oa_tech_lib lib_name`

Default: ""

Data_type: string, read/write

Specifies the OpenAccess library to use as a source of technology information. If not specified, the first library in the `init_oa_ref_lib` list will be used. Applies only when `read_netlist` is used to process a Verilog netlist. It is set by the `read_physical -oa_tech_lib` command.

init_power_intent_files

`init_power_intent_files string`

Default: ""

Data_type: string

Specifies the power intent files read by the previous run of the `read_power_intent` command.

init_sync_relative_path

`init_sync_relative_path {true | false}`

Default: false

Note: You must change your working directory to the directory saved in the previous design session before you restore the design.

Data_type: bool

Synchronizes all relative paths in the `top.globals` file to the current working directory. Use this parameter if you want to restore the design without first changing your current working directory to the directory saved in the previous design session.

Example

- The following command synchronizes all relative paths to the current working directory:

```
set_db init_sync_relative_path true
```

Related Commands

- `read_db`

init_timing_enabled

`init_timing_enabled {true | false}`

Default: `true`

Data_type: `bool`

If `read_physical` is issued before `read_mmmc` or `read_libs` in Genus and Tempus, an error will be issued. In Innovus, doing this will result in `init_timing_enabled` being set to `false` by the tool. Innovus is now in physical only mode, and any attempt to set timing data will result in an error.

Related Commands

- `read_physical`
- `read_mmmc`
- `read_libs`

init_tiers

`init_tiers string`

Default: `""`

Data_type: `string`, read/write

Specifies the orientation of each tier, either 'up' or 'down', starting with the bottommost, for a multi-tier design in `init_design`. You can specify the orientation of each tier using the keywords `up` or `down`, starting from the bottommost tier. At least two tiers must be defined; specifying a single tier is not allowed and results in an error.

Examples (two-tier designs):

- { up down } – Face-to-Face (F2F)
- { down up } – Back-to-Back (B2B)
- { up up } – Face-to-Back (F2B)
- { down down } – Face-to-Back (F2B)

For designs with more than two tiers, you need to add additional entries for Tier2, Tier3, and so on. Only the up and down keywords are accepted.

read_db

```
read_db
[-help]
[-debug]
[-module_dirs list_of_dirs]
[-no_timing_graph]
[-read_globals tcl_file_name]
[-physical_data]
{[<in_dir> [-mmmc_file <string>]] | [-oa_lib_cell_view {<libname> <cellname> <viewname>} [-mmmc_file <string>] [-lef_files list_of_files]]}
[-setup_views <string> -hold_views <string>]
[-leakage_view <string> -dynamic_view <string>]
```

Loads the saved design files of a previous design session. The files included depend on the work completed in the design session when it was saved. The directory can include floorplan files, special route files, placement files, early global route files, and power switch state files.

To restore designs saved in Tempus format, usage is as follows:

```
read_db {sessionName.dat}
```

Note: You must rebuild the timing graph after you restore the design. Run extraction, then timing analysis.

You must specify all pin types in the LEF file. Without these definitions, the Tempus software attempts to determine the pin type from the pin name when restoring a design, and does not always do this correctly. If this is the case, Tempus generates the following error message:

```
**ERROR: Current net list does not match wires file.
```

❗ Modifying the contents of the `sessionName.dat` directory created by `saveDesign` can cause major unexpected results. Never modify the `design.dat` directory contents.

To restore OpenAccess designs, usage is as follows:

```
read_db
{-oa_lib_cell_view string}
```

You can use the `read_db` command after starting the Tempus software.

Note: Tempus supports only the following begin/end extension values for DEF_{NETS} style wiring segments (0, width/2 or LEF_{LAYER WIREEXTENSION}). If any of the wire extensions has unsupported extension value, then Tempus converts it to a special wire (DEF_{SPECIALNETS}). While writing back OpenAccess, these special wires will again be converted back to DEF_{NETS} style wiring.

From the 14.1 release, the `read_db` command accepts a tar file, when a tar ball is given. For instance, if

you specify the following command:

```
read_db myDesign.inn.dat.tar.gz
```

`read_db` will untar the tar ball under the current working directory, restore the design, and then remove the temporary data directory. This enables a single DB file operation all the time.

Parameters

<code>-help</code>	Prints a brief description that includes the type and default information for each <code>read_db</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man read_db</code>
<code>-dynamic_view string</code>	Specifies the analysis view for the dynamic power analysis.
<code>-debug</code>	Enables debug data.
<code>-hold_views string</code>	Specifies the hold views for loading, rather than the hold views active during <code>write_db</code> .
<code>in_dir</code>	Specifies the <code>.dat</code> directory from which to load the files. If the session name of the saved design includes the extension <code>.enc</code> , make sure that you include this extension in the <code>in_dir</code> name: for example, <code>session1.enc.dat</code> .
<code>-leakage_view string</code>	Specifies the analysis view for leakage power analysis.

<pre>-lef_files list_of_files</pre>	Specifies the LEF files name for loading. Use this option if you want to override the existing LEF files in the design being restored and load different LEF files instead. • This option is intended to allow upgrading to new versions of LEF files that are compatible with the old versions. The list of all LEF files used by this design must be given. • If any pin locations or cell boundaries or OBS shapes are changed for used cells, new DRC violations may occur. • If pins are added or removed from used cells, or used cells are removed, fatal errors may occur when loading the netlist. • If the removed pins and cells are unused in the design, warnings or errors may still occur if any library-specific data was stored for those cells or pins during the design flow (such as dont_touch data) Examples Existing LEFs used by <code>write_db:tech.lef</code>, <code>A.lef</code> You can change <code>A.lef</code> to <code>A_v2.lef</code> as given below: <pre>read_db place.dat -lef_files {tech.lef A_v2.lef}</pre>
<pre>-mmmc_file</pre>	Specifies the path name to a Multi-Mode/Multi-Corner (MMMC) configuration file (<code>viewDefinition.tcl</code>). Use this option if you want to override the settings in the existing MMMC configuration file in the design being restored and instead load a different MMMC file.
<pre>-module_dirs list_of_dirs</pre>	Specifies module-level sessions which should override the corresponding modules in the top-level hierarchical session.
<pre>-no_timing_graph</pre>	Restores the design data without a timing graph.

<code>-oa_lib_cell_view <i>string</i></code>	Specifies the library name, cell name, and view name for restoring design information from the previous design session in the OpenAccess database format.
<code>-physical_data</code>	Enables physical data to be read.
<code>-read_globals <i>tcl_file_name</i></code>	Specifies the UDM variables to be honored when restoring the design. You need to provide a tcl file stating the pre-defined UDM variable names to be honored.
<code>-setup_views <i>string</i></code>	Specifies the setup views for loading rather than the setup views active during <code>write_db</code> .

Examples

- The following command loads the saved design files from the `test.inn.dat` directory:
`read_db test.inn.dat`
- The following command restores the `my.enc.dat` design without loading the timing libraries and MMMC configuration information:
`read_db -no_timing_graph my.inn.dat`
- The following command restores the `placed.enc.dat` design but overrides the existing MMMC settings in the design with the settings in the `new_mmmc.tcl` file:
`read_db placed.inn.dat -mmmc_file new_mmmc.tcl`
- The following command restores the "designLib top placed" OpenAccess cellview but overrides the existing MMMC settings in the design with the settings in the `new_mmmc.tcl` file:
`read_db -oa_lib_cell_view "designLib top placed" -mmmc_file new_mmmc.tcl`

Related Topics

- [write_db](#)

read_def

```
read_def
[-help]
[def_file]
[-design]
[-design_offset (x y)]
[-design_orient orientation]
[-force_create_phys_inst]
[-keep_pin_geometry]
[-preserve_shape]
[-rdl_def def_file]
[-rdl_offset (x y)]
[-rdl_orient orientation]
[-read_flat_dir directoryName]
[-skip_pg]
[-skip_signal_nets]
[-top_scope | -top_scope_ignore_block_internal_nets_on_boundary_path []]
[-write_flat_dir directoryName]
```

Reads a single DEF file. This command can be used to supply single DEF to generate a physical database.

This command can be used at any step after importing a design. The typical usage is:

- Load a DEF file containing the floorplan saved by Tempus or other tool.
- Load a DEF file containing the scan chain information so that placement can do scan chain reorder.
- Load a DEF file containing the cell's placement and routing saved by Tempus or other tool.

The `read_def` command cannot read multiple or hierarchical DEF files. To read multiple or hierarchical DEF files and create a flattened database, use the `read_hierarchical_def` command.

 When you load a DEF file, you must be at the same level in the hierarchy where the DEF file was saved.

The Tempus software loads the DEF file information into the database in several ways, depending on the object:

- Tracks, gcells, rows, die area
The software deletes all of the existing objects in the database and reads in the new information.

Note: The `read_def` command can read a rectilinear die area, but converts it to a rectangular die

area with blockages at the cut off area.

- Blockages, fills, special nets

The software compares the physical data (such as shape and layer) to the existing data in the database. If it finds the same data in the database, it ignores the data in the DEF file. If the data does not already exist, the software adds it to the database. For special nets, the software merges wire segments in the DEF file with any existing ones in the database that overlap and have the same attributes, such as layer, width, shape, and direction. The software does not delete any existing data.

- Nondefault rules, vias

The software adds the objects to the database if they do not already exist there. If a nondefault rules definition with the same name already exists, the software ignores the one in the DEF file. If a via definition with the same name already exists, and the via is a fixed via, the software ignores the one in the DEF file. If a generated via definition with the same name already exists, the geometries are read, but the name might be changed. The software does not delete any existing objects of these types.

- Nets

For each net in the DEF file, the software removes the existing regular routing (not special routing), then adds the routing from the DEF file for this net.

- Pins

For each pin in the DEF file, the software removes the existing physical information for the pin, then adds the physical information from the DEF file for this pin. If a pin does not already exist, and it is a power or ground pin, the software adds it to the database. If the pin is not a power or ground pin, the software generates an error message.

- Groups, regions

If a group name in the DEF file matches an existing hierarchical instance name in the database, the region's boundary constraint is attached to the hierarchical instance, overriding any existing boundary constraint. The software checks whether the group members belong to the hierarchical instance, and generates a warning message if any do not belong. If a group name does not match any hierarchical instance name, the software creates the instance group with an attached region boundary constraint, if one exists. Regions that are not used by groups in the same DEF file are ignored. The software does not remove existing groups.

Note: You can import DEF files containing wildcards (*) in the `GROUPS` statement. The `read_def` command does not support multiple groups per region.

- Components

You cannot add new logical cells. You can add new physical cells, such as:

- Cells with `CLASS PAD`
- Cells with `CLASS COVER` and no signal pin

- Instance with + SOURCE DIST

You can use the `read_def` command after importing a design.

⚠ After loading the DEF netlist using the `read_def -verilog_from_def_netlist_flow` command, you can perform floorplanning, non-timing driven placement and routing, wire Innovusting, and verification. You cannot use the DEF netlist flow for parasitic extraction, delay calculation, and timing-driven placement and routing effectively because the DEF names do not properly match the Verilog names used in timing constraints and timing analysis.

Parameters

<code>-help</code>	Prints a brief description that includes the type and default information for each <code>read_def</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man read_def</code>
<code>def_file</code>	Specifies the names of the DEF files to load.
<code>-design</code>	Specifies to read def files with the same top cell name
<code>-design_offset (x y)</code>	Specifies the placement for the top cell.
<code>-design_orient orientation</code>	Specifies the orientation for the top cell.
<code>-force_create_phys_inst</code>	Specifies to force create physical cell instances.
<code>-keep_pin_geometry</code>	Keeps pins shapes equivalent to the block pin shapes, in the form of special route.
<code>-preserve_shape</code>	Prevents creation of symbolic center-line connected routing data and preserves the routing data as-is.
<code>-rdl_def def_file</code>	Specifies the RDL def file.
<code>-rdl_offset (x y)</code>	Specifies the offset of RDL def.
<code>-rdl_orient orientation</code>	Specifies the orientation for RDL def.
<code>-read_flat_dir directoryName</code>	Reads flat data from the specified directory.
<code>-skip_pg</code>	Skips merging routing on pg nets.
<code>-skip_signal_nets</code>	Specifies to skip reading signal nets.
<code>-top_scope</code>	Specifies to merge routing on top scope nets only.
<code>-top_scope_ignore_block_internal_nets_on_boundary_path</code>	Specifies merging routing on top scope nets which are not block internal nets on boundary path.
<code>-write_flat_dir directoryName</code>	Writes flat data to the specified directory.

Examples

- The following command reads the compressed DEF file `dma_mac_filled.def.gz`:

```
tempus > read_def dma_mac_filled.def.gz
```

Related Commands

- [read_hierarchical_def](#)
- [write_def](#)

read_instance_voltage

```
read_instance_voltage
[-help]
[-early]
[-ir_drop <<fileName>>]
[-late]
[-list]
[-max]
[-min]
[-reset]
```

Loads the instance-based IR-drop information that is output by power-rail analysis tools, such as Voltus, to account for the effects of IR drop when calculating the delays and slews. You can read in four different files for early-max, early-min, late-max, and late-min IR-drop analysis.

Parameters

-help	Prints out the command usage.
-early -late	Applies the effects of IR-drop to the early path (data hold/clock setup) or late path (data setup/clock hold) in your design. Use the -early or -late parameter in conjunction with the -min or -max parameter to account for the effects of early-max, early-min, late-max, or late-min IR-drop analysis.

<code>-ir_drop</code> <code><<fileName>></code>	Specifies the names of the IR-drop files to load. The format of an IR drop file is shown below: <pre> VERSION "2.0" CREATION "Tue Jul 21 02:10:15 2015" CREATOR "user1" PROGRAM "Vendor" DIVIDERCHAR "/" DESIGN "design1" UNITS VOLTAGE VOLT 1 INSTANCE_COUNT 1379138 NOMINAL_VOLTAGE 1.1 POWER_NET vdd GROUND_NET gnd WINDOW SWITCHING_AND_TIMING RP_VALUE IV/EIV RP_FORMAT BRIEF RP_INST_LIMIT 2000000000 RP_THRESHOLD -1e+06 RP_PIN_NAME FALSE INSTANCESUPPLY 1379138 vdd 1.1 EFFECTIVE BEGIN - ICC_PRECTS_33 0.95948 C12T28SOI_LLTHP_XOR2X33_P16 - ICC_PRECTS_5 0.96383 C12T28SOI_LL_CNNAND2X15_P16 - u_stc2/ICC_RTO_TIMING_6 0.96524 C12T28SOI_LLBR1P2NHP_BFX34_P16 - u_ca7_scu_lld_tagrams/U207 0.96705 C12T28SOI_LLBR1P8NHP_BFX48_P16 - u_ca7_scu_lld_tagrams/U244 0.96759 C12T28SOI_LLBR1P2NHP_BFX43_P16 </pre>
<code>-list</code>	Provides a list of all specified IR-drop files.
<code>-min -max</code>	Applies the effects of IR-drop to the minimum operating condition or maximum operating condition. Use the <code>-min</code> or <code>-max</code> parameter in conjunction with the <code>-early</code> or <code>-late</code> parameter to account for the effects of early-max, early-min, late-max, or late-min IR-drop analysis. Note: If the <code>-min</code> or <code>-max</code> parameter is used without the <code>-early</code> or <code>-late</code> parameter, the IR drop is applied to both early and late analysis. To apply the IR drop for late analysis only, use the <code>-min</code> or <code>-max</code> parameter with the <code>-late</code> parameter. To apply the IR drop for early analysis only, use the <code>-min</code> or <code>-max</code> parameter with the <code>-early</code> parameter.
<code>-reset</code>	Resets all IR-drop files.

Examples

- The following commands apply the IR drop for early-min, late-min, early-max, and late-max IR-drop analysis:

```
tempus > read_instance_voltage -early -min -ir_drop { earlymin.ir }  
tempus > read_instance_voltage -late -min -ir_drop { latemin.ir }  
tempus > read_instance_voltage -early -max -ir_drop { earlymax.ir }  
tempus > read_instance_voltage -late -max -ir_drop { latemax.ir }
```

- The following commands apply the IR drop for late-min and late-max IR-drop analysis:

```
tempus > read_instance_voltage -late -min -ir_drop { latemin.ir }  
tempus > read_instance_voltage -late -max -ir_drop { latemax.ir }
```

- The following commands apply the IR drop to early and late IR-drop analysis:

```
tempus > read_instance_voltage -early -ir_drop { early.ir }  
tempus > read_instance_voltage -late -ir_drop { late.ir }
```

read_libs

```
read_libs
[-help]
[<in_file <file1[<file2> ...>>]
[-aocv_libs <string>]
[-lef_files <string>]
[-library_side_file <string>]
[-aocv_libs aocvLibs]
[-max_aocv <string>]
[-max_libs maxLibs]
[-max_noise_libs maxNoiseLibs]
[-min_aocv <string>]
[-min_libs minLibs]
[-min_noise_libs minNoiseLibs]
[-noise_libs noiseLibs]
[-oa_ref_libs oaLibs]
[-power_ground_files powerGridLibFiles]
[-socv_libs soceLibs]
```

Schedules reading of one or more technology library files. These files either contain timing-related or noise-related information for the primitive cells used in the design.

Timing libraries can be in text format or Cadence binary library format (LDB). The LDB (library database) files generated from other tools, like Innovus, Voltus, or Genus are read in to Tempus with an error message (TECHLIB-1249). The LDB files are not forward compatible, that is, a LDB generated from 15.2 version cannot be used with 15.1 or prior versions of the software.

Note: The `read_libs` command determines the priority of ECSM vs CCS data (if both are present). The software first checks for ECSM construct, if it is missing then CCS construct is loaded.

Note: You can use wildcards with the `read_libs` command as follows:

```
read_libs [glob *.lib]
```

Parameters

<code>-help</code>	Prints a brief description that includes the type and default information for each <code>read_libs</code> parameter.
<code><in_file <file1[file2] ...></code>	Specifies to read the library files.
<code>-aocv_libs <i>aocvLibs</i></code>	Specifies to read the default AOCV libraries.
<code>-lef_files <string></code>	Specifies the name of the LEF files to be loaded.
<code>-library_side_file <string></code>	Specifies to read the default incremental files.
<code>-max_aocv <i>string</i></code>	Specifies to read the max AOCV libraries.
<code>-max_libs <i>maxLibs</i></code>	Specifies to read the max libraries.
<code>-max_noise_libs <i>maxNoiseLibs</i></code>	Specifies to read the CDBs for max noise analysis.
<code>-min_aocv <i>string</i></code>	Specifies to read the minimum AOCV libraries.
<code>-min_libs <i>minLibs</i></code>	Specifies to read the min LIBs.
<code>-min_noise_libs <i>minNoiseLibs</i></code>	Specifies to read the CDBs for min noise analysis.
<code>-noise_libs <i>noiseLibs</i></code>	Specifies to read the default CDB files for noise analysis.
<code>-oa_ref_libs <i>oaLibs</i></code>	Specifies to read the OA reference library.
<code>- power_ground_files <i>powerGridLibFiles</i></code>	Specifies to read the power grid library files.
<code>-socv_libs <i>soceLibs</i></code>	Specifies to read the default SOCV libraries.

read_mmmc

```
read_mmmc  
[-help]  
file_name
```

Reads in the Multi-Mode, Multi-Corner (MMMC) file. MMMC refers to the full set of timing libraries, constraints, and the associated modes.

When the `read_mmmc` command is run, the MMMC file is read and processed. The majority of elements in the MMMC control file is saved in the MMMC caching attributes. Except for the library sets defined by the first `set_analysis_view` command, no data is loaded into the database. This command does basic syntax checking on the MMMC commands, rejecting commands that have incorrect options and commands that are not MMMC or tcl commands. However, no consistency checking is performed. For example, if a constraint mode is used in an analysis view, but is not defined, it will not be flagged.

The MMMC file contents are cached in attributes in the database. These attributes allow you to write out a full and complete MMMC file later in the flow. In addition, the names of the MMMC files are cached for querying.

The exceptions to data set load are the libraries pointed to by the first `set_analysis_view` command in the MMMC file. These library sets are loaded into the database. This load uses the standard library parser, and includes standard library syntax checking.

The `read_mmmc` command corresponds to the *Timing* step of the Initialization flow:

In the *Timing* step, the MMMC objects are set up by populating the basic MMMC information attributes. As Synthesis needs library information before the *Design* step, the *Timing* step also loads some library information. The library data to be loaded is pointed to by the first `set_analysis_view` command in the MMMC file.

See **Example** section for more details.

At a minimum, the MMMC file must contain one each of:

```
create_library_set
create_rc_corner
create_timing_condition
create_delay_corner
create_constraint_mode
create_analysis_view
set_analysis_view
```

If the MMMC file does not contain this minimum set, an error will be issued.

Note: The library sets can be specified with absolute paths in the MMMC, or relative to the local directory or to library search path attributes. The tool first attempts to load based on the name in the MMMC. If the library is not found, the tool sweeps through the search directory list in the specified order. Only the first hit is loaded.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>read_mmmc</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man read_mmmc</code>
<code>file_name</code>	Specifies the name of the MMMC file.

Examples

When reading an MMMC file with `read_mmmc`, the tool sets the MMMC attributes with the data specified in the file. When the first `set_analysis_view` command is processed, the tool loads in the libraries specified by this analysis view. No other data is loaded.

For example, consider an MMMC file with the following commands:

```
create_library_set -name LS1 -timing [list lib1.lib lib2.lib lib3.lib]
create_library_set -name LS2 -timing [list lib4.lib lib5.lib lib6.lib]
create_library_set -name LS3 -timing [list lib7.lib lib8.lib lib9.lib]
create_rc_corner -name QX -qrc_tech file.qrc
create_timing_condition -name TC1 -library_set LS1
create_timing_condition -name TC2 -library_set LS2
create_timing_condition -name TC3 -library_set LS3
create_delay_corner -name DC1 -timing_condition {TC1 PD2@TC2} -rc_corner QX
create_delay_corner -name DC2 -timing_condition {TC1 PD2@TC3} -rc_corner QX
create_constraint_mode -name CM1 -sdc_files cond1.sdc
```

```
create_constraint_mode -name CM2 -sdc_files cond2.sdc  
create_analysis_view -name AV1 -constraint_mode CM1 -delay_corner DC1  
create_analysis_view -name AV2 -constraint_mode CM2 -delay_corner DC2  
set_analysis_view -setup AV1 -hold AV2
```

When the `set_analysis_view` command is processed, the tool traces backwards from that command to determine the library set. In this case, the analysis view specified by `set_analysis_view` is AV1. The AV1 analysis view points to domain corner DC1, which in turn points to two library sets, LS1 and LS2. As a result, lib1.lib and lib2.lib are loaded into the database.

In this case, lib3.lib is not loaded into the database during `read_mmmc` because it is not in the library sets required by the analysis view.

Related Commands

- `write_mmmc`
- `init_design`
- `read_physical`
- `read_netlist`

read_netlist

```
read_netlist  
[-help]  
{{<in_file> | -oa_cell_view {lib cell view}} [-top top_module_name]}
```

Reads in a Verilog structural netlist. A structural Verilog file contains only structural Verilog-1995 constructs, such as module and gate instances, concurrent assignment statements, references to nets, bit-selects, part-selects, concatenations, and the unary ~ operator.

`read_netlist` also supports OpenAccess through the `-oa_cell_view` option.

The `read_netlist` command corresponds to the *Design* step of the Initialization flow:

During the *Design* step, the design is loaded into the database with `read_netlist`. After issuing this command, the database objects are populated and can be queried and manipulated (ungrouped, renamed, and so on). Full error checking is performed on the design details. This includes, but is not limited to, unresolved references, port mismatches, and empty modules.

Parameters

<code>-help</code>	Prints a brief description that includes the type and default information for each <code>read_netlist</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man read_netlist</code> .
<code><in_file></code>	Specifies the list of netlist files.
<code>-oa_cell_view {lib cell view}</code>	Specifies the name of the design object to be loaded in <code>{lib cell view}</code> format. No other options can be used if this option is specified.
<code>-top top_module_name</code>	Specifies the top module name. By default, <code>read_netlist</code> identifies the highest module and links to that. If there are multiple top modules, the command returns an error.

Related Topics

read_physical

```
read_physical  
[-help]  
{[-oa_ref_libs lib1 [lib2] ... [-oa_search_libs lib1 [lib2] ...] [-oa_tech_lib lib1 [lib2]  
...]] | -lefs lib1 [lib2] ... } [-add_oa_ref_libs lib1 [lib2] ... [-oa_lib_path libPath]] | -  
add_lefs lib1 [lib2] ... }
```

Reads the physical library information. When this command is run, the physical library information is loaded into the database. Both LEF and OA are supported, but not simultaneously.

The `read_physical` command corresponds to the *Physical* step of the Initialization flow:

During the *Physical* step, the physical libraries (OA or LEF) are loaded into the tool's database using `read_physical`. When the command is issued, the database is loaded with the specified objects, and is available for querying of attributes associated with the physical data, such as size, layer details, and so on.

The tool uses the standard OA parser, and performs full error checking on the physical data. When the command is complete, a full timing library set and a physical library set would have been loaded into the database.

If `-lef` is used, the technology LEF must be first specified.

This command is optional for Synthesis and STA, but is required for Implementation.

The tool can support a physical only mode when the attribute `init_physical_only` is set to `true`. This attribute must be set prior to `read_physical`, otherwise an error will be issued.

Parameter

<code>-help</code>	Prints a brief description that includes type and default information for each <code>read_physical</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man read_physical</code>
<code>-add_lefs lib1 [lib2]</code>	Specifies a list of LEF files to read and to add to the original list of LEF files that were added before <code>init_design</code>. This option can only be used after <code>init_design</code>, and cannot be combined with any other option. You can add new macros, non-default rules, sites etc. using this option, but you cannot use it to modify any existing LEF data that is already loaded. The LEF files added using this option will be used when the saved design is loaded again using <code>read_db</code>.
<code>-add_oa_ref_libs lib1 [lib2]</code>	Specifies the list of OpenAccess library names to be loaded incrementally. These library names are added in the <code>cds.lib</code> file, if not present. Use this parameter to specify standard cell libraries or I/O driver libraries that should all be loaded after the design is read.
<code>-lefs lib1 [lib2] ...</code>	Specifies the list of LEF files to be loaded. The first LEF file must have the technology section present. The file names are saved to the <code>init_lef_files</code> root attribute. This option cannot be combined with <code>-oa_ref_libs</code>. Note: This option can only be used before <code>init_design</code> or <code>read_db</code>. If you specify this option after <code>init_design</code>, the tool will give an error.

<code>-oa_ref_libs lib1 [lib2] ...</code>	Specifies the list of OpenAccess library names to be loaded. These names must also be listed in the <code>cds.lib</code> file. All the abstract views in the specified libraries are loaded. Use this parameter to specify standard cell libraries or I/O driver libraries that should all be loaded, even if some of the cells are not currently used in the netlist. The first OpenAccess library that is specified is also used to load the OpenAccess technology data. The specified library names are saved to the <code>init_oa_ref_libs</code> root attribute.
<code>-oa_lib_path libPath</code>	Specifies the path of oa reference libraries. This option can only be used with the <code>-add_oa_ref_libs</code> option.
<code>-oa_search_libs lib1 [lib2] ...</code>	Specifies the list of OpenAccess libraries to be searched. This parameter can be specified only with <code>-oa_ref_libs</code>. As the netlist is read, these libraries are searched for cell abstracts to be load on demand for any Verilog module that does not have a <code>lib_cell</code> already defined. This parameter is typically used for libraries of block IP, such as RAMs, where only the abstracts that are actually used in the netlist need to be loaded.
<code>-oa_tech_lib lib1 [lib2] ...</code>	Specifies the OA tech file to use if the netlist is coming from Verilog rather than an OA cellview.

read_physical Category Attributes

The root attribute in the `read_physical` category is:

- `read_physical_extend_polygon_cell_shapes`
- `read_physical_check_antenna`
- `read_physical_check_colored_shape`
- `read_physical_merge_multi_port_to_single_port`
- `read_physical_must_join_all_ports`

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `read_physical` category, use the following command:

```
get_db -category read_physical
```

read_physical_extend_polygon_cell_shapes

```
read_physical_extend_polygon_cell_shapes { {layer extension_amount}... }
```

Default: ""

Data_type: string

Specifies a list of layer and a value for creating obs shape for 2D pin/obs shapes. Cells could have 2D objects, which require larger line-end spacing. You can use `read_physical_extend_polygon_cell_shapes` to automatically add SPACING 0 OBS for routing during LEF in.

For any 2D shapes, you can extend edges that are perpendicular to the preferred routing direction of the rectilinear shape by specifying the `extension_amount` in `read_physical_extend_polygon_cell_shapes`.

read_physical_check_antenna

```
read_physical_check_antenna {true | false}
```

Default: true

Data_type: bool

If you set `read_physical_check_antenna` to true, LEF or OA cells will have process antenna consistency

checks done for LEF ANTENNA* data (or OA equivalent data) attached to their pins. Input pins with 0 gate-area, output pins with 0 diff-area, and inout pins with 0 gate-area or 0 diff-area values will generate warnings. If `false`, the tool will not perform consistency checking.

read_physical_check_colored_shape

```
read_physical_check_colored_shape {true | false}
```

Default: `false`

Data_type: `bool`

Specifies to check and ignore colored shapes on colorless layers while reading the LEF or DEF data. When set to `true`, the tool errors out if a colored shape is on a colorless layer. When set to `false`, the tool gives error message and ignores the color.

read_physical_merge_multi_port_to_single_port

```
read_physical_merge_multi_port_to_single_port {true | false}
```

Default: `false`

Data_type: `bool`

When set to `true`, multiple ports in a LEF PIN are merged into a single port. However, the pin should not have the `MUSTJOINALLPORTS` attribute as it specifies that all of the ports must be connected individually.

read_physical_must_join_all_ports

```
read_physical_must_join_all_ports {true | false}
```

Default: `true`

Data_type: `bool`

If set to `false`, the `LEF_MUSTJOINALLPORTS` property on a LEF PIN auto-creates `MUSTJOIN` pins for each `PORT`. If set to `true`, the `MUSTJOIN` pins are not created, but the router must connect to every port with a signal wire or signal via that physically overlaps all the ports.

Related Command

[read_physical](#)

read_rcdb

```
read_rcdb  
[-help]  
dirName
```

Restores the parasitic data that was previously saved with the `write_rcdb` command.

When you use the `read_rcdb` command, the design data must be the same as when you use the `write_rcdb` command. You can restore the parasitic data on systems that are same as those used for saving the data. For example, if the data was saved on Linux in 32bit mode, you can restore it on Linux 32 bit mode only.

 Restoring RCDB that you generated using previous major version(s) of the software is not supported and might result in an error. Use `write_rcdb` to generate a new RCDB.

Parameters

<code>-help</code>	Prints out the command usage.
<code>dirName</code>	Specifies the name of the parasitic file that you saved using the <code>write_rcdb</code> command. Note: The parasitic file must have the <code>.rcdb.d</code> extension.

Examples

- The following command reads an Encounter RC extracted database:

```
tempus > read_rcdb test.rcdb.d
```

Related Commands

- `write_rcdb`

read_sdc

```
read_sdc  
[-help]  
[-reset]  
sdc_files
```

Loads a timing constraints file. By default, the constraints files are loaded incrementally.

The constraints can be in the design constraints (SDC) format, or they can be more complicated Tcl constraints embedded in a Tcl script using commands such as [get_property](#) and [filter_collection](#).

A list of constraints files can also be specified in the configuration file.

Parameter

<code>-help</code>	Prints out the command usage.
<code>-reset</code>	Replaces all the previously loaded constraints information with the details specified in the specified SDC file.
<code>sdc_files</code>	Specifies the timing constraints file.

Examples

- The following command reads a SDC file called dma_mac_m.sdc:

```
tempus > read_sdc dma_mac_m.sdc
```

Command Order

Use this command after importing the design and loading the timing library.

Related Commands

- [write_sdc](#)
- [read_sdc](#)

relink_db_files

```
relink_db_files
[-help]
-db_dir db_directory
-new_lib_dirs {new_lib_directory1 new_lib_directory2 ...}
```

Relinks symbolic links to library files inside a DB directory.

By default, `write_db` saves the location of library files as symbolic links under `<db_dir>/libs/...`. When a DB directory is copied to a new network where all the libraries are in a different location, or a new version of the library files are needed, you can use `relink_db_files` to change the symbolic links to new locations .

The `relink_db_files` command will search each `-new_lib_dirs` directory and the sub-directory tree below it for each library file name inside `<db_dir>`, and create a symbolic link to the new location. Only the base file name is used for the search (except for `qrcTechFile`). Therefore, two path names inside the new directory, such as `/timing/fast/std.lib` and `/timing/slow/std.lib`, will have duplicate names of “`std.lib`”. The duplicate names are not supported and will cause an error. You can use the `read_db` command to update all the LEF full-path names or use a new MMMC files with all the new `.lib` full-path names if duplicate file names need to be updated. If there are missing library file names, the tool will show an error.

The `relink_db_files` command supports `.lib`, `.lef`, and `qrcTechFile` library file types.

Parameters

<code>-help</code>	Prints a brief description that includes the type and default information for each <code>relink_db_files</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man relink_db_files</code>
<code>-db_dir db_directory</code>	The current db directory which contains incorrect library symbolic links.
<code>-new_lib_dirs</code> <code>{new_lib_directory1 new_lib_directory2 ...}</code>	The new directories to search for library files.

Example

If the current LEF files are all under `/libs/lefs_v1.0/` (or sub-directories) and the current `.lib` and `qrcTechFiles` are all under `/libs/timing_v1.0/` (or sub-directories), you use the following command to update the LEF files to use `/libs/lefs_v2.0/`:

```
>relink_db_files -db_dir my_db -new_lib_dirs {/libs/lefs_v2.0 /libs/timing_v1.0}
```

Note: The command must find every library file. Therefore, you need to list the top of the old timing directory tree along with the top of the new LEF files directory tree.

Related Information

- `write_db`
- `read_db`

set_cell_power_domain

```
set_cell_power_domain
[-help]
[-reset]
[-file file_name]
```

Defines domains for multi-VDD and multi-VSS cells. When reading an instance ASCII power file to perform power-rail analysis, if there are missing power values associated with ground pins, the software uses the information specified with the `set_cell_power_domain` command to derive domain association and distributes power to each ground net accordingly.

This domain information is stored in a side file that is used by power analysis to calculate power using the correct voltage for each domain. If you are specifying an external instance ASCII power file with pin information, this domain information is used to correctly distribute power to each pin.

Use this command before performing power and rail analysis.

Parameters

<code>-file file_name</code>	
	Specifies the name of the file containing the cell names and corresponding power-ground pairs. The format of the file is: <pre>CELL: <cell name1> <power1> <gnd1> <power2> <gnd2> CELL: <cell name2> <power1> <gnd1> ...</pre>
<code>-help</code>	Outputs a brief description for the <code>set_cell_power_domain</code> parameter. For a detailed description of the command, use the <code>man</code> command: <code>man set_cell_power_domain</code>.
<code>-reset</code>	Resets all specified options back to default values.

Examples

- The following command define two domains, VDD:VSS at 1v and VDDm:VSSm at 0.84v, of the cell

mycell in the file domain_file:

```
set_cell_power_domain -file domain_file
```

set_library_unit

```
set_library_unit
[-help]
[-cap capUnit]
[-time timeUnit]
```

Sets the time and capacitance unit values for constraints and report generation.

The timing constraints (SDC) files do not contain any unit specification for capacitance and time values. Hence, the units for these values are considered to be same as those specified in the timing libraries. The commands, e.g., `report_timing`, require consistent units to generate reports. If an inconsistency occurs in the timing libraries, the default unit of time (as ns) and capacitance (as pf) is used.

You can use this command when you need to override the library units, or force the setting of units when libraries have different units.

Note: You must set the `set_library_unit` command before the design and constraints are read.

Parameters

<code>-help</code>	Prints a brief description that includes the type and default information for each <code>set_library_unit</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man set_library_unit</code>.
<code>-cap capUnit</code>	Specifies the capacitance load unit in the timing library. <i>Default:</i> 1.0 pf
<code>-time timeUnit</code>	Specifies the time unit to be used for timing constraints. The valid values are 1ns, 1ps, 10ps, 100ps. <i>Default:</i> 1.0 ns

Example

- The following command sets the time unit for the design to 10ps:

```
set_library_unit -time 10ps
```

set_power_def_files

```
set_power_def_files fileNameList  
[-die_instance dieinstname]
```

Specify the name of the DEF file(s). This command can be used in lieu of `read_def` command for analysis purpose. When you use the `set_power_def_files` command, the software passes specified DEF files to the power and rail analysis programs for internal processing without loading their physical data in memory. As a result, you will not be able to display and query layout of the design. These programs will only process the necessary data from DEF file(s). The usage of this command is recommended in dynamic power analysis, and static and dynamic rail analysis for large (>5M components) designs with hierarchical DEFs or in general to obtain better performance during analysis. You will be able to save memory and runtime that takes to load design during analysis. Once the analysis is complete, you can subsequently load DEFs in the same or new session using the `read_def` command to view design layout and analysis results.

Note that for MSMV design, in order to use `set_power_def_files`, static power analysis mode will require CPF (Common Power Fomat) that defines logical connectivity of the instances to power nets. If CPF is not available, you can optionally run dynamic power analysis which calculates dynamic as well as static power.

<code>-die_instance <i>dieinstname</i></code>	
	Specifies the die instance name for multi-die analysis. This option is only available in multi-die analysis.
<code><i>fileNameList</i></code>	List of DEF files.

set_power_lib_files

```
set_power_lib_files
[-help]
[<in_file <file1[<file2] ...>>] [-reset]
```

Specify the name of the timing library file(s) for dynamic power analysis. This command allows you to run the dynamic power analysis flow without reading a dotlib into design database to reduce background memory consumption. You must have an external TWF file to run this flow as the timing engine will not be invoked from within the software. This flow is recommended for large designs where front-end processing of timing libraries is high. Some of the database query commands will not work if `set_power_lib_files` is used.

This command works in conjunction with the `specify_def` and `specify_spef` commands.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>set_power_lib_files</code> parameter.
<i>in_file</i> <file1[<file2] ...>	
	List of timing library files.
-reset	Resets all specified options back to default values.

Examples

- The following Tcl shows the use model of the **set_power_lib_files** command that works in conjunction with the `specify_def/specify_spef` flow to perform dynamic power analysis:

```
read_lib -lef tech1.lef tech2.lef
set_power_lib_files ../library1.lib ../library2.lib
specify_def adder_routed.def
specify_spef {test.spef }
read_twf test.twf2
read_verilog test2.v
set_top_module test
set_default_switching_activity -comb_clockgate_ratio 1 -period 2.01ns -input_activity
0.2 -icg_ratio 1
report_power
```

write_db

```
write_db
[-help]
[-keep_partial]
[-no_timing_graph]
[-overwrite]
{{out_dir [[-def ] [-common ]]} | {-oa_lib_cell_view {libname cellname viewname} }}
[-no_rc]
[-lib]
[-user_path]]
```

Saves the files for design import, floorplan, placement, routing, and power switch state information in the specified directory. You can save a design to the same location from which you restored the design. The new data, including the netlist and constraints, overwrite the previous data.

You can use the `write_db` command at any time after importing a design.

❗ Modifying the contents of the `filename.dat` directory created by `write_db` can cause major unexpected results. Never modify the directory contents.

To save a design in OpenAccess database format, use `write_db -oa_lib_cell_view {libname cellname viewname}`.

The `write_db` command saves a tool design in the portable mode by default. In this mode, the design and library data as well as Tempus control files do not have any path dependency. As a result, the saved database can be restored from any directory within the same network. The saved database can also be moved to any directory within the same network without any change. You can set the `write_db_portable` variable to `false` if you do not wish to save the design in portable mode.

The portable `write_db` feature is currently not supported for OpenAccess databases.

Note: The `write_db` command will issue an error message if you try to save a multiple-supply voltage (MSV) design in native format. Instead, create a Common Power Format (CPF) file containing CPF-based MSV commands and load the file, or use the following commands in this specific order to save your native MSV design in a CPF database:

1. `saveCPF`
2. `loadCPF`
3. `commitCPF`
4. `write_db`

For backward compatibility, if you must save the MSV design in a native database, set the following variable before saving the design:

`setVar dbgSaveOldMsvDBOnly`

Cadence does not recommend that you do this: use the `saveCPF`, `commitCPF`, `loadCPF`, `write_db` flow instead.

Note: The `write_db` command does not save the state of the `timing_enable_simultaneous_setup_hold_mode` timing attribute. When the attribute is set to true, various physical design functions in the system are disabled. When the design is restored (using the `read_db` command), the physical design commands are required to be active so that the system can be properly initialized.

Parameters

<code>-help</code>	Prints a brief description that includes the type and default information for each <code>write_db</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man write_db</code> .
<code>-common</code>	Saves the common-db design data to the specified directory.
<code>-def</code>	Saves a DEF file, in addition to saving place and route files when you save the design.
<code>-keep_partial</code>	Keeps the partially saved database for debugging purposes only, because restoring this database is not recommended. If the <code>write_db</code> command does not complete successfully, the session data will be removed by default.
<code>-oa_lib_cell_view {libname cellname viewname}</code>	Saves the design in OpenAccess database format using the specified library, cell and view names. The design is saved in the <code>libname/cellname/viewname</code> directory. Note: Usually, the cell name is the same as the design top cell name. If the cell name specified is different from the top cell name, it means that the top module created in OpenAccess would have the new cell name instead of the original name.
<code>out_dir</code>	Represents the user-defined name of the current Tempus session. The recommended file extension is <code>.enc</code> . The associated data directory is <code>dir_name.enc.dat</code> .

-lib	Resolves symlinks of timing library files and side files. When you specify <code>-lib</code> with <code>write_db</code> while saving a design in OpenAccess format, the links under <code>libname/libs</code> directory are replaced with real files. When you specify <code>-lib</code> with <code>write_db</code> while saving a design in Tempus format, the links under <code>filename.enc.dat/libs</code> directory are replaced with real files.
-no_rc	Does not write RC extraction data.
-no_timing_graph	Does not save timing graph information.
-overwrite	Overwrites the information.
-user_path	By default all external file references (such as. library files) are stored as absolute paths without any symbolic-links. So, the DB directory is portable anywhere on the same network. This option stores external file references exactly as you entered it For example, full paths like <code>/x/y</code> or relative paths like <code>../x/y</code>, <code>./x/y</code>), and keeps any symlinks used inside the path names. <i>Data_type</i>: bool, optional Example: Consider that there are two library files <code>a.lib</code> and <code>b.lib</code> under: <pre>/global/project1/libs/mmmmc</pre> And two lef files <code>c.lef</code> and <code>d.lef</code> under: <pre>/global/project1/libs/lef</pre> There are two symlinks to the libs: <pre>/usa/db1/libs1.0/mmmmc/a.lib → /global/project1/libs/mmmmc/a.lib</pre> <pre>/usa/libs/mmmmc/b.lib → /global/project1/libs/mmmmc/b.lib</pre>

```
t1/libs/mmmc/b.lib
```

And two symlinks to the lefs:

```
/usa/db1/libs1.0/lef/c.lef  
    → /global/project1/libs/lef/c.lef
```

```
/usa/libs/lef/d.lef          → /global/projec  
t1/libs/lef/d.lef
```

Your current work dir is /usa/db1.1/. You have an init script like:

```
read_mmmc ./mmmc.tcl  
  
read_physical -lefs {/usa/db1/libs1.0/lef/c.lef  
../libs/lef/d.lef}  
  
read_netlist design.v  
  
init_design
```

Where mmmc.tcl has:

```
create_library_set -name test -timing  
{/usa/db1/libs1.0/mmmc/a.lib ../libs/mmmc/b.lib  
}
```

Then after write_db, without -user_path, will save the libs and lefs to link to the real files.

```
> write_db db1.2
```

The ./mmmc.tcl file is always stored inside the DB dir, so no external reference is used.

By default, external file references are resolved to their fullpath name without any symlinks.

The .lib files inside the mmmc.tcl file will be referenced as: {/global/project1/libs/mmmc/a.lib

```
/global/project1/libs/mmmc/b.lib}
```

The .lef files will be referenced

as: {/global/project1/libs/lef/c.lef
/global/project1/libs/lef/d.lef}

This is portable and can be loaded by read_db anywhere on the same network.

```
/usa/db1.2/libs1.2/mmmc/a.lib    →  
/global/project1/libs/mmmc/a.lib
```

```
/usa/db1.2/libs1.2/mmmc/b.lib    →  
/global/project1/libs/mmmc/b.lib  
  
/usa/db1.2/libs1.2/lef/c.lef    →  
/global/project1/libs/lef/c.lef  
  
/usa/db1.2/libs1.2/lef/d.lef    → /global/proje  
ct1/libs/lef/d.lef
```

With `-user_path` will save the libs and lefs to keep the symlinks of the current db.

```
> write_db db1.2 -user_path
```

The .lib files will be referenced as entered by the user: {/usa/db1/libs1.0/mmmc/a.lib
../libs/mmmc/b.lib}

The .lef files will be referenced as entered by the user: {/usa/db1/libs1.0/lef/c.lef
../libs/lef/d.lef}

So `read_db` must be run in the same directory where `write_db` was run, or in a directory with the same `./y` and `/x` directory structure.

```
/usa/db1.2/libs1.2/mmmc/a.lib    →  
/usa/db1/libs1.0/mmmc/a.lib  
  
/usa/db1.2/libs1.2/mmmc/b.lib    → ../../../../libs  
/mmc/b.lib  
  
/usa/db1.2/libs1.2/lef/c.lef    → /usa/db1/libs  
1.0/lef/c.lef  
  
/usa/db1.2/libs1.2/lef/d.lef    → ../../../../libs  
/lef/d.lef
```

Example

- The following command copies the current design import configuration, floorplan, placement, and route files into directory `test.enc`:

```
write_db test.enc
```

Related Topics

- [read_db](#)
- [write_db](#) [Category](#) [Attributes](#)

write_db Category Attributes

The root attributes in the `write_db` category are:

- `write_db_create_read_file`
- `write_db_include_metal_fill_rules`

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `write_db` category, use the following command:

```
get_db -category write_db
```

write_db_create_read_file

```
write_db_create_read_file {true | false}
```

Default: false

Data_type: bool

When set to true, 'write_db my_db' will also create a 'my_db.read' file with a 'read_db my_db' command inside it. This is a Tcl file that can be passed to the Linux executable to make it easy to load the DB at startup like this:

```
'tempus -files my_db.read'.
```

For OA usage, it would have the appropriate 'read_db -oa_lib_cell_view {<lib><cell> <view>}' command inside it.

write_db_include_metal_fill_rules

```
write_db_include_metal_fill_rules {0 | 1}
```

Default: 0

Data_type: int

Specifies whether metal fill settings are to be saved in the .init file when saving the design. Metal fill settings include `set_metal_fill`, `set_metal_fill_spacing_table`, and `set_via_fill` settings. By default, these metal fill settings are lost when you exit Tempus. To enable Tempus to record metal fill settings in the .init file, you must set the `write_db_include_metal_fill_rules` to 1 before saving the design. You

can easily reload your settings by restoring the saved design:

```
set write_db_include_metal_fill_rules 1  
set_metal_fill -iterationName iter1 ...  
write_db  
read_db  
#The previous metal fill settings are reloaded.
```

Related Commands

- [write_db](#)
- [read_db](#)

write_def

```
write_def
[-help]
def_file
[-add_half_wire_extension_on_pin]
[-all_layers]
[-bump_as_pin]
[-cut_row]
[-flatten_via_pillar]
[-floorplan]
[-io_row]
[-netlist]
[-no_core_cells]
[-no_special_net]
[-no_std_cells]
[-no_tracks]
[-output_mask_layers layerNames]
[-scan_chain]
[-selected]
[-skip_trim_metal_layers]
[-trim_metal_gap_fill]
[-unit unit_per_micron]
[-unplaced]
[-used_via]
[-verilog_from_def_netlist_flow]
[-with_shield]
[-routing [-routing_to_special_net | -wrong_way_routing_to_special_net ]]
[-early_global_route]
```

Writes the specified information to a DEF file. By default, the `write_def` command writes floorplan, and all placed and unplaced standard cell information to the DEF file.

The `write_def` command does not support multiple groups per region. If you run Early Global Route before you run the `write_def` command, the software does not write information about `FIXED` status wires to the DEF file. The `write_def` command supports rectilinear die area.

By default, the `write_def` command does not write out any `NONDEFAULTRULE` or `VIA` defined in the LEF file. To write out a LEF via, set the `write_def_include_lef_vias` attribute to `true`. To write out a nondefault rule, set the `write_def_include_lef_ndr` attribute to `true`.

You can use the `write_def` command after importing a design.

Note: You can select the DEF version for your output file by setting the `write_def_lef_out_version` attribute to the version number. For example, to set the version number to 5.6, type the following command:

```
set_db write_def_lef_out_version 5.6
```

Parameters

<code>-help</code>	Prints a brief description that includes the type and default information for each <code>write_def</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man write_def.</code>
<code>-add_half_wire_extension_on_pin</code>	Typically, signal routing in the <code>NETS</code> section uses the default half-width wire extensions everywhere except for zero extensions on pins. This parameter forces the zero-extension on pins to the default half-width extension, and makes the DEF compatible for older tools that do not support DEF zero wire extensions. Note: Using this parameter can cause DRC violations.
<code>-all_layers</code>	Writes out any wires and shapes on non-routing layers to SPECIALNETS section.
<code>-bump_as_pin</code>	Writes bump cells as top-level pins in the <code>PINS</code> section. If a PORT in a block has a PASSIVATION layer, the tool treats it as an embedded bump. <code>write_def -bump_as_pin</code> outputs all the layer information for embedded bumps in the PIN section as for normal bumps. Use the <code>-bump_as_pin</code> parameter to generate a DEF file for use with Quantus gate-level extraction.
<code>-cut_row</code>	Cuts rows against placement obstructions, block halos, or power domain fence minimum gaps. <i>Default:</i> Placement blockages are written to the DEF file.
<code>def_file</code>	Specifies the DEF output file. If you add <code>.gz</code> as a suffix, the <code>write_def</code> command will automatically compress the generated file.

<code>-flatten_via_pillar</code>	Some advanced nodes that use SADP (self-aligned double patterning) use via-pillars. A via-pillar is a single via definition with two or more disjoint metal-shapes on the bottom (or top) routing layer of the via. This option will flatten the via pillar into several separate "normal" vias (e.g. a via with only a single metal shape on the top and bottom via layers). The multiple normal vias will be geometrically equivalent to the single via pillar. This can be useful for external tools that do not support a via pillar.
<code>-floorplan</code>	Writes the floorplan data to the DEF file. This information includes rows, chip size, <code>CLASS PAD</code> instances, <code>CLASS BLOCK</code> instances, and all placed standard cells.
<code>-io_row</code>	Generates I/O rows based on I/O pad placement, and writes the I/O row information to the DEF file.
<code>-netlist</code>	Writes the netlist (that is, the routing connectivity information) to the DEF file. This option is typically used after the design has been placed. Note: Use <code>-netlist</code> with <code>-unplaced</code> if the design has not been placed.
<code>-no_core_cells</code>	Excludes core cell information from the DEF file to reduce the data size for import into APD.
<code>-no_special_net</code>	Excludes special vias from the DEF file.
<code>-no_std_cells</code>	Excludes placed and unplaced standard cell information from the DEF file. Note: If you specify this parameter with the <code>-floorplan</code> or <code>-unplaced</code> parameters, it overrides their setting.
<code>-no_tracks</code>	Excludes output track and gcell statements to the DEF file.
<code>-output_mask_layers layerNames</code>	Outputs MASK data on specified layers only.

<code>-routing</code>	Writes the routing information to the <code>NETS</code> section of the DEF file. If the <code>-routing</code> option is not specified, both power and signal vias are not written to the DEF file. Note: The <code>-routing</code> parameter implies the <code>-netlist</code> parameter; therefore, if you specify this parameter, you do not need to specify <code>-netlist</code>.
<code>-routing_to_special_net</code>	Writes all regular NETS routing to the SPECIALNETS section.
<code>-scan_chain</code>	Writes scan chain information to the DEF file.
<code>-selected</code>	Writes out information for selected as follows: • If an instance or net is selected, writes only the DEF header and COMPONENT section for instances you have selected. If you specify the <code>-routing</code> parameter along with this parameter, the <code>write_def</code> command writes selected nets with their special routing and regular routing to the NETS section of the DEF file. • If a net is not selected but individual segments or vias are selected, writes only the selected vias to the DEF file. All LEF vias are excluded by default. If the <code>write_def_include_lef_vias</code> attribute is set to <code>true</code>, <code>write_def -selected</code> includes selected LEF vias when writing out selected vias. If the <code>-no_special_net</code> option is specified, special vias on the selected net will not be written out. • If a bump is selected, writes bump pin connection to the <code>SPECIALNETS</code> section of the DEF file. If a net is selected but bump pins are not individually selected, bump pin connection is not written. • If a blockage is selected in the main window, writes blockage information to the DEF file.
<code>-skip_trim_metal_layers</code>	Specifies to not write trimmetal shapes in the FILLS section.

<code>-early_global_route</code>	Writes information about the wires generated by Early Global Router to the <code>NETS</code> section of the DEF file. This option implies the <code>-routing</code> parameter; therefore, if you specify this parameter, you do not need to specify <code>-routing</code> .
<code>-trim_metal_gap_fill</code>	Writes trimmetal gap fills to a dummy net <code>_TRIMMETAL_FILLS_RESERVERD</code> in <code>SPECIALNETS</code> section.
<code>-unit <i>unit_per_micron</i></code>	Defines the units for the DEF file.
<code>-unplaced</code>	Writes information about unplaced standard cells to the DEF file.

<code>-used_via</code>	Specifies that only used vias should be written to the DEF file. Unused vias are ignored. All LEF vias are also excluded by default. To include used LEF vias in the DEF file, set the <code>write_def_include_lef_vias</code> attribute is set to <code>true</code> before specifying <code>write_def -used_via</code>. • If the <code>-routing</code> option is specified along with <code>-used_via</code>, used signal vias are also written out. • If the <code>-no_special_net</code> option is specified along with <code>-used_via</code>, used special vias are not written out. • If you specify both <code>-used_via</code> and <code>-selected</code>, the <code>-used_via</code> option is ignored and only selected vias are written to the DEF file. The following warning message is issued: **WARN: (ENCDF-1039): Option <code>-used_via</code> will be ignored because option <code>-selected</code> is specified. Only selected vias will be output. • If neither <code>-selected</code> nor <code>-used_via</code> is specified and the <code>write_def_include_lef_vias</code> attribute is set to <code>false</code> (default), all DEF vias are written out. • If neither <code>-selected</code> nor <code>-used_via</code> is specified and the <code>write_def_include_lef_vias</code> attribute is set to <code>true</code>, all DEF and LEF vias are written out.
<code>-verilog_from_def_netlist_flow</code>	
	Reconciles the names in the DEF and Verilog files generated by the <code>loadDefFile</code> command. The <code>loadDefFile</code> command generates a flat Verilog file in which all of the special characters are escaped. Use this parameter to convert the escaped names back to the original names in the DEF file.

<code>-with_shield</code>	By default, <code>write_def</code> does not write out the shielding routing on the power/ground net when outputting regular routing of selected nets in NETS section. When <code>-with_shield</code> is specified, <code>write_def</code> writes out those shielding routing (if any) on the power/ground net which is in the SPECIALNETS section. The <code>-with_shield</code> option must be used with the <code>-routing</code> and <code>-selected</code> options. Note: Multiple nets can be selected. If none of the selected nets have shielding routing, the <code>-with_shield</code> option has no effect.
<code>-wrong_way_routing_to_special_net</code>	Writes wrong way routing in the SPECIALNETS section.

Example

- The following command writes floorplanning data, and information on placed and unplaced standard cells to `TOPCHIP_SP.def`:
`write_def -floorplan -unplaced TOPCHIP_SP.def`
- The following command also writes floorplanning data, and information on placed and unplaced standard cells:
`write_def test.def`
- The following command writes floorplan and standard cell information to the DEF file. It does not write out unplaced standard cell information.

`write_def -floorplan`

- The following command excludes all information on placed and unplaced standard cells from the DEF file:

`write_def -floorplan -no_std_cells`

The resulting DEF file contains floorplan data only.

- The following command writes the shield wires that are shielding the selected nets to the DEF file:

`write_def -selected -routing -with_shield test.def`

- The following command writes bump cells as top-level pins in the PINS section of the `test.def` file:

`write_def -bump_as_pin test.def`

The PINS section in the `test.def` file is as follows:

```
+++++
PINS 102 ;

- iot_schm_2m16m_3v + NET iot_schm_2m16m_3v + DIRECTION OUTPUT + USE SIGNAL
+ SPECIAL + POLYGON ap ( 93300 65970 ) ( 65970 65970 )

```

Related Commands

- [write_def Category Attributes](#)

write_def Category Attributes

The root attribute in the write_def category is:

- `write_def_lef_out_version`

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `write_def` category, use the following command:

```
get_db -category write_def
```

write_def_lef_out_version

```
write_def_lef_out_version version_num
```

Default: 5.8

Data_type: enum {5.5 5.6 5.7 5.8 6.0}

Specifies LEF/DEF output version. Possible string values are 5.3, 5.4, 5.5, 5.6, 5.7, and 5.8. The default is 5.8.

write_mmmc

```
write_mmmc
```

```
[-help]
```

```
[-library]
```

Writes out the MMMC file.

Parameters

<code>-help</code>	Prints out the command usage.
<code>-library</code>	Writes out only the library part of the MMMC file.

Related Topic

- [read_mmc](#)

write_netlist Category Attributes

The root attributes in the write_netlist category are:

- [write_netlist_full_pin_out](#)
- [write_netlist_port_association_style](#)

To set the value of any root attribute, use the [set_db](#) command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the [get_db](#) command:

```
get_db attribute_name
```

To get the current value of all attributes in the `write_netlist` category, use the following command:

```
get_db -category write_netlist
```

write_netlist_full_pin_out

```
write_netlist_full_pin_out {true | false}
```

Default: false

Data_type: bool

Specifies whether to write out every instance port connection, including unconnected ports unused in the input netlist.

write_netlist_port_association_style

```
write_netlist_port_association_style {true | false}
```

Default: false

Data_type: bool

Writes out the netlist with implicit port mapping (that is, ordered port connections or position-based port connections) for hierarchical instances.

write_via_defs

```
write_via_defs  
[-help]  
[-generate]  
[out_file filename]  
[-all_vias | -signal | -all_rules | -default | -ndr ]
```

Helps in debugging and testing. All the boolean options are default to false. If none is set, the vias are dumped out in LEF format.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>write_via_defs</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man write_via_defs</code> .
-all_rules	Dumps out vias from all routing rules. this option is of type boolean.
-all_vias	Dumps out all vias. This option is of type boolean.
-generate	Dumps out auto-generated vias. This option is of type boolean.
-default	Dumps out vias of default routing rule. This option is of type boolean.
out_file filename	Specifies the output file name. This option is of type string. <i>Default:</i> <code>dump_via.out</code>
-ndr	Dumps out vias of nondefault routing rules. This option is of type boolean.
-signal	Dumps out signal vias. This option is of type boolean.

Example

The following command dumps out all signal vias to the default output file, `dump_via.out`:

```
write_via_defs -signal
```

Here's the sample output:

```
#### Begin signal vias ####
VIA V01 # LEF

check_design Category Attributes

The root attributes in the `check_design` category are:

- [check_design_across_hierarchy](#)
- [check_design_report_async_pins](#)
- [check_design_report_scan_pins](#)
- [check_design_threshold_fanout](#)

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `read_physical` category, use the following command:

```
get_db -category check_design
```

check_design_across_hierarchy

```
check_design_across_hierarchy {true | false}
```

Default: `true`

Data_type: `boolean`, `read/write`

Checks for undriven/multi-driven/unloaded/constant pins/ports by checking across hierarchical boundaries. By default checks are across hierarchy.

check_design_report_async_pins

```
check_design_report_async_pins {true | false}
```

Default: `true`

Data_type: `boolean`, `read/write`

Checks async pins in a netlist design.

check_design_report_scan_pins

```
check_design_report_scan_pins {true | false}
```

Default: `true`

Data_type: boolean, read/write

Checks scan pins in a netlist design.

check_design_threshold_fanout

`check_design_threshold_fanout threshold`

Default: 10000

Data_type: int, read/write

Checks for upper threshold in a netlist design.

switch_top_cell

`switch_top_cell`

`[-help]`

`[cellName]`

Switches the top cell to specify die name, and switches current tech lib to the relative die tech lib

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>switch_top_cell</code> parameter.
<code>cellName</code>	Specifies the top cell name.

connect

```
connect  
[-help]  
port|pin|hpin|hport|pg_pin+  
[-net net_object | -net_name net_name | -constant 0|1 | -hnet hnet_object ]
```

Connects objects together. If these object exist in different levels of hierarchies, hpins/hport will be created to make these connections.

If more than one object has a driver (i.e. has a net connected), it creates a multi driver situation. If only one object has a net, all other objects will be connected to that net. If no object has a net, a net will be created and they all will be connected to that net and the `-net_name` option provides a mechanism to optionally name the new net. Otherwise, a new net will be created using `n_<i>` convention. If the `-net` option is used (along with a net object), then all objects will be disconnected from their existing connection and connected to the new net. For local connections, it returns then hnet object pointer used to make the connection. For hierarchical connection, it returns the parent net object pointer.

 The `connect` command is a limited-access feature in this release. It is enabled by a variable specified using the `set_limited_access_feature` command. To use this feature, contact your Cadence representative to explain your usage requirements, and make sure this feature meets your needs before deploying it widely.

Parameters

<code>-help</code>	Outputs a brief description that includes the type and default information for each <code>connect</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man connect</code>
<code>port pin hpin hport pg_pin+</code>	List of objects to connect. Multiple pin/port objects are supported. Note that only object pointers like <code>hport:h1/hport1</code> are allowed, and simple names like <code>h1/hport1</code> are not allowed. All objects in the list will be connected together so if objects have existing drivers, then a multidriver situation can be created. <i>Data_type:</i> <code>port pin hpin hport pg_pin</code>+, required
<code>-constant 0 1</code>	Connect the object to a constant (0 or 1). This option will only work for <code>hpin pin hport port</code> objects. When specified, any existing net connections to the <i>objects</i> specified will be disconnected prior to connecting to the constant. It does not connect the objects together, but instead adds a constant to each separate object at the level of hierarchy where the object exists. If an <code>hpin</code> or a <code>pin</code> is connected to an <code>hnet</code> (e.g. is not dangling), the constant is added to the <code>hnet</code>, otherwise it is added directly to the <code>hpin pin</code>. If a constant is added to a <code>port hport</code>, it is always added to the <code>hnet</code> of the <code>port hport</code>. If there are existing drivers or constants attached to any net of the <code>hnets</code> mentioned above, an error message is given, but the connection is done anyway. <i>Data_type:</i> <code>bool</code>, optional
<code>-hnet hnet_object</code>	Specifies the <code>hnet</code> object to be used for the connections. It is mutually exclusive with <code>-net_name</code>, <code>-net</code>, and <code>-constant</code>. Additionally, the <code>-hnet</code> option can only be used to make a local connection (i.e. at the same level of hierarchy).

<code>-net net_object</code>	Net object to be used for the connections. The object will be connected to the hnet of the specified net at the same level of hierarchy as the object. If there is no hnet at the same level of hierarchy, hports/hpins will be created using the base_name of the net object. Also, when <code>-net</code> is specified, any existing net connections to the <i>objects</i> specified will be disconnected prior to connecting to this net (for example, equivalent to running disconnect on each object first). <i>Data_type</i>: (net), optional
<code>-net_name net_name</code>	Net name to create when only pins specified. Net name to create when only pins specified (i.e. when <code>-net</code> is not specified). This is the base_name of the net and will replace the name of all nets connected to the pins in the object list. If a hierarchical connection is being made the base_name will also be used to name any hports/hpins that are created. If <i>net_name</i> has any illegal chars, it will be automatically escaped. Thus <code>-name "i1/n2"</code> will result in <code>"i1\n2"</code> for the <code>.escaped_name</code>, since it uses DEF escaping semantics. This is equivalent to checking if <i>net_name</i> is a legal Verilog identifier, and if not, prepend <code>\</code> and add a trailing space to the internal Verilog name. <i>Data_type</i>: string, optional

Examples

The following command connects two pins with the given net name:

```
connect {pin:H1/I1/Y pin:H1/I3/A} -net_name H1/N1
```

Related Information

- [disconnect](#)

connect_hpin

```
connect_hpin
[-help]
-hinst moduleName
-net netName
[-no_new_hpins]
-pin_name hpinName
```

Attaches an hpin in the specified hinst (or top level design) to a net.

Parameters

-help	Outputs a brief description that includes the type and default information for each <code>connect_hpin</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man connect_hpin</code>
-hinst <i>hinstName</i>	Specifies the hinst to that has the hpin. To specify the top design, enter <code>`-'</code> .
- net <i>netName</i>	Specifies the name of the net.
- no_new_hpins	Prevents the creation of new hpins. If the hpin cannot connect to the net in a different hierarchy through existing hpins, the software displays an error message and the command stops running. Default: If you do not specify this parameter, the software creates new hpins as required to reach the net.
-pin_name <i>pinName</i>	Specifies the <code>base_name</code> of the hpin on the hinst.

Examples

- The `connect_hpin` command connects the hpin with `base_name` `p1` on hinst named `h1/h2` to the net `h1/h2/net3`:
`connect_hpin -hinst h1/h2 -pin_name p1 -net h1/h2/net3`

Related Topic

- [disconnect_hpin](#)

connect_pin

```
connect_pin  
[-hport portName]  
-inst instName  
-net netName  
[-no_new_port]  
-pin termName  
[-reference_pin refInstName refTermName]
```

Attaches a terminal to a net. If the terminal already connects to a different net, the software first detaches the terminal from the current net, then attaches it to the new net.

Note: Detaching a terminal that drives an output terminal of a module produces a Verilog violation at the output terminal if you use `disconnect_pin`. Instead, use `connect_pin` to attach the terminal to a new net. The `connect_pin` command automatically detaches the terminal from the net connecting to the output terminal, then attaches the terminal to the net you specify. This command also enables you to specify a hierarchical net name, in addition to a flat net name.

Parameters

<code>-inst instName</code>	Specifies the instance containing the terminal. If the instance name does not exist, the software displays an error message and the command stops.
<code>-net netName</code>	Specifies the name of the net to attach to the terminal. If the net name does not exist, Tempus displays an error message and the command stops.
<code>-no_new_port</code>	Prohibits Tempus from creating hierarchical ports when it attaches a terminal. If the terminal cannot connect to the net through existing ports, Tempus displays an error message and the command stops. <i>Default:</i> If you do not specify this parameter, Tempus creates hierarchical ports as needed.
<code>- reference_pin refInstName refTermName</code>	Specifies the pin <i>refPinName</i> on instance <i>refTermName</i> connected to the net that Tempus connects to the terminal. You cannot specify the <code>-port</code> parameter if you use this parameter.
<code>-hport portName</code>	Specifies the hierarchical port used to connect the terminal with the net. If you specify this parameter, the hierarchical port must exist in the module that contains the instance. The hierarchical port must connect to the net. This parameter lets you use a specific port to maintain the same netlist topology, which simplifies equivalence checking later in the design flow. You cannot specify the <code>-pin</code> parameter if you use this parameter. <i>Default:</i> If you do not specify this parameter, Tempus uses existing ports or creates new hierarchical ports as necessary to connect the terminal to the net.
<code>-pin termName</code>	Specifies the name of the terminal that Tempus connects to the specified net. If the terminal name does not exist, Tempus displays an error message and the command stops.

Examples

- The following command attaches terminal *in1* of instance *i1/i2/i3* to net *i1/i2/net26*:

```
connect_pin i1/i2/i3 in1 i1/i2/net26
```

If *i1/i2/i3* does not exist, or if *in1* is not a terminal of *i1/i2/i3*, or if *i1/i2/net26* does not exist, the software displays an error message and the command stops.

- The following command attaches terminal *in1* of instance *i1/i2/i3* to net *net27*, using hierarchical port *myPort*:

```
connect_pin i1/i2/i3 in2 net27 -port myPort
```

The `myPort` port must exist in the module definition for `i1/i2`, and `myPort` must already connect to `net27`. If this is not the case, the software displays an error message and the command stops.

- The following command attaches terminal `in3` on instance `i1/i2/i3` through existing ports to `net28`:

```
connect_pin -no_new_port i1/i2/i3 in3 net28
```

If ports do not exist, the software displays an error message and the command stops.

Related Topic

- [disconnect_pin](#)

create_hport

```
create_hport
[-help]
[-bus msb:lsb]
-direction {in out inout}
-name hport_name
[-parent module|hinst|design]
```

Create new hports and corresponding hpins for the parent object. It also implicitly creates hnet and net objects inside the parent object with the same name as the new hport. If the new hport is a bus, then the bus_bits objects are also created. The hnet object has no corresponding hnet or net object but is left dangling. It returns the newly created hport object pointer.

Parameters

-bus <i>msb:lsb</i>	Specifies the bit range for bus hports. You must separate the start and end IDs with a colon (:). If there is an existing bus (for example, 3:0) then additional bits can be added provided they are adjacent to the existing bits (7:4 for example). By default, the tool creates a scalar hport. <i>Data_type</i>: string, optional
-direction {in out inout}	Specifies the direction of the new port, in, out, inout. <i>Data_type</i>: enum, required
-help	Outputs a brief description that includes the type and default information for each <code>create_hport</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man create_hport</code>
-name <i>hport_name</i>	Specifies the name of the new hport. If this is the full hierarchical path, then the parent will be derived from the name (i.e. the parent name is the string before the last "/". In this case, the base_name of the new hport (i.e. the string after the last "/") should not have any special characters that require escaping. When the <code>-parent</code> option is used, then the name is the base_name of the new hport. If the name has any illegal chars, it will be automatically escaped. Therefore, <code>-name "hp1/2"</code> will result in <code>"hp1\2"</code> for the <code>.escaped_name</code>, since it uses DEF escaping semantics. This is equivalent to checking if <i>hport_name</i> is a legal Verilog identifier, and if not, prepend \ and add a trailing space to the internal Verilog name. <i>Data_type</i>: string, required

<code>-parent</code> <code>module hinst design</code>	Specifies the parent for the new hport. <i>Data_type:</i> (hinst design module), optional
--	--

Example

- The following command creates new scalar objects `hpin:CPU/H1/H1/P1`, `hport:CPU/H1/H1/P1`, and `hnet/net H1/H1/P1`.
`create_hport -name P1 -parent add -direction in`
- The following command creates a new 8-bit objects `hpin:H1/H2/BP1`, `hport:H1/H2/BP1`, and `hnet/net H1/H2/BP1`.
`create_hport -name BP1 -parent H1/H2 -bus 7:0`
- The following command creates new scalar objects `hpin:CPU/H1/H2/P2`, `hport:CPU/H1/H2/P2`, and `hnet/net H1/H1/P2`.
`create_hport -name H1/H2/P2 -direction out`
- The following commands add a single bit to an hport:
`get_db hports *data_in*`
`{hport:cpu/H1/data_in[3]} {hport:cpu/H1/data_in[2]} {hport:cpu/H1/data_in[1]}`
`{hport:cpu/H1/data_in[0]}`
`create_hport -parent H1 -name data_in -bus 4:4 -direction in`

create_module

```
create_module
[-help]
-name module_name
```

Create new hports and corresponding hpins for the parent object. It also implicitly creates hnet and net objects inside the parent object with the same name as the new hport. If the new hport is a bus, then the bus_bits objects are also created. The hnet object has no corresponding hnet or net object but is left dangling. It returns the newly created hport object pointer.

Parameters	
-help	Outputs a brief description that includes the type and default information for each create_module parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man create_module</code>
-name module_name	Specifies the name of the new module. If the name has any illegal chars, it will be automatically escaped. Therefore, -name "m1/m2" will result in "m1\ /m2" for the .escaped_name, since it uses DEF escaping semantics. This is equivalent to checking if hinst_name is a legal Verilog identifier, and if not, prepend \ and add a trailing space to the internal Verilog name. Data_type: string, required

Example

- The following command creates module:<design>/mod1.
create_module -name mod1
- The following command creates hinst:<design>/H1.
create_hinst -name H1 -module mod1
- The following command creates hpin:<design>/H1/in.
create_hport -name in -module mod1 -input
- The following command creates hpin:<design>/H1/out.
create_hport -name out -module mod1 -output

create_port

```
create_port
[-help]
[-bus msb:lsb]
-direction {in out inout}
-name port_name
```

Create new ports for a design object and returns the newly created port object pointer. It also implicitly creates hnet and net objects with the same name connected to the port.

Parameters

<pre>- bus <i>msb:lsb</i></pre>	Specifies the bit range for bus ports. You must separate the start and end IDs with a colon (:). If there is an existing bus (for example, 3:0) then additional bits can be added provided they are adjacent to the existing bits (7:4 for example). Default is to create a scalar port. <i>Data_type</i>: string, optional
<pre>-direction {in out inout}</pre>	Specifies the direction of the new port, in, out, inout. <i>Data_type</i>: enum, required
<pre>-help</pre>	Outputs a brief description that includes the type and default information for each <code>create_module</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man create_module</code>. <i>Data_type</i>:
<pre>-name <i>module_name</i></pre>	Specifies the name of the new port. If the name has any illegal chars, it will be automatically escaped. Therefore, <code>-name "p1/2"</code> will result in <code>"p1\2"</code> for the <code>.escaped_name</code>, since it uses DEF escaping semantics. This is equivalent to checking if <code>port_name</code> is a legal Verilog identifier, and if not, prepend \ and add a trailing space to the internal Verilog name. <i>Data_type</i>: string, required

Example

- The following command creates a new input scalar port called P1:
`create_port -name P1 -direction in`
- The following command creates a new 8-bit output port called BP1
`create_port -name BP1 -bus 7:0 -direction out`

delete_inst

```
delete_inst  
-inst list_of_instances  
[-module moduleName ]
```

Deletes an instance from a design. Tempus checks whether the instance is physical or logical and deletes the instance accordingly.

You can use wildcards (*?) to specify the instances you want the tool to delete.

Parameters

<code>-inst <i>list_of_instances</i></code>	Specifies the name of the instance to delete.
<code>-module <i>moduleName</i></code>	Specifies the name of the Verilog module.

Example

- The following command deletes instance `i1/i2`:

```
delete_inst i1/i2
```
- The following command deletes all instances whose names begin with `i`:

```
delete_inst i1/i*
```

Related Topic

- [update_inst](#)

disconnect

```
disconnect
[-help]
pin|hpin|port|hport|pg_pin+
[-keep_dangling_net]
```

Disconnects pins, ports, hports, or hpins from any hnet or net. For example, if A, B, and C are connected to net N , and you disconnect A, then B and C remain connected to N, but A is now left unconnected. For hpin/hport objects, they are disconnected only from the local hnet they are connected to. So, for an hpin, it will be disconnected from the hnet above the hpin (outside the hinst of the hpin). For hports, it will be disconnected from the hnet below the hport (the hnet inside the hinst of the hport) but the associated hpin/hport to hnet connection is not affected. You need to disconnect them both if you want both connections removed. Also, if an hpin/pin is directly connected to a constant (e.g. has .constant 0/1 and no hnet), the .constant attribute on the hpin/pin will be cleared, and return “no_constant”.

By default, dangling hnets that have no port, hport, hpin, or pin attached to it are deleted. Any constants like 1'b0/1'b1 are ignored, so a constant hnet is considered dangling if there are no port, hport, hpin or pin objects attached to it.

 The `disconnect` command is a limited-access feature in this release. It is enabled by a variable specified using the `set_limited_access_feature` command. To use this feature, contact your Cadence representative to explain your usage requirements, and make sure this feature meets your needs before deploying it widely.

Parameters

<code>-help</code>	Outputs a brief description that includes the type and default information for each <code>disconnect</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man disconnect</code>
<code>-keep_dangling_net</code>	Keeps the net object even if it has no loads or drivers. Default is to delete dangling nets. <i>Data_type</i>: bool, optional
<code>pin hpin port hport pg_pin+</code>	List of objects to disconnect (port/pin/hpin/hport/pg_pin). Only objects are supported, no simple names. <i>Data_type</i>: (pin hpin port hport pg_pin)+, required

Example

Consider the following example:

```
@tempus1>get_db hport:H1/B1 .hnet
```

```
hnet:H1/B1
```

```
@tempus2>get_db hpin:H1/B1.hnet
```

```
hnet:P1
```

If the following command is run, the tool will disconnect hport:H1/B1 from hnet:H1/B1, but leave hpin:H1/B1 connected to hnet:P1

```
@tempus2>disconnect hport:H1/B1
```

disconnect_hpin

```
disconnect_hpin
[-help]
-hinst hinstName
-pin_name portName
```

Detaches the net connected to the specified port on the specified instance.

Parameters

-help	Outputs a brief description that includes the type and default information for each disconnect_hpin parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man disconnect_hpin</code>
-hinst <i>hinstName</i>	Specifies the name of the hierarchical instance.
- pin_name <i>portName</i>	Specifies the port on the module.

Example

- The following command detaches port `p1` from `moduleA`:
`disconnect_hpin moduleA p1`

Related Topic

- [connect_hpin](#)

disconnect_pin

```
disconnect_pin  
-inst instName  
[-net netName]  
-pin terminalName
```

Disconnects a terminal from a net.

Note: Detaching a terminal that drives an output terminal of a module produces a Verilog violation at the output terminal if you use `disconnect_pin`. Instead, use `connect_pin` to attach the terminal to a new net. The `connect_pin` command automatically detaches the terminal from the net connecting to the output terminal, then attaches the terminal to the net you specify.

Parameters

-inst <i>instName</i>	Specifies the instance that contains the terminal you want to detach.
-net <i>netName</i>	Specifies the net that is already connected to the terminal. If the terminal does not connect to the specified net, or if the net does not exist, the software displays an error message and the command stops. The software uses this parameter for error checking only.
-pin <i>terminalName</i>	Specifies the terminal to disconnect. If the terminal does not exist on the specified instance, the software displays an error message and the command stops.

Example

- The following command disconnects terminal `in1` of instance `i1/i2/i3`:

```
disconnect_pin i1/i2/i3 in1 i1/i2/net26
```

If instance `i1/i2/i3` does not exist, or terminal `in1` is not a terminal of `i1/i2/i3`, the software displays an error message and the command stops. The net `i1/i2/net26` is specified, so if net `i1/i2/net26` does not exist, or if the terminal is not already connected to net `i1/i2/net26`, the software displays an error message and the command stops.

Related Topic

- [connect_pin](#)

gui_show_buffer_tree

```
gui_show_buffer_tree  
-net netName  
[-out_file fileName]
```

Displays a buffer tree associated with the specified net.

Parameters

-net <i>netName</i>	Specifies the name of the net for which you want to display the buffer tree.
-out_file <i>fileName</i>	Specifies the text file containing buffer locations.

Example

- The following command highlights instances and wires in the buffer tree associated with the net `reset` in the design display area:

```
gui_show_buffer_tree -net reset
```

update_inst

```
update_inst  
[-help]  
-base_cell base_cell  
[-dont_snap_to_placement_grid]  
[-location {x y}] -name inst_name  
[-orient {r0 r90 r180 r270 mx mx90 my my90}]  
[-place_status {fixed soft_fixed placed unplaced cover}]
```

Updates the base cell of an existing instance object and returns the updated inst object pointer. The new base cell and existing base cell must have the identical pins.

Parameters

<code>-help</code>	Outputs a brief description that includes the type and default information for each <code>update_inst</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man update_inst</code>
<code>-base_cell base_cell</code>	Specifies the base cell to use for the new instance. <i>Data_type:</i> (base_cell), required)
<code>-dont_snap_to_placement_grid</code>	If <code>-dont_snap_to_placement_grid</code> is specified, the tool places the instance at the specified location even if the location is off the placement grid. This parameter is used with <code>-location</code>. <i>Default:</i> false <i>Data_type:</i> bool, optional
<code>-name instName</code>	Specifies the name of the instance to update. <i>Data_type:</i> (inst), required
<code>-location {x y}</code>	Specifies the location of the changed instance. <i>Default:</i> Default is the same location. <i>Data_type:</i> point, optional
<code>-orient {r0 r90 r180 r270 mx mx90 my my90}</code>	Specifies orientation of the changed instance. <i>Default:</i> Default is the same orientation. <i>Data_type:</i> enum, optional
<code>-place_status {fixed soft_fixed placed unplaced cover}</code>	Specifies the placement status of the changed instance. <i>Default:</i> Default is the same place_status. <i>Data_type:</i> enum, optional

Example

- The following command updates the `base_cell` of `inst i1/i2` from `BUF2` to `BUF4`, and then marks it as fixed:

```
update_inst -name i1/i2 -base_cell BUF4 -place_status fixed
```

add_pg_netlist_power_intent

```
add_pg_netlist_power_intent  
[-help]  
[-default_net string]
```

Initiates power intent inferencing after loading the design with the template view definition file. This command creates an individual power domain for each power net, similar to the SMSC PGV flow. It also updates the view definition file and `delay_corners` with the power domain information. This command creates library sets for each power domain based on PVT. Power domain PVT is inferred based on the voltage from the associated power net of the domain, and the process and temperature of design-level

PVT for the corner.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>add_pg_netlist_power_intent</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man add_pg_netlist_power_intent</code>
<code>- default_net string</code>	Specifies the default power net.

check_power_domains

```
check_power_domains
[-help]
[-all_inst_in_power_domain]
[-always_on_bias]
[-always_on_buffer_type]
[-antenna_diode {fileName ...}]
[-cell_bind {cell ...}]
[-drc_file string]
[-lib_binding_voltage]
[-lib_cell_binding]
[-global_connection [module_name_list]]
[-nets_missing_iso [fileName]]
[-ignore_net_to_port_iso]
[-ignore_net_to_port_shifter]
[-place [-place_report report_name]]
[-power_switch]
[-power_within_min_gap]
[-retention {fileName ...}]
[-nets_missing_shifter [fileName] [-ignore_net_to_port_shifter]]
```

Verifies whether the power domains are set up correctly in terms of timing library binding and PG connection. This command also checks whether any power domains overlap. The `check_power_domains` command checks that libraries specified for each power domain of each `dc_corner` are complete for each power domain member list.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>check_power_domains</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man check_power_domains</code> .
-all_inst_in_power_domain	Verifies all instances are in the power domain.
-always_on_bias	Checks the <code>always_on_bias</code> net connection.

- always_on_buf fer_type	Checks if the AO buffer in each domain has correct type in terms of AO Nwell design and IEEE1801 Nwell specification. <i>Data_type</i> : bool, optional
-antenna_diode { <i>fileName ...</i> }	
	Verifies antenna diode-related low power violations for the specified file.
-cell_bind { <i>cell ...</i> }	Checks against all views and power domains if binding exists in the list of specified cells.
- drc_file <i>file Name</i>	Creates the Design Rule Checking (DRC) violation markers and save those in the specified file.
- lib_binding_v oltage	Checks voltage against the binding library.
- lib_cell_bind ing	Verifies that all cells are bound to correct timing library cells.
-global_connection <i>module_name_list</i>	
	Verifies that power and ground pins of instances within the power domain are connected to the power and ground nets of that power domain. In addition, this parameter verifies that the tie-high and tie-low connections of an instance are connected to the same power and ground nets of the power domain to which the cell belongs. If you do not specify a list of module names, all modules are verified.
- nets_missing_ iso	Verifies if the nets are missing isolation instances according to the power intent file. It also checks if the isolation uses right type of cell specified in the IEEE1801 map_isolation_cell command (if any).
- ignore_net_to _port_iso	Ignores the nets connecting to I/O when verifying isolation using - nets_missing_iso.
- ignore_net_to _port_shifter	Ignores the nets connecting to I/O when verifying shifter using - nets_missing_shifter.
-place	Verifies if the instances are placed in the boundary of their power domain.
-place_report <i>report_name</i>	

	Specifies a name and location for the report generated when you use this command with the <code>-place</code> parameter.
<code>-power_switch</code>	Verifies whether each row in the power domains contain at least one power switch. The command issues a warning message detailing which rows do not contain at least one switch. It also checks if the power switch uses right type of cell specified in the IEEE1801 <code>map_power_switch_cell</code> command (if any).
<code>-power_within_min_gap</code>	
	Verifies that the power domain ring is within the distance specified by the <code>update_power_domain -gap_sides</code> command parameter.
<code>-retention {fileName ...}</code>	
	Specifies a name for storing the verify retention information. It checks if the retention uses the right type of cell specified in the IEEE1801 <code>map_retention_cell</code> command (if any).
<code>-nets_missing_shifter</code>	Verifies if the nets are missing level shifter according to the power intent file. It also checks if the level shifter uses right type of cell specified in the IEEE1801 <code>map_level_shifter_cell</code> command (if any).

Examples

The following command issues warning messages if instances that are not members of a power domain are placed within that power domain boundary, or if any power domains overlap:

```
check_power_domains -place
```

Related Commands

- `report_power_domains`
- `update_power_domain`

clone_msv_gate

```
clone_msv_gate  
[-iso]  
[-shifter]  
[-instances inst1 inst2 .... ]  
[-max_fanout integer]  
[-max_transition num]  
[-max_cap num]  
[-honor_pre_placed]  
[-honor_dont_touch]
```

Ensures that the cloned isolation or level shifter can drive a group of the receivers and be placed close to this group of receivers. By doing this, the timing QoR can be improved.

Note: The command will not automatically update your CPF file to match the new netlist. It is advised that you run Conformal Low Power to check for any issues. When the enable signal for isolation cells is cloned (creating new ports on the boundary of the power domain) the users may need to update the `create_isolation_rule` in CPF by defining the isolation control differently.

Parameters

<code>-honor_dont_touch</code>	Does not clone don't touch instances or cells. The default is to clone don't touch instances.
<code>-honor_pre_placed</code>	Does not clone pre-placed (fixed) instances. The default is to clone fixed instances
<code>-instances <i>inst1 inst2 ...</i></code>	Clones specified instances.
<code>-max_fanout <i>integer</i></code>	Specifies the maximum fanout count.
<code>-iso</code>	Clones isolation cells.
<code>-max_cap <i>num</i></code>	An optional check to clone instances with maximum capacitance violation. The default is not to use <code>-max_cap</code> violation.
<code>-max_transition <i>num</i></code>	Cloning will be only on instances with maximum transition time violation. The default is <code>2ns</code> .
<code>-shifter</code>	Clones level shifters.

commit_power_intent

```
commit_power_intent
[-help]
[-verbose]
```

Commits power intent specifications loaded in the session using the `read_power_intent` command(s) to be used in the verification and implementation of the structure and behavior of the design in context of a given power management architecture. The method supports incremental refinement of power intent specifications required for IP-based design flows.

Note: The `commit_power_intent` command needs to be run after all the `read_power_intent` command(s) have been issued in the flow.

Parameters

-help	Prints a brief description that includes type and default information for each <code>commit_power_intent</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man commit_power_intent</code>
-verbose	Prints the detailed information related to the <code>commit_power_intent</code> command.

Related Commands

- `delete_power_intent`
- `read_power_intent`

cut_power_domain_by_overlaps

```
cut_power_domain_by_overlaps
power_domain_name
[-help]
```

Stylus Common UI does not support the overlapped power domains. When you want to floorplan one power domain (inner domain) completely inside the other power domain (outer domain), use this command to cut the outer domain as a hollow or donut shape.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>cut_power_domain_by_overlaps</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man cut_power_domain_by_overlaps</code>
<i>power_domain_name</i>	Specifies the outer power domain where the nested power domain will reside.

delete_power_intent

```
delete_power_intent  
[-help]  
[-keep_fence]
```

The command deletes all the power intent data stored by the `commit_power_intent` command in current session and cleans up the design.

Parameters

-help	Prints a brief description that includes the type and default information for each <code>delete_power_intent</code> parameter. For a detailed description of the command and all its parameters, use the <code>man</code> command: <code>man delete_power_intent</code>
-keep_fence	Retains domain groups and their fences at the time of removing the LP database for completing non-LP status of applications. After completing the non-LP status of the required applications, use <code>read_power_intent</code> and <code>commit_power_intent -keep_rows</code> to restore the retained domain groups and domain fences of the removed LP database.

Related Commands

- `commit_power_intent`
- `read_power_intent`
- `write_power_intent`

get_cpf_user_attributes

```
get_cpf_user_attributes  
[-help]  
-domain domainName | -net netName
```

Reports the `user_attributes` of the power domain or net specified in the CPF file. If the domain or net has no `user_attributes` in the CPF file, then this command reports an empty string.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>get_cpf_user_attributes</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man get_cpf_user_attributes</code>
-domain	Specifies the name of the power domain containing the <code>user_attributes</code> .
-net	Specifies the name of the net having the <code>user_attributes</code> .

power_intent Category Attributes

The root attributes in the `power_intent` category are:

- `handle_old_lib_with_signal_level`
- `power_intent_allow_back_to_back_isolation`
- `power_intent_allow_nested_default_domain`
- `power_intent_allow_power_domain_min_gap_zero`
- `power_intent_allow_shifter_voltage_mismatch`
- `power_intent_assume_iso_enable_pin_is_always_on`
- `power_intent_check_all_nets_for_domain_crossing`
- `power_intent_do_not_use_top_domain_for_port_voltage`
- `power_intent_honor_power_domain_for_domain_crossing_route`
- `power_intent_honor_power_domain_for_intra_domain_route`
- `power_intent_include_dot_lib_related_pg_pin`
- `power_intent_use_cpf_global_connect_for_always_on_buffer`
- `power_intent_use_cpf_global_connect_for_shifter`
- `power_intent_use_effective_domain_for_iso_shifter_insertion`

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `power_intent` category, use the following command:

```
get_db -category power_intent
```

handle_old_lib_with_signal_level

```
handle_old_lib_with_signal_level {true | false}
```

Default: false

Data_type: Boolean

Allows using the old-style `.lib` with `signal_level` and `power_rail` in the MSV cell identification and term voltage.

power_intent_allow_back_to_back_isolation

`power_intent_allow_back_to_back_isolation {true | false}`

Default: false

Data_type: Boolean

Supports back-to-back isolation insertion along one cross-domain net based on the CPF ISO rule. Set true to enable.

power_intent_allow_nested_default_domain

`power_intent_allow_nested_default_domain {true | false}`

Default: true

Data_type: Boolean

Allows a non-default power domain member to be logically nested in a default power domain. This default power domain member has fence constraint.

By default, due to grouping, the fence constraint is lost for the non-default power domain member. Set true to enable.

In the netlist: modules HInst11 and HInst12 are under HInst1; and HInst1 is under the top.

You have the following:

```
create_power_domain -instances HInst1
create_power_domain -default -instances {HInst11 HInst12}...
```

That means `HInst11` and `HInst12` are cut from `HInst1` to default power domain. If there is a fence/region constraint for `HInst11` and `HInst12` in default power domain, then please turn this global on. Otherwise, the fence/region for `HInst11` and `HInst12` will be lost.

power_intent_allow_power_domain_min_gap_zero

```
power_intent_allow_power_domain_min_gap_zero {true | false}
```

Default: `true`

Data_type: Boolean

Allows users to set power domain zero `minGap`.

power_intent_allow_shifter_voltage_mismatch

```
power_intent_allow_shifter_voltage_mismatch {true | false}
```

Default: `true`

Data_type: Boolean

When set to `false`, it prevents insertion of level shifters by allowing voltage tolerance.

power_intent_assume_iso_enable_pin_is_always_on

```
power_intent_assume_iso_enable_pin_is_always_on {true | false}
```

Default: `true`

Data_type: Boolean

Insert ISO/LS for all the inter-domain nets using effective domain based on the CPF rules. Set `true` to enable.

power_intent_check_all_nets_for_domain_crossing

```
power_intent_check_all_nets_for_domain_crossing {true | false}
```

Default: `true`

Data_type: Boolean

Checks all the nets for domain crossings. Set `true` to enable.

power_intent_do_not_use_top_domain_for_port_voltage

```
power_intent_do_not_use_top_domain_for_port_voltage {true | false}
```

Default: false

Data_type: Boolean

Controls voltage using top fterm domain for IO pin voltage.

power_intent_honor_power_domain_for_domain_crossing_route

```
power_intent_honor_power_domain_for_domain_crossing_route {true | false}
```

Default: true

Data_type: Boolean

Routes nets belonging to more than one power domain so that the routing does not violate power domain boundaries, in addition to routing intra-power domain and global nets using the specifications of the power domains.

For example, when you specify `power_intent_honor_power_domain_for_domain_crossing_route true`, if a net belongs to power domains PD1 and PD3, but not PD2, Early Global Route routes the net without going over the PD2 power domain boundary.

power_intent_honor_power_domain_for_intra_domain_route

```
power_intent_honor_power_domain_for_intra_domain_route {true | false}
```

Default: true

Data_type: Boolean

Routes intra-power domain and global nets using the specifications of the power domains. If you specify `power_intent_honor_power_domain_for_intra_domain_route true`, Early Global Route routes intra-power domain nets only within their power domains. Global nets that do not connect with a power domain do not get routed through that power domain.

power_intent_include_dot_lib_related_pg_pin

```
power_intent_include_dot_lib_related_pg_pin {true | false}
```

Default: true

Data_type: Boolean

Honors library related PG pins. Set true to enable.

power_intent_use_cpf_global_connect_for_always_on_buffer

```
power_intent_use_cpf_global_connect_for_always_on_buffer {true | false}
```

Default: false

Data_type: Boolean

Honors connection pecs for AO buffer based on the CPF rules. Set `true` to enable.

power_intent_use_cpf_global_connect_for_shifter

```
power_intent_use_cpf_global_connect_for_shifter {true | false}
```

Default: false

Data_type: Boolean

Honors connection specs for shifters based on the CPF rules. Set `true` to enable.

power_intent_use_effective_domain_for_iso_shifter_insertion

```
power_intent_use_effective_domain_for_iso_shifter_insertion {true | false}
```

Default: true

Data_type: Boolean

Honors effective domains for ISO/LS insertions. Set `true` to enable.

read_power_intent

```
read_power_intent  
[-help]  
power_intent_file  
{-cpf | -1801 | -msv_db }
```

Reads-in power intent file and does syntax check. Multiple `read_power_intent` commands can be issued in the flow. This method supports incremental refinement of power intent specifications required for IP-based design flows.

Note: The `commit_power_intent` command needs to be run after all the `read_power_intent` command(s) have been issued in the flow.

Parameters

<code>-help</code>	Prints a brief description that includes type and default information for each <code>read_power_intent</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man read_power_intent</pre>
<code>power_intent_file</code>	Specifies the name of the power intent file to be read.
<code>-cpf</code>	Specifies that the CPF format power intent file will be used.
<code>-1801</code>	Specifies that the IEEE1801 format power intent file will be used.
<code>-msv_db</code>	Specifies that the IEEE1801 data format (<code>.cpfdb</code>) power intent file will be used. Note: <code>-msv_db</code> is for partition flow and must be read for power intent in partition implementation.

Related Commands

- `commit_power_intent`
- `delete_power_intent`
- `write_power_intent`

report_isolation

```
report_isolation  
[-help]  
[-highlight]  
[-out_file fileName]  
[-from powerDomain]  
[-to powerDomain]
```

Reports or shows the added isolation cells and instances.

Note: Use this command after you add isolation cells.

Parameters

-help	Outputs a brief description that includes type and default information for each report_isolation parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man report_isolation</code> .
-from	Reports all the isolation instances connected to the output pins of the power domain specified in <code>-from</code> option. <i>Default:</i> Reports all isolation cells.
-highlight	Highlights isolation instances in the main window.
-out_file fileName	Writes isolation cell and instance names to a report. <i>Default:</i> The software writes the report to a default file: <code>designName.isolation.rpt</code>
-to	Reports all the isolation instances connected to the input pins of the power domain specified in <code>-to</code> option. <i>Default:</i> Reports all isolation cells.

Examples

The following command highlights isolation cells and writes the cell names to `test.isolation.rpt`:

```
report_isolation -highlight -out_file test.isolation.rpt
```

#DomainName	CellName	InstanceName
PD1	lvl_in_pp_f1_pm_dh	sub_inst2/LIN
PD1	lvl_in_pp_f1_pm_dh	sub_inst2/LCLK

report_partition_boundary_ports

```
report_partition_boundary_ports  
-pins
```

The `report_partition_boundary_ports` command prints out the boundary pins' debug information in a log which shows how to assign the power domain for the partition pins.

This is useful when debugging CPF partitions as you get the information about how Tempus assigns the power domain for the partition boundary pins during debugging.

Parameters

<code>-pins</code>	Specifies a list of the partition pins. If wildcard <code>*</code> is specified, it means all partition pins.
--------------------	--

Example

Specify the partition pins(Hterm) you want to debug:

```
report_partition_boundary_ports "I2/d I2/clk"
```

After partition, the command looks for the following DBG info in the log file

DBG: deriving hterm I2/d power domain

DBG:

report_power_domains

```
report_power_domains
[-help]
[-bind_lib]
[-insts inst_name]
[-iso_inst]
[-modules {list_of_modules}]
[-nets net_name]
[-out_file outFile]
[-pg_nets]
[-pins]
[-power_domain powerDomainName [-check_pg_scope]]
[-power_domain_boundary_port string]
[-power_domain_coverage pd1 pd2]
[-shifter]
[-supply_crossing supp1 supp2]
[-verbose]
[-voltage]
```

Reports information about power domains. The report includes the following attributes:

- Power domain name
- Power domain bounding box
- Timing library
- Mingap
- RS extension
- Row type
- Row spacing

The command also reports whether the power domain is always on.

Parameters

-help	Outputs a brief description that includes type and default information for each report_power_domains parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man report_power_domains.</code>
-------	---

<code>-bind_lib</code>	Reports the timing libraries available for instance binding including voltage scaling. However, the actual libraries that are used by the AAE delay calculation might be a subset of the timing libraries reported by this command.
<code>-check_pg_scope</code>	Checks if there are any PG connections that cross UPF-defined scope. All PG connections for UPF scope should be at the boundary PG port. This parameter is used with the <code>-power_domain</code> parameter.
<code>-insts inst_name</code>	Reports the power domain-related information for the specified instance: the input, output, and power/ground connections.
<code>-iso_inst</code>	Reports all isolation cells in the power domain.
<code>-modules {list of modules}</code>	Checks whether the specified instances or hierarchical instances are in the power domain. <i>Default:</i> The software does not perform this check.
<code>-nets net_name</code>	Reports power domain-related information for the specified net: • The driver instance of the net and its power domain. • The receiver instances of the net and their power domains.
<code>-out_file outFile</code>	Specifies the name of the output file. <i>Default:</i> <code>designName-powerdomain.rpt</code>
<code>-pg_nets</code>	Reports all the power/ground nets in the power domain.
<code>-pins pin1, pin2 ...</code>	Lists the pins and the option is of type string. This option is optional.
<code>-power_domain powerDomainName</code>	Specifies the power domain whose attributes you want to report. <i>Default:</i> If you do not specify the power domain, this command report data about all power domains.
<code>- power_domain_boundary_port s tring</code>	Reports if the specified port name of the power domain boundary has an IEEE1801 constraint.
<code>-power_domain_coverage pd1 pd2</code>	Reports the coverage between two specified domains.
<code>-shifter</code>	Reports all shifters in the power domain.

<code>-supply_crossing supp1 supp2</code>	Reports if the two specified supplies have the on/off and low/high crossing.
<code>-verbose</code>	Prints out the detail information and is optional.
<code>-voltage</code>	Reports domain voltage.

Examples

report_shifters

```
report_shifters  
[-help]  
[-cell cellName]  
[-from powerDomainName]  
[-to powerDomainName]  
[-out_file fileName]  
[-highlight]
```

Reports the level shifters that have been read into or defined for the Tempus software.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>report_shifters</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man report_shifters.</code>
-cell	Reports shifters with the specified cell. <i>Default:</i> Reports all level shifters.
-from <i>powerDomainName</i>	Reports all the shifter instances connected to the output pins of the power domain specified in the <code>-from</code> option. <i>Default:</i> Reports all level shifters.
-highlight	Highlights placed level shifters.
-out_file <i>fileName</i>	Reports all instances in an output file. <i>Default:</i> The instances will be reported to a default output file <code>designName.shifter.rpt</code> . A warning message is printed to indicate a default output file is created.
-to <i>powerDomainName</i>	Reports shifter instances connected to the input pins of the power domain specified in the <code>-to</code> option. <i>Default:</i> Reports all level shifters.

Examples

- The following command reports all level shifters in design `chip`:

```
loadShifter -infile chip.vsf
addShifter
report_shifters
```

- The following command reports all level shifters in the `shifter` output file in highlighted mode:

```
report_shifters -highlight -out_file shifter.rpt
#DomainName      CellName      InstanceName
PD1      A2LVLUO_X1M_A12TH      sub_inst2/LIN
PD1      A2LVLUO_X1M_A12TH      sub_inst2/LCLK
PD1      A2LVLUO_X1M_A12TH      sub_inst2/LOUT
```

- The following command reports all level shifters in the `shifter_power` output file from the `AO` pin to the `PD1` pin:

```
report_shifters -from AO -to PD1 -out_file shifter_power.rpt
#DomainName      CellName      InstanceName
PD1      A2LVLUO_X1M_A12TH      sub_inst2/LIN
PD1      A2LVLUO_X1M_A12TH      sub_inst2/LCLK
```

- The following command reports all level shifters in the `shifter_cell` output file for the `A2LVLUO_X1M_A12TH` cell:

```
report_shifters -cell A2LVLUO_X1M_A12TH -out_file shifter_cell.rpt
#DomainName      CellName      InstanceName
PD1      A2LVLUO_X1M_A12TH      sub_inst2/LIN
PD1      A2LVLUO_X1M_A12TH      sub_inst2/LCLK
PD1      A2LVLUO_X1M_A12TH      sub_inst2/LOUT
```

report_voltage

```
report_voltage  
[-help]  
[-early]  
[-inst string]  
[-late]  
[-net string]  
[-pin string]  
[-quiet]  
[-view string]
```

This command reports the voltage for the net/pin (term)/inst in the specific view under a specific corner.

Parameters

-help	Outputs a brief description that includes the type and default information for each <code>report_voltage</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man report_voltage</code>
-early	Specifies that the voltage is reported in the early mode.
-inst <i>string</i>	Specifies the instance power domain voltage (PVT).
-late	Specifies that the voltage is reported in the late mode.
-net <i>string</i>	Specifies the net voltage (driver's pin voltage).
-pin <i>string</i>	Specifies the term voltage.
-quiet	Displays only the pin voltage-related information without other additional unnecessary information to avoid huge log size.
-view <i>string</i>	Specifies the analysis view.

Examples

- The following command specifies to display the derived voltage for the net, `n1`:

```
tempus> report_voltage -net n1

-> driving term: i1/Y, mode: late
=====
derived voltage = 0.9
0.9
```

- The following command specifies to display the net (driver's pin) voltage and its related information:

```
tempus> report_voltage -net n1 -quiet

0.9
```

- The following command specifies to display the term voltage reported in the late mode:

```
tempus> report_voltage -pin sub_inst2/in -late

-> hterm: sub_inst2/in, connected to net n5
-> net: n5, volt 0.9
=====
derived voltage = 0.9
0.9
```

- The following command specifies to display the term voltage reported in the early mode:

```
tempus> report_voltage -pin sub_inst2/in -early

-> hterm: sub_inst2/in, connected to net n5
-> net: n5, volt 1.1
=====
derived voltage = 1.1
1.1
```

set_lib_binding_by_voltage

```
set_lib_binding_by_voltage  
[-help]  
[-default_power_net string]  
[-process float]  
[-temperature float] -power_net_voltages {pwr_net1@volt1 pwr_net2@volt2 ...} | {-  
early_power_net_voltages {pwr_net1@volt1 pwr_net2@volt2 ...} -late_power_net_voltages  
{pwr_net1@volt1 pwr_net2@volt2 ...}} | {-data_early_power_net_voltages {pwr_net1@volt1  
pwr_net2@volt2 ...} -data_late_power_net_voltages {pwr_net1@volt1 pwr_net2@volt2 ...} -  
clock_early_power_net_voltages {pwr_net1@volt1 pwr_net2@volt2 ...} -  
clock_late_power_net_voltages {pwr_net1@volt1 pwr_net2@volt2 ...}}
```

Initiates auto-inferencing of power intent, library binding, and view definition. It also provides voltages for each power net in the design. Use this command to assert voltages for power rails. This command creates the view definition file for single corner analysis and assigns the operating voltage for each power domain accordingly. It also creates library sets for each power domain based on the assigned PVT and associates the corresponding library set for the power domains.

Parameters

<code>-help</code>	Outputs a brief description that includes type and default information for each <code>set_lib_binding_by_voltage</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man set_lib_binding_by_voltage</code>
<code>-clock_early_power_net_voltages {pwr_net1@volt1 pwr_net2@volt2 ...}</code>	Assigns power net voltage for early corner of the clock path.
<code>-clock_late_power_net_voltages {pwr_net1@volt1 pwr_net2@volt2 ...}</code>	Assigns power net voltage for late corner of the clock path.
<code>-data_early_power_net_voltages {pwr_net1@volt1 pwr_net2@volt2 ...}</code>	Assigns power net voltage for early corner of the data.
<code>-data_late_power_net_voltages {pwr_net1@volt1 pwr_net2@volt2 ...}</code>	Assigns power net voltage for late corner of the data.
<code>-default_power_net string</code>	Specifies the default power net.
<code>-early_power_net_voltages {pwr_net1@volt1 pwr_net2@volt2 ...}</code>	Assigns power net voltage for early corner.
<code>-late_power_net_voltages {pwr_net1@volt1 pwr_net2@volt2 ...}</code>	Assigns power net voltage for late corner.
<code>-power_net_voltages {pwr_net1@volt1 pwr_net2@volt2 ...}</code>	Assigns power net voltage.
<code>-process float</code>	Defines filtering condition for the timing library characterized process.
<code>-temperature float</code>	Defines filtering condition for timing library characterized temperature.

update_power_domain

```
update_power_domain
[-help]
power_domain_name
[-add_block_box string]
[-core_to_bottom valueInMicron]
[-core_to_left valueInMicron]
[-core_to_right valueInMicron]
[-core_to_top valueInMicron]
[-default_tech_site string]
[-disjoint_hinst_box_list string]
[-extra_row_pattern {row_pattern_site_name ...}]
[-first_row_site_index integer]
[-gap_sides {values}|-gap_edges {values}]
[-last_row_site_index integer]
[-power_extend_sides {values}|-power_extend_edges {values}]
[-row_flip {first second noflip auto}]
[-row_pattern_site site_name]
[-row_space_type {0 1 2}]
[-row_spacing float]
```

Renames a power domain or changes its structure.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>update_power_domain</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man update_power_domain</code> .
-add_block_box	Adds a hard block to the disjoint power domain. <code>-add_block_box</code> supports both rectangular and rectilinear macros.
-core_to_left valueInMicron	Specifies the row margin from left boundary.
-core_to_right valueInMicron	Specifies the row margin from right boundary.

<code>-core_to_top valueInMicron</code>	Specifies the row margin from top boundary.
<code>-core_to_bottom valueInMicron</code>	Specifies the row margin from bottom boundary.
<code>-default_tech_site string</code>	Specifies the default tech site for power domain.
<code>-disjoint_hinst_box_list</code>	Specifies a region for an Hinst. It is defined as an Hinst and Region pair.
<code>-extra_row_pattern {row_pattern_site_name ...}</code>	Specifies the ROWPATTERN site name for the specified power domain. You can also specify a list of ROWPATTERN sites with this parameter.  • The rows are created for the <i>specified</i> ROWPATTERN sites within the domain fence, if specified, from the domain fence bottom edge, as per the defined order and orientation of all sites. • The ROWPATTERN site needs to be defined in the LEF file. <i>Default: ""</i>
<code>- first_row_site_index integer</code>	Specifies the first row site index value.
<code>-last_row_site_index integer</code>	Specifies the last row site index value.
<code>-power_extend_edges</code>	Specifies the maximum search distance for power extension connections by domain edge in microns. You can specify the value per edge in clockwise order, starting with the vertical edge at the lower-left corner (smallest Y, and then smallest X).

<code>-gap_edges</code>	Specifies the minimum space value to other domain by power domain edge in microns. You can specify the value per edge in clockwise order, starting with the vertical edge at the lower-left corner (smallest Y, and then smallest X).
<code>-gap_sides T B L R</code>	Defines the distance, in microns, that must be reserved from the power domain boundary edges for power routing. You can specify four values, one for each edge.
<code>power_domain_name</code>	Specifies the current name of the power domain to be modified. This is a positional parameter, and you must specify this value immediately after the command name.

<pre>-row_flip {first second noFlip auto}</pre>	Flips the orientation of either the first or second row, then follows the flipped and abutted row pattern. <i>first</i> (from bottom to top). MX -> R0 -> MX -> R0 -> ... <i>second</i> (from bottom to top). R0 -> MX -> R0 -> MX -> ... <i>noFlip</i> (from bottom to top). R0 -> R0 -> R0 -> R0 -> ... The <i>noFlip</i> option preserves the R0 orientation for all rows (above). <i>auto</i> Detects orientation of row outside of power domain and aligns with power domain bottom. Orientation is applied to the first row at the bottom of power domain. So if row on left is R0, the pattern will be (from bottom to top). R0 -> MX -> R0 -> MX -> ... If row on left is MX, the pattern will be (from bottom to top). MX -> R0 -> MX -> R0 -> ... The <i>auto</i> option resets the software for this automatic behavior if you have previously specified <i>first</i>, <i>second</i>, or <i>noFlip</i>. Default: <i>auto</i> Note: <i>saveRowImage</i> resets the option – <i>row_flip</i> to <i>auto</i>. In this case, try moving the power domain and check the row changes.
<pre>-row_pattern_site <i>site_name</i></pre>	Specifies the site name for the row pattern.

<code>-row_spacing value</code>	Specifies the row spacing between each row (1) or each pair of rows (2) as specified in <code>-row_space_type</code> .
<code>-row_space_type {0 1 2}</code>	Determines whether the row spacing value applies between no row (0), each row (1), or each pair of rows (2).
<code>-power_extend_sides T B L R</code>	Specifies the boundary for legal targets to be used by the power planning and routing commands, in conjunction with the power domain boundary. You can specify four values, one for each edge.

Example

The following command changes the route search extension values of `PowerDomain1` to 15 μm on each side:

```
update_power_domain PowerDomain1 -power_extend_sides 15 15 15 15
```

Related Commands

- `report_power_domains`

write_power_intent

```
write_power_intent  
[-help]  
file_name  
incremental_1801  
{-cpf [[-hinsts -top_hier] | [-hinst_only]] | -1801}  
[-no_extra_connects]
```

Writes the CPF/IEEE1801 file. The command options help to write the file for CPF as well as for the IEEE1801 standard.

Parameters

-help	Prints a brief description that includes type and default information for each <code>write_power_intent</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man write_power_intent</code>
<i>file_name</i>	Specifies name of the IEEE1801 input file.
For CPF	
-cpf	When specified, Tempus writes out the CPF file.
-hinst_only	Specifies the hierarchical instance name. Writes (partitions) the CPF for the hierarchical instance specified in this option. Note: Must be used along with <code>-cpf</code> option.
-hinsts	Writes top-level CPF where the hierarchical instances specified in <code>-hinsts</code> option are hard blocks when specified together with <code>-top_hier -cpf</code> .
-top_hier	Writes top-level CPF when specified together with <code>-hinsts</code> and <code>-cpf</code> .
For IEEE1801	

-1801	Writes the IEEE1801 file from the low-power database. It filters out the non-existing instances from the original IEEE1801 file and appends to it the following: • PG connection for the newly-inserted always-on buffers • Nwell/Pwell connections for the low-power cells • <code>-no_isolation/shifter</code> for the isolation/level shifter strategies for the newly-created ports along the power domain boundary
-incremental_1801	Specifies the incremental IEEE1801 power intent.
-no_extra_connects	If this parameter is specified, <code>write_power_intent -1801</code> does not write out any extra <code>connect_supply_net</code> (PG connection). For example: <pre>write_power_intent -1801 -no_extra_connects out.upf</pre> Note: Extra connects means that the extra <code>connect_supply_net</code> commands appended by the tool, which are not included in the original UPF.

connect_net

```
connect_net  
[-help]  
net_name  
list_of_pins
```

Attaches nets to pins. The syntax is order-dependent.

After any ECO command, the tool performs either an incremental or full timing update when you run the next command that reports timing, for example, [report_timing](#).

Note: The tool supports this command for flattened designs only.

Parameters

<i>list_of_pins</i>	Specifies a list of pins/ports to attach to the specified net or nets.
<i>net_name</i>	Specifies the net to attach to the pins.

Examples

The following example attaches `net26` to pins `i1/A`, `i2/B`, and `i3/Z`.

```
tempus> connect_net net26 "i1/A i2/B i3/Z"
```

The following command is equivalent to the above example:

```
tempus> connect_net [get_nets net26] [get_cells "i1/A i2/B i3/Z"]
```

Related Commands

- `create_inst`
- `create_net`
- `connect_pin`
- `update_inst_name`
- `delete_inst`

- `disconnect_net`
- `disconnect_pin`

create_inst

```
create_inst  
[-help]  
[-dont_snap_to_placement_grid]  
[-location {x y}]  
[-orient {r0 r90 r180 r270 mx mx90 my my90}]  
[-physical] { -base_cell <base_cell> } { -name <inst_name> } [ -parent <module|hinst|design>  
] [ -place_status <place_status> ]
```

Adds an instance and places it in the design. The syntax is not order dependent.

After any ECO command, the tool performs either an incremental or full timing update when you run the next command that reports timing, for example, [report_timing](#).

Note: The software supports this command for flattened designs only.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>create_inst</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man create_inst</code> .
-base_cell <base_cell>	Specifies the <code>base_cell</code> to be used for the new instance.
-dont_snap_to_placement_grid	Places the instance at the location specified using the <code>-location</code> parameter even if the specified location is on or off the placement grid. By default, <code>create_inst</code> snaps the placement location to the placement grid. <i>Default:</i> <code>false</code>
-location {x y}	Specifies the location of the placed instance. <i>Default:</i> If you do not specify a location, the software places the instance at the design origin.

<code>-name <inst_name></code>	Specifies the name of the new instance. If this is the full hierarchical path, then the parent will be derived from the name (that is the parent name is the string before the last "/". In this case, the <code>base_name</code> of the new instance (that is the string after the last "/" should not have any special characters that require escaping. When the <code>-parent</code> parameter is used, then the name is the <code>base_name</code> of the new instance. If the name has any unknown characters, it will be automatically escaped. Thus <code>-name "i1/i2"</code> will result in <code>"i1\i2"</code> for the <code>.escaped_name</code>, since it uses DEF escaping semantics. This is equivalent to checking if <code><inst_name></code> is a legal Verilog identifier, and if not, prepend <code>\</code> and add a trailing space to the internal Verilog name.
<code>-orient {r0 r90 r180 r270 mx mx90 my my90}</code>	Specifies orientation of the placed instance. <i>Default:</i> <code>r0</code>
<code>-parent <module hinst design></code>	Specifies the parent for the new instance. This supports both the object or the name for the specified object types. Note: Only honored for logical instances and will be ignored when used with <code>-physical</code>.
<code>-physical</code>	Creates a physical instance without updating the netlist. This can only be used with a <code>base_cell</code> that does not have any <code>lib_cells</code>. Also, this results in the instance <code>.is_physical</code> attribute being set to <code>true</code>.

`-place_status`
`<unplaced|place|soft_fixed|fixed|cover>`

Specifies the placement status of the added instance during placement and optimization.

You can specify the following as the placement status:

- `fixed`: The status of the added instance is fixed. It has a location and cannot be moved by automatic tools, but can be moved using interactive commands.
- `placed`: The status of the added instance is placed. It has a location, and can be moved using automatic tools and interactive commands.
- `soft_fixed`: The status of the added instance is `soft_fixed`. It cannot be moved by global placement and can only be moved by the legalization step of detail placement
- `unplaced`: The status of the added instance is unplaced. It does not have a location.

Default: `unplaced`

Note: This parameter is used with the `-location` option. It should not be used along with the `-parent` parameter.

Examples

The following example creates two instances, `inst1` and `inst2`, of library cell `LIB/BUFX2`:

```
tempus> create_inst -insts "inst1 inst2" -cell [get_lib_cells LIB/BUFX2]
```

Related Commands

- `connect_net`
- `delete_inst`

create_hinst

```
create_hinst  
[-help]  
[-parent <module|hinst|design>] { -name <hinst_name> } { -module <module|design> }
```

Creates a new `hinst` object and returns the newly created object pointer.

Parameters

-help	Outputs a brief description that includes the type and default information for each <code>create_hinst</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man create_hinst</code>
-module <module>	Specifies the module to be used for the new <code>hinst</code> . The new <code>hinst</code> will have <code>hports/hpins</code> created based on the module ports as well as <code>hnets</code> of the same name.
-name <hinst_name>	Specifies the name of the module instance to add.
-parent <hinst module design>	Specifies the parent for the new <code>hinst</code> . It supports both the object or the name for the specified object types. Default is the current design.

Examples

- The following command adds a hierarchical instance `A/B/spare` of module type `spareModule` to the design, here `A/B` should be an existing hierarchical instance in the design:

```
create_hinst -cell spareModule -hinst A/B/spare
```

- The following commands create a new module `modA` with the instance `inst_modA` and its clone `inst_modA_clone`:

```
create_hinst -cell modA -hinst inst_modA  
create_hinst -cell modA -hinst inst_modA_clone
```

The resulting Verilog netlist would have:

```
module modA();  
endmodule  
modA inst_modA();
```

```
modA inst_modA_clone();
```

create_hnet

create_hnet

[-help]

[-bus <msb:lsb>] { -name <hnet_name> } [-parent <module|hinst|design>] [-power | -ground]

Creates a new `hnet` (and parent net) object and returns the newly created `hnet` object pointer.

Parameters

-help	Outputs a brief description that includes the type and default information for each <code>create_hnet</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man create_hnet</code>
-bus <msb:lsb>	Specifies the bit range for bus nets. By default, the software creates a scalar <code>hnet</code>.
-name <hnet_name>	Specifies the name of the new instance. If this is the full hierarchical path, then the parent will be derived from the name (that is the parent name is the string before the last "/". In this case, the <code>base_name</code> of the new instance (that is the string after the last "/" should not have any special characters that require escaping. When the <code>-parent</code> parameter is used, then the name is the <code>base_name</code> of the new instance. If the name has any unknown characters, it will be automatically escaped. Thus <code>-name "i1/i2"</code> will result in <code>"i1\i2"</code> for the <code>.escaped_name</code>, since it uses DEF escaping semantics. This is equivalent to checking if <code><inst_name></code> is a legal Verilog identifier, and if not, prepend <code>\</code> and add a trailing space to the internal Verilog name.
-ground	Creates a ground net.
-parent <module hinst design>	Specifies the parent for the new <code>hinst</code>. It supports both the object or the name for the specified object types. Default is the current design.
-power	Creates a power net.

Examples

```
CPU
|
+-----+
|               |
H1 (alu)        H2 (fsm)
|
+-----+
|               |
+ H1 (add)      H2 (mult)
```

- The following command creates a scalar top level net/hnet named `N1`
`create_hnet -name N1`
- The following command creates a 8-bit net/hnet named `H1/H1/B1`
`create_hnet -name B1 -bus 7:0 -parent module:add`
- The following command creates an 8-bit net/hnet named `H1/H1/B1`
`create_hnet -name B1 -bus 7:0 -parent H1/H1`

- `disconnect_pin`

create_net

```
create_net  
[-help]  
-module <string>  
-names <list_of_nets>
```

Adds a net to the design.

After any ECO command, the tool performs either an incremental or full timing update when you run the next command that reports timing, for example, [report_timing](#).

Note: The tool supports this command for flattened designs only.

Parameters

-help	Outputs a brief description that includes type and default information for each <code>create_net</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man create_net</code>
-module <string>	Adds the new net to the specified verilog module. If the module name contains special characters, you need to start the module name with a backslash '\' and end it with a space.
-names <list_of_nets>	Specifies the list of nets to be added. If the net name contains special characters, you need to start the part of the net name, which contains special characters, with a backslash '\' and end it with a space. Note: You must specify <code>-names</code> before you specify other parameters. The software issues an error message if you do not specify the <code>-names</code> first.

Examples

- The following command adds nets `n1`, `n2`, and `n3`:

```
tempus> create_net -names "n1 n2 n3"
```
- The following command adds net with base name `ant_net[1]` to module `H[1]`:

```
tempus> create_net -names {\ant_net[1] } -module {\H[1] }
```

Related Commands

delete_nets

```
delete_nets  
[-help]  
[-all <string>]  
-module <string>  
net
```

Logically deletes nets from a design. If a net is routed, wire segments associated with the net are also deleted.

You can use wildcards (*?) to specify the nets you want Tempus to delete.

Parameters

-all <string>	Deletes all nets from a design.
-module <string>	Deletes the net from the specified verilog module.
<i>net</i>	Specifies the list of nets to be deleted.

Example

- The following command deletes net1:
tempus> delete_nets net1
- The following command deletes all nets whose name begin with net1:
tempus> delete_nets net1*
- The following command deletes all nets from the design:
tempus> delete_nets -all
- The following command deletes the net with base name `ant_net[1]` from module `H[1]`:
tempus> delete_nets {\ant_net[1] } -module {\H[1] }

Related Commands

- [connect_net](#)
- [delete_inst](#)

delete_routes

```
delete_routes
[-help]
-net net*
```

Deletes physical wires, any vias connected to the wires, and violation markers associated with the wires.

Note: The `delete_routes` command deletes only those vias that are connected to wires.

Parameters

-help	Prints a brief description that includes type and default information for each <code>delete_routes</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <pre>man delete_routes</pre>
-net net*	Specifies the net or list of nets from which to delete wires. You can use wildcard values in this field. For example, if you specify <code>v*</code>, deletes wires from nets <code>VDD</code> and <code>VSS</code>. Note: The wires and vias that are shielding the nets specified with <code>delete_routes -net</code> are not deleted. <i>Data_type:</i> (net)*, mandatory

Examples

- The following command deletes the wires and vias belonging to the net `carry4`:

```
delete_routes -net carry4
```

Related Command

- `delete_nets`

disconnect_net

```
disconnect_net  
[-help]  
-net <net_name>  
{-pins <list_of_pins> | -all}
```

Disconnects a net and connects it to new pins or ports. The syntax is not order-dependent.

After any ECO command, the tool can perform either an incremental or full timing update when you run the next command that reports timing, for example, [report_timing](#).

Note: The tool supports this command for flattened designs only.

Parameters

-all	Detaches all terminals connected to the net. You cannot specify a pin/port list if you specify this parameter.
-net	Specifies the net to connect.
-pins	Specifies the pins/ports from which the specified net is to be detached.

Examples

- The following command detaches `net26` from pins `i1/A`, `i2/B`, and `i2/Z`:

```
tempus> disconnect_net -net net26 -pins "i1/A i2/B i3/Z"
```

- The following command is equivalent of above example.

```
tempus> disconnect_net -net [get_nets net26] -pins [get_cells "i1/A i2/B i3/Z"]
```

Related Commands

eco_add_repeater

```
eco_add_repeater
[-help]
[-name <string>]
[-new_net_name <string>]
[-relative_distance_to_sink <float>]
[-spread_count <integer>]
[-spread_distance <float>]
[-spread_prefix <string>]
{-net <string> | -pins <string>} [-location {{x1 y1} {x2 y2}...} [-buffer_orient <string>]]
[-sort_by {slack trans area} [-max_cells <integer>]] [-cells <string> [-evaluate_only ]] [-
evaluate_only | -evaluate_all ] [{{[-evaluate_all ] [-evaluate_only ]} [{{[-view <string>] [-
early ] [-late ] [-output_as_tcl ] [-sort_by {slack trans area}]]}] [ -early | -late ][ -fall
| -rise ] [-first_spread_distance <double>]
```

Adds either a single buffer or two inverters to a net. In multi-mode multi-corner (MMMC) mode, this command adds a repeater and updates timing in all views. Optionally, you can specify the location of the buffer or inverters relative to the sink pin.

Note:

Evaluation is not yet supported for the `eco_add_repeater` command.

You do not need to provide physical information (LEF/DEF) in order to perform ECO with this command.

Parameters

<code>-buffer_orient string</code>	Specifies the legalized orientation for the repeater instance. Note: You can specify this parameter with the <code>-location</code> parameter only.
<code>-cells string</code>	Specifies the library cell to be used as repeater. If the cell is an inverter, two inverters in series will be added.
<code>-early</code>	Specifies that timing will be evaluated for early analysis. In such a case, only the active hold analysis views will be considered. If this parameter is not specified, timing will be evaluated for late analysis. Note: This parameter must be specified with <code>-evaluate_only</code> or <code>-evaluate_all</code> only.
<code>-evaluate_all</code>	Specifies to only evaluate timing for all buffer/inverter/delay cells with matching footprint (or all footprints) without any changes in the netlist.

<code>-evaluate_only</code>	Specifies to only evaluate timing for the given buffer/inverter/delay cells without any changes in the netlist.
<code>-fall</code>	Specifies that the timing will be evaluated for fall transition. If this parameter is not specified, timing will be evaluated for both rise and fall transitions and the worst result is reported. Note: This parameter must be specified with <code>-evaluate_only</code> or <code>-evaluate_all</code> only.
<code>-first_spread_distance</code> <i>double</i>	Specifies the distance from driver after which the first repeater is to be added. Note: This parameter must be specified with <code>-spread_distance</code> .
<code>-late</code>	Specifies that timing will be evaluated for late analysis. In such a case, only the active setup analysis views will be considered. If this parameter is not specified, timing will still be evaluated for late analysis. Note: This parameter must be specified with <code>-evaluate_only</code> or <code>-evaluate_all</code> only.
<code>-location {x y x1 y1 x2 y2}</code>	Specifies the x and y coordinates for the location of the buffer or inverter pair. If you do not specify this parameter, the tool determines the location. If the cell is a buffer and the location is specified, the newly created buffer is placed at the specified location. If the cell is an inverter and only one location is specified, both inverters will be placed at the same location.
<code>-max_cells <integer></code>	Specifies the maximum number of improving and degrading cells (each) to be reported for evaluation.
<code>-name inst_name</code>	Specifies the base names of the new instances to be added.
<code>-net net_name</code>	Specifies the name of net on which the buffer will be added. All sinks of the net are buffered when this parameter is specified.
<code>-new_net_name netname</code>	Specifies the base name(s) for the new net(s) to be added.
<code>-output_as_tcl</code>	Displays the output as a TCL list instead of displaying as a text.
<code>-pins pin_or_ports</code>	Specifies a list of terminals with one common net.

<code>-relative_distance_to_sink value</code>	Specifies the location of the buffer instance based on its (relative) distance from the sink pin. The value is a number between 0 and 1 (both inclusive). A low value (such as 0.1) places the buffer near the sink. A high value (such as 0.9) places the buffer near the driver. You can use the value 0 to do sink term buffering and value 1 to do driver term buffering. The fraction is based on the length of the wire. Fractional values can only be specified for two-pin nets.
<code>-rise</code>	Specifies that the timing will be evaluated for rise transition. If this parameter is not specified, timing will be evaluated for both rise and fall transitions and the worst result is reported. Note: This parameter must be specified with <code>-evaluate_only</code> or <code>-evaluate_all</code> only.
<code>-spread_count integer</code>	Specifies the number of repeaters to be added for buffering. <i>Minimum:</i> 1 <i>Maximum:</i> INT_MAX
<code>-spread_distance float</code>	Specifies the distance (starting from driver) after which repeaters are to be added. <i>Minimum:</i> 2.2250738585072e-308 <i>Maximum:</i> 1073741.823
<code>-spread_prefix string</code>	Specifies the prefix used for new instances and nets added during spread buffering.
<code>-sort_by {slack trans area}</code>	Specifies the sorting order for evaluation.
<code>-view <string></code>	Specifies the active analysis views for which timing must be evaluated. If this parameter is not specified, timing will be evaluated for all active analysis views and results reported for the worst view. Note: This parameter must be specified with <code>-evaluate_only</code> or <code>-evaluate_all</code> only.

Examples

- The following examples are the two methods to add two back-to-back inverters:

- The following example adds two instances of INV0 inverter cell:

```
set eco_check_logical_equivalence true ; # default.
eco_add_repeater -cells {INV0} -name {{inst_0 inst_1}} ...
```

2. The following example adds two instances, one each of INV0 and INV1 inverter cells: -

```
set eco_check_logical_equivalence false ; # default: true.
eco_add_repeater -cells {INV0 INV1} -name {inst_0 inst_1} ...
```

After the first (1) method, you can run the following command to change one of the two inverter instances to a different inverter cell: -

```
eco_update_cell -cells {INV1} -insts {<full hierarchical name of inst_1>}
```

- The following command inserts a repeater with cell `BUF4` on the net connected to terminal `DTMF_INST/RESULT_CONV_INST/RE_PHC369_r1336_0_/Y`:

```
tempus> eco_add_repeater -term DTMF_INST/RESULT_CONV_INST/RE_PHC369_r1336_0_/Y -cell BUF4
```
- The following command inserts a repeater with cell `BUF4` and attaches it to (driver) terminal `DTMF_INST/RESULT_CONV_INST/RE_PHC369_r1336_0_/Y`:

```
tempus> eco_add_repeater -term DTMF_INST/RESULT_CONV_INST/RE_PHC369_r1336_0_/Y -cell BUF4 -relativeDistToSink 1
```
- The following command inserts a repeater with cell `BUF4` and attaches it to (sink) terminal `DTMF_INST/RESULT_CONV_INST/RE_PHC369_r1336_0_/A`:

```
tempus> eco_add_repeater -term DTMF_INST/RESULT_CONV_INST/RE_PHC369_r1336_0_/A -cell BUF4 -relativeDistToSink 0
```
- The following command inserts a repeater with cell `BUF4` on net `n123`, places it at the given location, and names the new repeater instance `ECO_inst`:

```
tempus> eco_add_repeater -net n123 -cell BUF4 -loc {23.45 98.12} -name {ECO_inst}
```
- The following command inserts a repeater with cell `BUF4` at a relative distance of 0.3 from the sink terminal of the two-pin net `n123`:

```
tempus> eco_add_repeater -net n123 -cell BUF4 -relativeDistToSink 0.3
```
- The following command reports the evaluation results (worst setup timing across all views) of buffering pin, `MPY_32_INST/M16X16_INST/i_910/B0`, by adding each buffer/inverter/delay cell in the library that matches the footprint of cell, `BUF4`:

```
tempus> eco_add_repeater -pins MPY_32_INST/M16X16_INST/i_910/B0 -cells BUF4 -
evaluate_all
```

```

- The following commands add one instance of inverter `INVX1` after every 50 um distance, starting from the net's driver (polarity of some or all sinks may get reversed when odd number of instances are added):

```
set_db eco_check_logical_equivalence false
eco_add_repeater -net n123 -cells INVX1 -spread_distance 50
```

- The following commands add one instance of inverter `INVX1` after every 50 um distance, starting from the net's driver, and if required, one instance of this inverter at a sink to preserve its polarity:

```
set_db eco_check_logical_equivalence true
eco_add_repeater -net n123 -cells INVX1 -spread_distance 50
```

- The following command adds 10 instances of buffer `BUFX1`, equi-distant from each other, such that only the specified sinks are buffered:

```
eco_add_repeater -pins {sink1 sink3} -cells BUFX1 -spread_count 10
```

- The following command adds one instance each of buffers `BUFX1`, `BUFX2`, `BUFX3`, and `BUFX4`, equi-distant from each other, such that all the sinks of this net are buffered [total 4 instances added]:

```
eco_add_repeater -net n123 -cells {BUFX1 BUFX2 BUFX3 BUFX4} -spread_count 4
```

- The following commands add two instances each of inverters `INVX1` and `INVX3`, and one instance each of buffers `BUFX2` and `BUFX4`, each buffer or inverter equi-distant from each other, such that only the specified sinks are buffered [total 6 instances added]:

```
set_db eco_check_logical_equivalence true
eco_add_repeater -pins {sink1 sink3} -cells {INVX1 BUFX2 INVX3 BUFX4} -spread_count 4
```

- The following command adds one instance of buffer `BUFX1` after every 50 um distance starting from the net's driver:

```
eco_add_repeater -net n123 -cells BUFX1 -spread_distance 50 -spread_prefix {ab}
```

The added instances are named as `ab_inst_0`, `ab_inst_1`, ... and the added nets are named as `ab_net_0`, `ab_net_1`, ...

- The following command adds four instances of buffer `BUFX1`, equidistant from each other so that all sinks of the net are buffered:

```
eco_add_repeater -net n123 -cells BUFX1 -spread_count 4 -spread_prefix {mn}
```

The added instances are named: `mn_inst_0`, `mn_inst_1`, ... and the added nets are named as `mn_net_0`, `mn_net_1`, ...

**Note:** The suffix number automatically starts after the last buffer or inverter added earlier.

- The following command adds the first buffer (BUFFD4BWP) after 20 micron distance from the driver term, and subsequent buffers after 50 micron distance from the previous buffer.

```
eco_add_repeater -net iso -cell BUFFD4BWP -spread_distance 50 -first_spread_distance 20
```

## Related Commands

## eco\_delete\_repeater

eco\_delete\_repeater

```
[-help] {-insts <string> | -inverter_pair <string>} [-early | -late] [[-evaluate_only]
[[[-view <string>] [-early] [-late] [-fall | -rise] [-output_as_tcl]]]]
```

Deletes a specified buffer or pair of inverters connected back-to-back. In multi-mode multi-corner (MMMC) mode, this command deletes a repeater and updates timing in all views. The command searches backward, then forward, for another inverter pair to delete. This command merges parasitics by default. You might see an unconnected wire after committing the change; however, there is no impact on timing results due to such unconnected wires.

**Note:** Evaluation is not yet supported for the `eco_delete_repeater` command. You do not need to provide physical information (LEF/DEF) in order to perform ECO with this command.

## Parameters

|                                         |                                                                                                                                                                                                                                                                                                                                                            |

| <code>-rise</code>                      | <p>Specifies that the timing will be evaluated for rise transition. If this parameter is not specified, timing will be evaluated for both rise and fall transitions and the worst result is reported.</p> <p><b>Note:</b> This parameter must be specified with <code>-evaluate_only</code> only.</p>                                                      |
| <code>-view</code><br><string>          | <p>Specifies the active analysis views for which timing must be evaluated. If this parameter is not specified, timing will be evaluated for all active analysis views and results reported for the worst view.</p> <p><b>Note:</b> This parameter must be specified with <code>-evaluate_only</code> or <code>-evaluate_all</code> only.</p>               |

## Examples

- Consider three inverters connected in series: `instA -> inv1 -> inv2 -> inv3 -> instB` (where instances `instA` and `instB` are not inverters).
  - The following command deletes inverters `inv1` and `inv2`: -  

```
tempus> eco_delete_repeater -inst inv1
```
  - The following command deletes inverters `inv2` and `inv3`: -  

```
tempus> eco_delete_repeater -inst inv3
```
  - If `inv1` can be deleted, the following command deletes inverters `inv1` and `inv2` (even if `inv3` can also be deleted): -  

```
tempus> eco_delete_repeater -inst inv2
```
  - If `inv1` cannot be deleted but `inv3` can be deleted, the following command deletes inverters `inv2` and `inv3`: -  

```
tempus> eco_delete_repeater -inst inv2
```
- The following command deletes instances `DTMF_INST/RESULTS_CONV_INST/FE_PHC845_r1644_2_` and `DTMF_INST/RESULTS_CONV_INST/FE_PHC845_r1643_3_`:  

```
tempus> eco_delete_repeater -insts {DTMF_INST/RESULTS_CONV_INST/FE_PHC845_r1644_2_
DTMF_INST/RESULTS_CONV_INST/FE_PHC845_r1643_3_}
```
- The following command reports the evaluation results (worst setup timing across all views) of deleting buffer, `TDSP_CORE_INST/MPY_32_INST/M16X16_INST/mul_8_14/FE_PSC514_n_1670`:  

```
tempus> eco_delete_repeater -insts
TDSP_CORE_INST/MPY_32_INST/M16X16_INST/mul_8_14/FE_PSC514_n_1670 -evaluate_only
```

```

Changes the cell of an instance. In multi-mode multi-corner (MMMC) mode, this command changes the cell and updates timing in all views. This command upsizes or downsizes the specified instance based on the available footprint. Cell mapping is also possible as long as the output pins are functionally equivalent. This command also checks for and observes power domains.

This command has the following features:

- Changes the cell
- Performs incremental timing updates of the paths passing through the cell
- Supports spf, LEF, and DEF-based flows

## Note:

You do not need to provide physical information (LEF/DEF) in order to perform ECO with this command.

When resizing instances inside multiple-instantiated blocks, the resize would be applied to all instantiations of the block.

## Parameters

|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                                             |                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-cells <i>string</i></code>           | Specifies name of the new cell of the given instance. The function of the original cell has to match the function of the new cell for all the outputs used by the old cell. The number of input pins have to be the same for both the original cell and the new cell.                                                           |
| <code>-down_size</code>                     | Downsizes the specified instance with the next available cell in the same footprint unless the specified cell is already of the lowest driving strength. Downsizing an instance on the noncritical path can reduce the loading of its driver on the critical path.                                                              |
| <code>-early</code>                         | Specifies that timing will be evaluated for early analysis. In such a case, only the active hold analysis views will be considered. If this parameter is not specified, timing will be evaluated for late analysis.<br><b>Note:</b> This parameter must be specified with <code>-evaluate_only/-evaluate_all</code> only.       |
| <code>-evaluate_all</code>                  | Allows to evaluate new timing(s) through the instance by using all functionally equivalent library cell(s) for the instance.                                                                                                                                                                                                    |
| <code>-evaluate_only</code>                 | Allows to evaluate new timing through the instance by using the specified library cell for the instance.                                                                                                                                                                                                                        |
| <code>-from <i>string</i></code>            | Specifies the input pin for the instance to be evaluated for resize. Both the rise and fall transitions are considered in timing report.<br><b>Note:</b> This parameter must be specified with <code>-evaluate_only/-evaluate_all</code> only.                                                                                  |
| <code>-from_fall <i>string</i></code>       | Specifies the input pin for the instance to be evaluated for resize. Only the fall transition is considered in timing report.<br><b>Note:</b> This parameter must be specified with <code>-evaluate_only/-evaluate_all</code> only.                                                                                             |
| <code>-from_rise <i>string</i></code>       | Specifies the input pin for the instance to be evaluated for resize. Only the rise transition is considered in timing report.<br><b>Note:</b> This parameter must be specified with <code>-evaluate_only/-evaluate_all</code> only.                                                                                             |
| <code>-insts <i>string</i></code>           | Specifies the name of the instance to be resized.                                                                                                                                                                                                                                                                               |
| <code>-late</code>                          | Specifies that timing will be evaluated for late analysis. In such a case, only the active setup analysis views will be considered. If this parameter is not specified, timing will still be evaluated for late analysis.<br><b>Note:</b> This parameter must be specified with <code>-evaluate_only/-evaluate_all</code> only. |
| <code>-location {x<br/>y}</code>            | Specifies the legalized location where the instance will be placed.                                                                                                                                                                                                                                                             |
| <code>-max_cells<br/>&lt;integer&gt;</code> | Specifies the maximum number of improving and degrading cells (each) to be reported for evaluation.                                                                                                                                                                                                                             |

|                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-orient<br/>string</code>                        | <p>Specifies the legalized orientation for the instance.</p> <p>You can specify this parameter with the <code>-location</code> parameter only.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>-<br/>output_as_tcl</code>                       | <p>Returns the evaluation result as a Tcl list. By default, the command returns text-based format.</p> <p><b>Note:</b> This parameter must be specified with <code>-evaluate_only/-evaluate_all</code> only.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>-pin_maps<br/>string</code>                      | <p>Specifies the pin mapping for the new cell based on the old cell. This option is required if the new master cell has different pin names than the original cell. The net connected to <i>oldpin1</i> of the original cell should be connected to <i>newpin1</i> of the new cell, and so forth.</p>                                                                                                                                                                                                                                                                                                                                                |
| <code>-sort_by<br/>{slack delay<br/>trans area}</code> | <p>Specifies the sorting order for evaluation output.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>-timing_type<br/>&lt;timing_type&gt;</code>      | <p>Specifies the type of the timing arc to be used for timing evaluation between the specified <code>-from/-from_rise/-from_fall</code> and <code>-to/-to_rise/-to_fall</code> pins. The software will check for valid timing_types:</p> <ul style="list-style-type: none"> <li>• If only one arc is available, it will proceed.</li> <li>• If multiple arcs available, you need to specify which timing_type to be considered via this parameter.</li> </ul> <p><b>Note:</b> This parameter must be specified with <code>-evaluate_only/-evaluate_all</code> only. For valid timing types, refer to section, <b>List of Valid Timing-types</b>.</p> |
| <code>-to string</code>                                | <p>Specify one of the following:</p> <ul style="list-style-type: none"> <li>• The output pin of the instance to be evaluated for resize, or</li> <li>• The input pin for the instance driven by the instance to be evaluated for resize.</li> </ul> <p><b>Note:</b> This parameter must be specified with <code>-evaluate_only/-evaluate_all</code> only.</p>                                                                                                                                                                                                                                                                                        |
| <code>-to_fall<br/>string</code>                       | <p>Specifies name of the target pin of the cell to be resized, or the input pin of the next-stage cell. Only the fall transition is considered in the timing report.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>-to_rise<br/>string</code>                       | <p>Specifies name of the target pin of the cell to be resized, or the input pin of the next-stage cell. Only the rise transition is considered in the timing report.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>-up_size</code>                                  | <p>Upsizes the specified instance with the next available cell in the same footprint unless the specified cell is already of the highest driving strength. Upsizing an instance that drives a large load can improve the driver delay and the transition time at the receivers.</p>                                                                                                                                                                                                                                                                                                                                                                  |

|                                  |                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-view <i>string</i></code> | <p>Specifies the active analysis views for which timing must be evaluated. If this parameter is not specified, timing will be evaluated for all active analysis views and results reported for the worst view.</p> <p><b>Note:</b> This parameter must be specified with <code>-evaluate_only</code> or <code>-evaluate_all</code> only.</p> |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

- The following command substitutes the cell for instance `DTMF_INST/RESULTS_CONV_INST/FE_PHC268_r1477_1_` with cell `DLY3X2`. Pin A maps to pin I and pin Y maps to pin O of the new cell.  

```
tempus> eco_update_cell -insts DTMF_INST/RESULTS_CONV_INST/FE_PHC268_r1477_1_ -cells DLY3X2 -pin_maps {A I Y O}
```
- The following command substitutes the cell for instance `DTMF_INST/RESULTS_CONV_INST/FE_PHC268_r1477_1_` with cell `BUF2`.  

```
tempus> eco_update_cell -insts DTMF_INST/RESULTS_CONV_INST/FE_PHC268_r1477_1_ -cells BUF2
```
- The following command upsizes the cell for instance `DTMF_INST/RESULTS_CONV_INST/FE_PHC268_r1477_1_` and places the instance at the given location.  

```
tempus> eco_update_cell -insts DTMF_INST/RESULTS_CONV_INST/FE_PHC268_r1477_1_ -up_size -location {23.45 98.12}
```
- The following command evaluates timing for instance, `TDSP_CORE_INST/TDSP_CORE_GLUE_INST/lsh_120_47/FE_PSC502_n_661`, using library cell `BUF_X32` (prints delay for A to Y arc, slack at A pin, and slew at Y pin, corresponding to the worst timing path) :  

```
tempus > eco_update_cell -cells BUF_X32 -from TDSP_CORE_INST/TDSP_CORE_GLUE_INST/lsh_120_47/FE_PSC502_n_661/A -to TDSP_CORE_INST/TDSP_CORE_GLUE_INST/lsh_120_47/FE_PSC502_n_661/Z -evaluate_only
```

From Pin: `TDSP_CORE_INST/TDSP_CORE_GLUE_INST/lsh_120_47/FE_PSC502_n_661/A`  
To Pin: `TDSP_CORE_INST/TDSP_CORE_GLUE_INST/lsh_120_47/FE_PSC502_n_661/Z`

```

```

## Related Commands

- `eco_add_repeater`
- `eco_delete_repeater`
- `set_db`

## eco Category Attributes

The root attributes in the eco category are:

- `eco_add_ports`
- `eco_batch_mode`
- `eco_check_logical_equivalence`
- `eco_client_tempus_executable`
- `eco_def_file_list`
- `eco_delay_calculation_effort`
- `eco_dynamic_view`
- `eco_drv_view_list`
- `eco_hold_view_list`
- `eco_honor_dont_touch`
- `eco_honor_dont_use`
- `eco_honor_fixed_status`
- `eco_honor_fixed_wires`
- `eco_honor_power_intent`
- `eco_leakage_view`
- `eco_lef_file_list`
- `eco_prefix`
- `eco_preserve_hpin_function`
- `eco_refine_place`
- `eco_select_partition_list`
- `eco_setup_view_list`
- `eco_si_effort`
- `eco_update_only_layers`
- `eco_update_timing`

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `eco` category, use the following command:

```
get_db -category eco
```

## eco\_add\_ports

```
eco_add_ports {true|false}
```

*Default:* true

*Data\_type:* Boolean

Determines whether to add hierarchical module ports during buffering.

**Note:** This attribute works only for the Manual ECO commands.

## eco\_batch\_mode

```
eco_batch_mode {true|false}
```

*Default:* false

*Data\_type:* Boolean

Speeds up the runtime in case the user performs lots of interactive ECO operations. When the user specifies `eco_batch_mode true`, various ECO operations are performed in a batch and initialization steps are not performed for every ECO call. In addition, updating timing is performed only once for all the ECO operations. Tool will only perform timing initialization at the first ECO command in the batch mode and timing update at the time of exiting the batchMode. User needs to specify `batchMode false` to exit the batchMode.

The batch mode is activated by `eco_batch_mode true` and exited by `eco_batch_mode false`, and only `eco_add_repeater`, `eco_delete_repeater` and `eco_update_cell` could be given in between `eco_batch_mode true` and `eco_batch_mode false`:

```
eco_batch_mode true
eco commands (eco_add_repeater, eco_delete_repeater, eco_update_cell)
eco_batch_mode false
```

If a user activates the batch mode, then the user needs to remember to exit it. If the user does not exit the batch mode, the user might see some unexpected results. For example, if the tool automatically added cell padding for blocks when `place_detail` is called by ECO commands for some reason, the cell padding will not be removed and the block size will change unless the user exits the batch mode.

All other settings should be made prior to activating the batch mode. If you would like to change settings, you need to exit the batch mode first.

**Note:** This option supports all commit ECO commands. Evaluation commands are not supported.

## Related Commands

- `place_detail`

## eco\_check\_logical\_equivalence

`eco_check_logical_equivalence {true|false}`

*Default:* `true`

*Data\_type:* Boolean

Enables functionality checking when swapping cells. The software can swap cells that are logically equivalent.

When `-eco_check_logical_equivalence` is `true`:

- `eco_add_repeater` adds inverter pair if the specified cell is inverter.
- `eco_delete_repeater` deletes inverter pair if the specified instance is inverter.
- `eco_update_cell` changes cell to another cell type with the same function as long as they have same number of pins.

When `-eco_check_logical_equivalence` is set to `false`:

- `eco_add_repeater` can add only one single inverter if the specified cell is inverter.
- `eco_delete_repeater` can delete only one single inverter if the specified instance is inverter.
- `eco_update_cell` can perform nonequivalent cell change as long as they have same number of pins.

## Related Commands

- `eco_add_repeater`
- `eco_delete_repeater`
- `eco_update_cell`

## eco\_client\_tempus\_executable

`eco_client_tempus_executable string`

*Default:* `" "`

*Data\_type:* String

Sets the executable name for Tempus clients in ECO mode.

## eco\_def\_file\_list

`eco_def_file_list` *string*

*Default:* " "

*Data\_type:* String

Sets the DEF files for using with the Tempus logical flow.

## eco\_delay\_calculation\_effort

`eco_delay_calculation_effort` {low | medium | high}

*Default:* high

*Data\_type:* String

Determines the delay calculation effort level as low, medium, or high.

## eco\_dynamic\_view

`eco_dynamic_view` *string*

*Default:* " "

*Data\_type:* String

Sets the dynamic power view name for the ECO master session.

**Note:** This global is used only in the Paradime ECO flow.

## eco\_drv\_view\_list

`eco_drv_view_list` *string*

*Default:* " "

*Data\_type:* String

Specifies the list of DRV views for Tempus ECO run.

**Note:** This global is used only in the Paradime ECO flow. The views specified in `eco_drv_view_list` along with `eco_setup_view_list` will be considered as DRV views.

## eco\_hold\_view\_list

`eco_hold_view_list` *string*

*Default:* ""

*Data\_type:* String

Sets the view names for Tempus ECO master.

## eco\_honor\_dont\_touch

`eco_honor_dont_touch` *cellName*

*Default:* true

*Data\_type:* Boolean

Checks for the don't touch attribute on nets and instances. If you specify a terminal list, this parameter checks each terminal for the don't touch attribute. The `ecoAddRepeater` command honors the don't touch nets. The `eco_delete_repeater` and `eco_update_cell` commands honor don't touch instances.

### Related Commands

- `eco_delete_repeater`
- `eco_update_cell`

## eco\_honor\_dont\_use

`eco_honor_dont_use` {true|false}

*Default:* true

*Data\_type:* Boolean

Checks for the don't use attribute on cells. The `eco_add_repeater`, `eco_delete_repeater`, and `eco_update_cell` commands honor don't use cells.

### Related Commands

- `eco_add_repeater`
- `eco_delete_repeater`
- `eco_update_cell`

## eco\_honor\_fixed\_status

`eco_honor_fixed_status {true|false}`

*Default:* `true`

*Data\_type:* [Boolean](#)

Checks for fixed net wires.

It restricts the addition or deletion on fixed net so that the fixed status of the wires is not altered.

## eco\_honor\_fixed\_wires

`eco_honor_fixed_wires {true|false}`

*Default:* `true`

*Data\_type:* [Boolean](#)

Checks for fixed net wires.

It restricts the addition or deletion on fixed net so that the fixed status of the wires is not altered.

When `-eco_honor_fixed_wires` is set to `false`, [eco\\_add\\_repeater](#) can insert a cell on the wires with the FIXED/COVER status and change the status of these wires from FIXED/COVER to ROUTED.

## eco\_honor\_power\_intent

`eco_honor_power_intent {true|false}`

*Default:* `true`

*Data\_type:* [Boolean](#)

Performs Multi Supply Voltage Design (MSV) checks during ECO.

When this parameter is set to `true`:

- [eco\\_update\\_cell](#) does not allow:
  - Resizing a regular cell with an always-on cell (and vice-versa).
  - Resizing with cells belonging to different power domains.
- [eco\\_add\\_repeater](#) does not allow:
  - Adding buffer to a power domain it doesn't belong to.
  - Buffering a cross power domain net if it can cause MSV violations.
  - Adding a regular buffer to a net that requires an always-on buffer.

- Adding an always-on buffer to a net that does not require an always-on buffer.
- `eco_delete_repeater` does not allow deletion of a buffer or an inverter-pair that will cause:
  - A redundant isolation cell.
  - A CPF-constrained net to be deleted.

## **eco\_leakage\_view**

`eco_leakage_view` *string*

*Default:* " "

*Data\_type:* String

Sets the leakage power view name for the ECO master session.

**Note:** This global variable is used only in the Paradime ECO flow.

## **eco\_lef\_file\_list**

`eco_lef_file_list` *string*

*Default:* " "

*Data\_type:* String

Sets the LEF files for using with Tempus logical flow.

## **eco\_prefix**

`eco_prefix` *prefix*

*Default:* ECO

*Data\_type:* String

Adds a prefix to the inserted cells.

## **eco\_preserve\_hpin\_function**

`eco_preserve_hpin_function` *prefix*

*Default:* false

*Data\_type:* Boolean

Determines whether to preserve logical functions at the hierarchical module ports.

**Note:** This option works only for manual ECO commands.

## eco\_refine\_place

```
eco_refine_place {true|false}
```

*Default:* true

*Data\_type:* Boolean

Legalizes placement whenever `eco_add_repeater` or `eco_update_cell` are used. If `false`, you must run `place_detail` after ECO if you want to legalize placement.

**Note:** Specifying `eco_refine_place true` can affect performance when large numbers of cells are added or modified.

## eco\_select\_partition\_list

```
eco_select_partition_list string
```

*Default:* " "

*Data\_type:* String

Lists the subset of partitions for which the physical data has to be loaded while merging the DEF files although user might point to all available DEF files using the `eco_def_file_list` global variable.

**Note:** This global variable is used only in the Paradime ECO flow.

## eco\_setup\_view\_list

```
eco_setup_view_list string
```

*Default:* " "

*Data\_type:* String

Sets the view names for Tempus ECO master.

## eco\_si\_effort

```
eco_si_effort {low|medium}
```

*Default:* low

*Data\_type:* String

Sets the SI effort level as `low` or `medium` used in the timing update.

## eco\_update\_only\_layers

`eco_update_only_layers` *string*

*Default:* ""

*Data\_type:* String

Specifies the layers on which the wires can be cut during buffering.

## eco\_update\_timing

`eco_update_timing` {true|false}

*Default:* true

*Data\_type:* Boolean

Controls whether to `eco*` commands recompute timing. If `true`, the `eco*` commands recompute timing. If `false`, the commands do not recompute timing, and us can later use `report_timing` to recompute timing.

### Related Commands

- [eco\\_add\\_repeater](#)
- [eco\\_delete\\_repeater](#)
- [eco\\_update\\_cell](#)

## read\_eco

`read_eco`  
[-help]  
`eco_files`

Reads a file that was generated in db format using the `write_eco -format db` command.

### Parameters

|                        |                                                                                                                                                 |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>eco_files</code> | Specifies the name of the file that contains the ECO directives. You can specify more than one file. File names must be separated by one space. |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|

### Examples

The following example reads `myfile` generated by the `write_eco` command.

```
tempus> read_eco myfile
```

## Related Commands

- `write_eco`

## write\_eco

```
write_eco
[-help]
-format {innovus tempus}
-hierarchical
out_file
-prefix <prefix>
[-skip_non_eco_commands]
```

Logs ECO commands into an output file per file format. You can later load the files in the following ways:

- Source the innovus format file in the Innovus tool
- Source the `tempus` format file into the Tempus tool

The following commands can be appended to the report file:

- `create_net`
- `delete_nets`
- `create_inst`
- `delete_inst`
- `connect_net`
- `disconnect_net`
- `eco_update_cell`
- `eco_add_repeater`
- `eco_delete_repeater`

## Parameters

|                                           |                                                                                                               |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>-format {innovus<br/>tempus}</code> | Generates an ECO file in the specified format.                                                                |
| <code>-hierarchical</code>                | Generate an ECO file for optimized partitions.                                                                |
| <code>out_file</code>                     | Specifies the name of the file generated using this command.                                                  |
| <code>-prefix &lt;prefix&gt;</code>       | Specifies the prefix to be used in naming the output ECO file.                                                |
| <code>-<br/>skip_non_eco_commands</code>  | Removes all non-ECO commands, which are not specified by the user from the automatically generated ECO files. |

## Examples

- The following command logs ECO commands into file `Tempus.eco`, in the `tempus` format:  

```
write_eco -format tempus Tempus.eco
```
- The following command logs ECO command into file `innovus.eco`, in the `innovus` format:  

```
write_eco -format innovus innovus.eco
```
- The following command removes all non-ECO commands from the automatically generated ECO file, `opt_eco_tempus_cui.tcl`:  

```
write_eco opt_eco_tempus_cui.tcl -format tempus -skip_non_eco_commands
```

- [get\\_multi\\_cpu\\_usage](#)
- [monitor\\_distributed\\_hosts](#)
- [report\\_resource](#)
- [set\\_distributed\\_hosts](#)
- [set\\_multi\\_cpu\\_usage](#)

# check\_multi\_cpu\_usage

check\_multi\_cpu\_usage  
[-help]

Checks if distributed processing can work in the software environment. This command also ensures that the working directory is accessible from the master machine as well as the client machines. The `check_multi_cpu_usage` command is specified after configuring the multi-CPU settings (`set_distributed_hosts` and `set_multi_cpu_usage`) to check if all the specified CPUs can be accessed. This command should be invoked before running any commands that use multiple CPUs.

## Parameters

|       |                               |
|-------|-------------------------------|
| -help | Prints out the command usage. |
|-------|-------------------------------|

## Examples

Here are some examples.

- The following example command script checks the distributed computing environment when `set_distributed_hosts -local` is specified:

```
tempus > check_multi_cpu_usage

/it/sjclapa06p6_scr02/clre/exp_2017_05_30/0223/dy/2014/2017/0413

## Related Commands

- `set_multi_cpu_usage`
- `get_multi_cpu_usage`

## get\_distributed\_hosts

```
get_distributed_hosts
[-help]
[-args]
[-custom_script]
[-env_script]
[-hosts]
[-mode]
[-queue]
[-report_lsf_info <file>]
[-resource]
[-shell_timeout]
[-single_cpu_lsf_args]
[-timeout]
[-wait_for_lsf_info <integer>]
```

Displays settings for the `set_distributed_hosts` command.

## Parameters

|                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-args</code>                              | Displays the additional arguments when the software is running in the Sun Grid Engine (SGE) or Load Sharing Facility (LSF) mode.                                                                                                                                                                                                                                                                                             |
| <code>-custom_script</code>                     | Displays the name of the custom script when the software is running in <code>custom</code> mode.                                                                                                                                                                                                                                                                                                                             |
| <code>-env_script</code>                        | Displays the value of the environment script for slave start up.                                                                                                                                                                                                                                                                                                                                                             |
| <code>-hosts</code>                             | Displays the list of host names when the software is running in <code>rsh</code> mode.                                                                                                                                                                                                                                                                                                                                       |
| <code>-help</code>                              | Outputs the command usage and a brief description about the command parameters.                                                                                                                                                                                                                                                                                                                                              |
| <code>-mode</code>                              | Displays the distributed processing mode. The possible values are <code>local</code> , <code>sge</code> , <code>rsh</code> , <code>ssh</code> , <code>lsf</code> and <code>custom</code> .<br><br><i>Default:</i> <code>local</code>                                                                                                                                                                                         |
| <code>-queue</code>                             | Displays the queue name when the software is running in <code>sge</code> or <code>lsf</code> mode.                                                                                                                                                                                                                                                                                                                           |
| <code>-report_lsf_info</code><br><i>file</i>    | Specifies to restore the LSF information to the specified file. This parameter can only be used when <code>setDistributeHost -report_lsf_info</code> is specified in the current session.<br><br>You must specify the <code>get_distributed_hosts -report_lsf_info</code> only after the LSF tasks exit to obtain the task CPU time. If you specify this command before the task exits, the command gives a warning message. |
| <code>-resource</code>                          | Displays the resource string when the software is running in <code>sge</code> or <code>lsf</code> mode.                                                                                                                                                                                                                                                                                                                      |
| <code>-shell_timeout</code>                     | Displays the number of seconds the host machine waits for <code>rsh/ssh</code> machines to become available for multiple-CPU processing.                                                                                                                                                                                                                                                                                     |
| <code>-single_cpu_lsf_args</code>               | Displays the lsf arguments when the software is running in <code>lsf</code> mode for a single CPU application.                                                                                                                                                                                                                                                                                                               |
| <code>-timeout</code>                           | Displays the default timeout for a submitted job that will never start.                                                                                                                                                                                                                                                                                                                                                      |
| <code>-wait_for_lsf_info</code><br><i>value</i> | Specifies the timeout period required to wait for task exit and generate the LSF information.                                                                                                                                                                                                                                                                                                                                |

## Examples

- The following command displays the current setting for the `-mode` parameter:

```
get_distributed_hosts -mode
local
```

- The following command saves the LSF information to the `lsf.log` file:

```
get_distributed_hosts -report_lsf_info lsf.log
```

## Related Commands

- [set\\_distributed\\_hosts](#)

# get\_multi\_cpu\_usage

```
get_multi_cpu_usage
[-help]
[-auto_page_fault_monitor]
[-cpu_per_remote_host]
[-keep_license]
[-local_cpu]
[-remote_host]
[-thread_info]
[-verbose]
```

Displays the requested number of threads or hosts.

To request threads or hosts, use [set\\_multi\\_cpu\\_usage](#).

## Parameters

|                              |                                                                                                   |
|------------------------------|---------------------------------------------------------------------------------------------------|
| -help                        | Prints out the command usage.                                                                     |
| -<br>auto_page_fault_monitor | Displays the warning rank set for performance issues caused by major page faults                  |
| -cpu_per_remote_host         | Displays the number of CPUs available on every remote host for Superthreading.                    |
| -help                        | Outputs the command usage and a brief description about the command parameters.                   |
| -keep_license                | Displays the current setting for the <a href="#">set_multi_cpu_usage -keep_license</a> parameter. |
| -local_cpu                   | Displays the number of available local CPUs for multi-threading.                                  |
| -remote_host                 | Displays the number of available remote hosts for distributed processing or Superthreading.       |
| -thread_info                 | Displays the level of informational messages for each thread.                                     |
| -verbose                     | Displays a message with the current multiple-CPU setting.                                         |

## Examples

- The following command displays the requested number of threads for multi-threading:  
`get_multi_cpu_usage -local_cpu`
- The following command displays the requested number of remote hosts for Superthreading or distributed processing:  
`get_multi_cpu_usage -remote_host`
- The following command displays the requested number of CPUs per remote hosts for Superthreading:  
`get_multi_cpu_usage -cpu_per_remote_host`

## Related Commands

- `set_multi_cpu_usage`

# monitor\_distributed\_hosts

```
monitor_distributed_hosts
[-help]
[-log string]
[-overwrite]
[-period integer]
```

Monitors hosts and periodically dumps memory or CPU usage information for each host to a file. This command automatically determines the hosts to be monitored. By default, after every 60 seconds hosts are monitored and the disk information is written to a log file. This command is not required for DMMMC because it also performs client monitoring.

## Parameters

|                        |                                                                                                                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -help                  | Prints out the command usage. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man monitor_distributed_hosts</code> . |
| -log <i>string</i>     | Specifies the log file name.<br><i>Default:</i> host-monitor.log                                                                                                                  |
| -overwrite             | Overwrites the log file, if it already exists.                                                                                                                                    |
| -period <i>integer</i> | Specifies the sampling period after which hosts will be monitored.<br><i>Default:</i> 60                                                                                          |

## Examples

- A sample monitor log file is shown below:

```
Status keys: E excellent, G good, B bad, T terrible.
Memory values:
total = Real memory of host
progs = Real memory used by processes, including swappable cache
used = Real memory used by processes, excluding swappable cache
Started at: 17/04/25 04:24:22
lgi15(0) TMPDIR is : /tmp/tempus_temp_20836_lgi15_ark_lEAcvw

=====
Host CPU Memory (GB) TMPDIR (GB) (Mb/s)
name(id) util % total progs used %used total avail rate

```

## Related Commands

- `set_multi_cpu_usage`

## report\_resource

```
report_resource
[-help]
[-peak]
[-verbose]
[-start string | [-end string [-session_cpu] [-diff_memory]]]
[-check_MemCpu {true | false} [-period integer]
[-memory_threshold float]
```

Displays the peak memory used during a software session. This command is used to measure the peak memory at any given point in the flow and and make the script better for automation flows.

### Parameters

|                                         |                                                                                                                                                                                                                                       |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -help                                   | Outputs the command usage and a brief description about the command parameters.                                                                                                                                                       |
| -<br>check_memory_cpu<br>{true   false} | Checks the machine's physical memory and CPU resources. When specified, the software enables memory/CPU checking and reports a warning if the free memory is below 5 percent of the total memory or if the average CPU load is large. |
| -diff_memory                            | Outputs different peak memory and current memory between the step start and step end.                                                                                                                                                 |
| -end <i>string</i>                      | Specifies the end point to measure the peak memory attained during a specific command.                                                                                                                                                |
| -<br>memory_threshold<br><i>float</i>   | Specifies the threshold as ratio of total machine/LSF memory. A warning is issued if the available memory goes below this threshold.<br><br><i>Min: 0</i><br><i>Max: 1</i>                                                            |
| -peak                                   | Reports current peak memory till a given point in a flow. This parameter also works with the -start and -end parameters of the report_resource command so that peak memory observed by an individual command can be reported.         |
| -period <i>integer</i>                  | Specifies the period for checking the physical memory and CPU usage.<br><br><i>Default: 1800s</i><br><i>Min: 1</i><br><i>Max: INT_MAX</i>                                                                                             |
| -session_cpu                            | Reports the current CPU and real-time after the reports' last step status.                                                                                                                                                            |

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-start string</code> | <p>Specifies the start point to measure the peak memory attained during a specific command.</p> <p><b>Note:</b> The <code>-start</code> and <code>-end</code> parameters support any user-specified string, such as <code>fullFlow</code>, <code>report_timing</code>, and <code>readDesign</code>. You must specify the same string for both the <code>-start</code> and <code>-end</code> parameters to measure the peak memory attained during a specific command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>-verbose</code>      | <p>Gives detailed memory usage information. It displays how much memory is being used at any time and of what form (physical vs. virtual). When specified, the following information is displayed:</p> <ul style="list-style-type: none"><li>• <code>Cpu(s)</code> is the number of available processors in the machine.</li><li>• <code>Load average</code> is the system load averages for the last 1 minute, 5 minutes, and 15 minutes.</li><li>• <code>Mem</code> and <code>Swap</code> are the current memory information of the machine.</li><li>• <code>Data Resident Set (DRS)</code> is the amount of physical memory devoted to other than executable code. "<code>current mem</code>" shows this value (Total current DRS) .</li><li>• <code>Private Dirty (DRT)</code> is the memory which must be written to disk before the corresponding physical memory location can be used for some other virtual page. "<code>peak res</code>" shows this value (Total peak DRT). This is the minimum number that you must reserve to run the program.</li><li>• <code>Virtual Size (VIRT)</code> is the total amount of virtual memory used by the task.</li><li>• <code>Resident Size (RES)</code> is the non-swapped physical memory a task has used. The number of "Total Peak RES" is the recommended physical memory to reserve.</li></ul> |

## Examples

- The following command specifies to display the memory used during a software session:

```
tempus> report_resource
```

The following message is displayed:

```
Current (total cpu=0:04:19, real=18:28:46, peak res=3540.1M, current mem=3403.7M)
```

- The following command specifies to display the peak memory up to a specified point in a flow:

```
tempus> report_resource -peak
```

The following message is displayed:

```
Current peak res=3540.1M
```

- The following command specifies to display the detailed memory information:

```
tempus> report_resource -verbose
```

The following output is displayed:

```
Current (total cpu=0:04:19, real=18:30:07, peak res=3540.1M, current mem=3403.7M)
```

```
Cpu(s) 40, load average (past 1 minute): 4.25, load average (past 5 minutes): 5.66, load
average (past 15 minutes): 10.70
```

```
Mem: 790948060k total, 741280860k used, 49667200k free, 7512k buffers
```

```
Swap: 134217724k total, 18325308k used, 115892416k free, 244555880k cached
```

Memory Detailed Usage :

|                     | Data Resident Set (DRS) | Private Dirty (DRT) | Virtual Size (VIRT) |
|---------------------|-------------------------|---------------------|---------------------|
| Resident Size (RES) |                         |                     |                     |
| Total current :     | 5575.0M                 | 2338.3M             | 9711.3M             |
| peak :              | 5761.5M                 | 2364.6M             | 9897.9M             |
|                     |                         |                     | 3403.7M             |
|                     |                         |                     | 3540.1M             |

- The following command specifies to display the end point to measure the peak memory attained during the `report_timing` command.

```
tempus> report_resource -end report_timing
```

The following message is displayed:

```
Ending "report_timing" (total cpu=0:00:00.7, real=0:03:57, peak res=3430.0M, current
mem=3403.7M)
```

- The following command script specifies to display the peak memory attained during the `report_timing` command:

```
tempus > report_resource -start report_timing
```

```
tempus > report_timing -machine_readable -max_paths 100
```

```
tempus > report_resource -end report_timing
```

The following message is displayed:

```
Ending "report_timing" (total cpu=0:00:55.9, real=0:00:56.0, peak res=1032.5M, current
mem=1213.2M)
```

- The following command script specifies to display the peak memory attained till the `report_timing` command:

```
tempus > report_timing -machine_readable -max_paths 100
```

```
tempus > report_resource -peak
```

The following message is displayed:

```
Current peak res=1032.4M
```

- The following command script specifies to display CPU time/memory information during Test:

```
tempus > report_resource -start Test
tempus > report_resource -start read_design
tempus > report_resource -end read_design
tempus > report_resource -start report_timing
tempus > report_timing -machine_readable -max_paths 100
tempus > report_resource -end report_timing
tempus > report_resource -end Test
```

The following message is displayed:

```
Ending "report_timing" (total cpu=0:00:55.8, real=0:00:56.0, peak res=1032.4M, current
mem=1213.1M)
```

```
Ending "Test" (total cpu=0:01:37, real=0:01:38, peak res=1032.4M, current mem=1213.1M)
```

## Related Commands

- [report\\_timing](#)

# set\_distributed\_hosts

```
set_distributed_hosts
[-help]
[out_file]
[-add string]
[-args string]
[-custom]
[-custom_script string]
[-custom_script_list string]
[-env_script string]
[-local]
[-lsf]
[-nc]
[-no_wait_task_come_up]
[-queue string]
[-remove string]
[-report_lsf_info]
[-resource string]
[-shell_timeout integer]
[-single_cpu_lsf_args string]
[-ssh]
[-time_out integer]
```

Specifies the multiple-CPU processing configuration for distributed processing or Superthreading. The software finds hosts from the last `set_distributed_hosts` command specified before a distributed processing or Superthreading command starts.

Use `get_distributed_hosts` to display the current settings for the `set_distributed_hosts` command.

 This command is required for distributed processing and Superthreading.

## Parameters

|       |                              |
|-------|------------------------------|
| -help | Prints out the command usage |
|-------|------------------------------|

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>out_file</code>              | <p>Specifies to report LSF information in a single report. This parameter allows you to collect the system statistics on the status of the distributed jobs. It has the following information:</p> <ul style="list-style-type: none"> <li>• Host name for master and LSF tasks</li> <li>• Number of CPUs on each machine that are being used by a process</li> <li>• Job ID/PID for each task process</li> <li>• Total memory used on each machine</li> <li>• Total virtual memory used on each machine</li> <li>• Total CPU time used on each machine</li> </ul> <p>You must specify this parameter with the <code>-lsf</code> parameter.</p> <p>To get the LSF information, specify the <code>get_distributed_hosts out_file</code> command parameter. You must specify the <code>get_distributed_hosts out_file</code> only after the LSF tasks exit to obtain the task CPU time. If you specify this command before the task exits, the command gives a warning message.</p> |
| <code>-add string</code>           | <p>Adds the specified hosts to the <code>rsh/ssh</code> configuration. If you specify more than one host, separate each host name with a space.</p> <p>Each time you specify a host, the software uses it to run one client process. To run more than one client process on a host, specify it more than once. For example, if you have two machines that each has two CPUs and you want to use both CPUs in both machines, type a command like the following:</p> <pre>set_distributed_hosts -add {machine1 machine2 machine1 machine2}</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>-args string</code>          | <p>Specifies any additional arguments you need to provide to the Sun Grid Engine (SGE) or Load Sharing Facility (LSF) job submission command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>-custom</code>               | <p>Specifies the use of custom job submission script for distributed processing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>-custom_script string</code> | <p>Specifies a custom script to run distributed processing. This includes custom job submission script and arguments for "custom" distributed processing mode.</p> <p>You can use this parameter with <code>-custom</code> only.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-custom_script_list<br/>string</code> | <p>Specifies custom job submission script list and arguments for "custom" distributed processing mode. for example, {{{stringCommand1} count1} {{stringCommand2} count2} ... {{stringCommandN} countN}}.</p> <p>Specifies to customize the launch of multiple jobs, based on resources required for these jobs. This parameter allows you to specify multiple launch strings in order of priority with a maximum allowed job count for each string.</p> <p>If you request for N number of jobs, the command starts submitting jobs starting from <i>string1</i>, until the corresponding count is reached, at which point it starts submitting the next string in the list. Therefore, the command submits the first "<i>count1</i>" jobs with <i>string1</i>, the next "<i>count2</i>" jobs with <i>string2</i> and so on. It stops when the total submitted jobs has reached the requested number (N).</p> <p><b>Note:</b> This parameter can only be specified with the <code>-custom</code> parameter.</p> |
| <code>-env_script string</code>             | <p>Specifies a user-defined shell environment script that is run for each of the client hosts. The parameter allows you to pass these environment settings to the client hosts by including them in the shell environment script. The license variables used by the software are also automatically passed to the client hosts to avoid license errors.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>-local</code>                         | <p>Run distributed processing job on the local machine.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>-lsf</code>                           | <p>Specifies a Load Sharing Facility configuration. If you do not specify any parameters for <code>-lsf</code>, the software uses default settings.</p> <p><b>Note:</b> To use this parameter, LSF must already be set up (typically by specifying the LSF_ENVDIR and LSF_SERVERDIR environment variables) and bsub must be in your search path. Contact your LSF administrator for details.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>-nc</code>                            | <p>Allows the software to use NC commands (Network Computer from RTDA) for distributed processing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Contact your LSF administrator for the appropriate parameters and values.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>-shell_timeout integer</code>      | <p>Specifies the number of seconds the host machine waits for <code>rsh/ssh</code> machines to become available for multiple-CPU processing.</p> <p><i>Default:</i> 5</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>-single_cpu_lsf_args string</code> | <p>Specifies the <code>bsub</code> options. For information, see the LSF documentation.</p> <p><b>Note:</b> You must use this parameter to adjust the LSF argument for a single CPU application. Alternatively, use the <code>-args</code> parameter to adjust the LSF argument for an application that runs in the Superthreading mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>-ssh</code>                        | <p>Specifies a secure shell configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>-time_out integer</code>           | <p>Specifies the default timeout for a submitted job that will never start. This functionality prevents the master machine from hanging when the clients do not come up for some reason.</p> <p>After timeout, a warning message appears informing you that the distributed CPUs did not come online within the expected time. The master will continue waiting for the clients and it is up to you to continue waiting or kill the run if there are problems with the Distributed Resource Management (DRM) system.</p> <p>A sample warning message is given below:</p> <p>Task id 2 did not come up within the specified timeout period (300 seconds). Use <code>set_distributed_hosts -timeout</code> to change the value. This may be a real error due to incorrect or incomplete platform/machine specification provided via <code>set_distributed_hosts</code> to your distributed resource management system (LSF/Sun Grid Engine etc.). If running locally (<code>set_distributed_hosts -local</code>), the current machine may be overloaded with too many jobs and swapping (check free memory and CPUs with <code>top</code>). For local runs, consider reducing the number of CPUs you are using via the <code>set_multi_cpu_usage</code> command or free up some memory by killing other memory intensive processes.</p> <p><i>Default:</i> 3600 for all the modes (LSF, NC, SGE, RSH, SSH, local and custom)</p> <p><b>Note:</b> When the <code>set_distributed_hosts</code> command is not specified, the software sets the default mode as local and the EDP timeout is 3600 seconds.</p> |

## Examples

## LSF

The following command uses an existing LSF environment, and relies on the general LSF set up by the system administrator. In this example, the name of the queue implies that all the machines have 4 Gb of memory.

```
set_distributed_hosts -lsf -queue mem4G
```

The following command schedules a LSF job named `bigQueue` to run on a Linux machine for a maximum of 30 minutes. No other jobs can run on the machine while `bigQueue` is running.

```
set_distributed_hosts -lsf -queue bigQueue -args {-x -W 30} \
-resource {OSNAME==Linux}
```

The following command schedules a LSF job named `smallQueue` to run on Linux machines with minimum speed of 2000 MHz.

```
set_distributed_hosts -lsf -queue smallQueue -args {-W 20} \
-resource {OSNAME==Linux && SPEED>2000}
```

**Note:** Check with your LSF administrator for the correct values for the resource string, as the parameters and their values differ in each installation. For example, the parameter name for the speed of the machine might be `MHZ` instead of `SPEED` (as in the preceding example), and the units might be specified in gigahertz instead of megahertz.

The following command specifies to report LSF information:

```
set_distributed_hosts -lsf -args "-q lnx64" out_file
getDistributeHost out_file lsf.log
```

**Note:** Use the above two commands together to save the LSF information in the specified file.

## Local

The following command runs all distributed processing jobs on the machine on which you are running the master version of the software:

```
set_distributed_hosts -local
```

## Custom

The following command runs distributed processing with a custom script:

```
set_distributed_hosts -custom -custom_script {bsub -q bigQueue -x -R "OS==Linux &&
memory>20000"}
```

The following command runs distributed processing with a custom script list:

```
set_distributed_hosts -custom -custom_script_list {{{bsub -P ICD -W 2 -q admin -R
"OSNAME==Linux && OSREL==EE50"}1} {{rsh hpc1 -e} 1}}
```

## Examples

- The following command allows the Tempus client to source the `my_env_file` before start up on the same machine:

```
set_distributed_hosts -local -env_script my_env_file
```

This command allows the master to pass on the user-defined environment settings.

- The following command allows the Tempus client to run using the LSF:

```
set_distributed_hosts -lsf -noWaitTaskComeUp
```

When the `-noWaitTaskComeUp` parameter is specified, the Tempus software will not wait for all the clients to come up when parts of the clients are launching timeout.

## Related Commands

- `get_distributed_hosts`

# set\_multi\_cpu\_usage

```
set_multi_cpu_usage
[-help]
[-acquire_license integer]
[-auto_page_fault_monitor {0 | 1 | 2 | 3}]
[-cpu_per_remote_host integer]
[-keep_license {true | false}]
[-license_list string]
[-local_cpu string]
[-release_license]
[-remote_host integer]
[-reset]
[-thread_info {0 | 1 | 2}]
[-verbose]
```

Specifies the number of threads to use for multi-threading, or the maximum number of computers to use for distributed processing, or the maximum number of computers and the number of threads to use for Superthreading. Optionally, reports usage information.

 This command is required for multi-threading, distributed processing, and Superthreading.

The `set_multi_cpu_usage` command enables multi-threaded timing reporting under the following conditions:

- `timing_report_group_based_mode` attribute is set to `true`. If there are multiple paths with the same slack then the selection can change on multiple runs. This may result in some changes in the `report_timing` output.
- `report_analysis_coverage` command is in non-verbose mode.
- `check_timing -include clock_crossing` parameter is specified.

| <p><code>-local_cpu {integer   max}</code></p> | <p>Specifies the number of CPUs on a local machine. When the <code>-localcpu</code> parameter is set to 1 (default), the multi-threaded timing propagation mode is enabled. Also, both CPU multi-threading and distributed process are enabled.</p> <p>The <code>set_multi_cpu_usage -localCpu</code> command automatically controls the total number of threads used up to the specified number. The number of specified threads cannot be more than the number of CPUs available in the local computer. Consider a computer having 8 CPUs, then the following command will issue a warning that the number of specified local CPUs is greater than the actual number of CPUs available:</p> <pre>set_multi_cpu_usage -localCpu 10</pre> <p>The local CPU count can be the maximum value that is shown as “processors” on the system under “/proc/cpuinfo”. This value can be obtained by running the “checkSysConf” utility in the “tools/bin” folder.</p> <pre>\$&gt; tools/bin/checkSysConf ===== checkSysConf: Version 3.53 ===== OS Version .....: Red Hat Enterprise Linux Workstation release 7.6 (Maipo) Kernel Version .....: 3.10.0-957.5.1.el7.x86_64 Hardware Type .....: x86_64 Memory .....: 2063415 Megabyte CPU model .....: Intel(R) Xeon(R) Gold 6254 CPU @ 3.10GHz <b>No. of CPUs .....: 72</b> Total Swap Space.....: 131072 Megabyte =====  \$&gt; cat /proc/cpuinfo   grep "processor"   tail -1   awk -F ":" '{print \$2 + 1}' 72  <i>Default: 1</i> </pre> |
| <p><code>-release_license</code></p>           | <p>Releases all multiple-CPU license(s) immediately. By default, the software holds multiple-CPU licenses until the end of the current session.</p> <p>To specify that the software release multiple-CPU licenses after every multiple-CPU command runs, use <code>-keep_license</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p><code>-remote_host integer</code></p>       | <p>Specifies the number of remote machines. This parameter is required for distributed processing and Superthreading.</p> <p><i>Default: 0</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <code>-reset</code>                   | Resets the specified parameters back to default values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>-thread_info {0   1   2}</code> | <p>Reports usage information.</p> <p>This parameter works for multi-threading only.</p> <p><i>Default:</i> 0</p> <p>Specify one of the following values:</p> <p>0: Does not write messages to the log file.</p> <p>1: Writes the final message to the log file.</p> <p>For example,</p> <p>All threaded jobs finished (10 elapsed sec: 0 processor sec (parent), 0 system sec (parent), 0 processor sec (threads), 0 system sec (threads)).</p> <p>2: Writes additional starting/ending information for each thread.</p> <p>For example,</p> <pre>Starting threaded job 1... Starting threaded job 2... Starting threaded job 3... Ending threaded job 2 (1 elapsed sec, 0 processor sec, 0 system sec, 1.160M). Ending threaded job 3 (2 elapsed sec, 0 processor sec, 0 system sec, 0.895M). Ending threaded job 1 (10 elapsed sec, 0 processor sec, 0 system sec, 1.172M). All threaded jobs finished (10 elapsed sec: 0 processor sec (parent), 0 system sec (parent), 0 processor sec (threads), 0 system sec (threads)).</pre> <p><b>Note:</b> This parameter works in multi-threading mode only.</p> |
| <code>-verbose</code>                 | Displays messages when changing the multiple-CPU settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Examples

Here are some examples.

- The following command specifies that 8 CPUs can be used on a local machine for multi-threading. This is based on the assumption that 8 CPUs are available on the local machine; otherwise the software will utilize the available CPUs:  
tempus > set\_multi-cpu\_usage -localCpu 8
- The following command specifies that the number of remote machines to be used is 4 for

distributed processing, and also for each of these hosts, 4 CPUs will be used for super threading:

```
tempus > set_multi_cpu_usage -remoteHost 4 -cpuPerRemoteHost 4
```

Here, during DMMMC analysis, in total 16 analysis sessions can be run in parallel.

In addition, multi-CPU configuration settings for distributed processing must be done using the `set_distributed_hosts` command.

- The following command releases all the multi-CPU licenses immediately:

```
tempus > set_multi_cpu_usage -releaseLicense
```

## compare\_oa\_cellview

```
compare_oa_cellview
[-help]
[-ignore {pin_purpose}]
[-out_file report_file_name]
{ {{-source {from_lib from_cell from_view} -compare {to_lib to_cell to_view}} | {-lib lib -
cell cell -view {sourceView compareView}}} }
```

Compares specified cell views. Use this command to compare two OpenAccess databases. For instance, you can use this command to compare the lib/cell/view specified using `-source` to the lib/cell/view specified with `-compare`. In an abstract to layout comparison, boundary and terminals (name, direction, pin location and size) are compared. [This command can be used without design import.](#)

## Parameters

## Examples

- The following command compares two views of the same cell that are present in the same library `zambezi45` and writes the report to the `test1a` file:

```
compare_cellview -source {zambezi45 pll_vcdiv layout} -compare {zambezi45
pll_vcdiv abstract} -out_file test1a
```

A sample output is displayed below:

```

Compare_cellview comparison #

Source Design : 'zambezi45/pll_vcdiv/layout' is identified as layout design
Compare Design : 'zambezi45/pll_vcdiv/abstract' is identified as abstract design

Source Design seems to have been modified after the Compare Design has been created

Compare Celltype

Source Design has celltype 'none' & Compare Design has Celltype 'block'

Compare Cell Boundary

Source Design has different PRBoundary than Compare Design

Compare Terminals

Source Design has Pin 'en' which has Port with shape (36.215 0 36.355 0.14) on layer
'Metal5' and purpose 'pin' is not present in Compare Design
Compare Design has Pin 'en' which has a Port with shape (36.215 0 36.36 0.14) on layer
'Metal5' and purpose 'net' is not present in Source Design
...

Antenna Information

Antenna Information is defined for Pin 'en' in Compare but not defined in Source Design
Antenna Information is defined for Pin 'vcocalen' in Compare but not defined in Source
Design
...

Source Design is not equivalent to Compare Design
```

- The following command compares the views `fplan1` and `fplan2` of the library `DesignLib` and the cell `myAlu`:

```
compare_oa_cellview -source {DesignLib myAlu fplan1} -compare {DesignLib myAlu fplan2}
```

## create\_oa\_lib

```
create_oa_lib
[-help]
oa_lib
[-out_dir path]
[-no_compress]
{-oa_attach_tech_lib techlib |
-oa_copy_tech_lib techlib |
-oa_reference_tech_libs techliblist}
```

Copies or attaches a technology database to a library. If the library exists, this command does not update the library.

**Note:** The parameters must appear in the order specified by the syntax.

The `create_oa_lib` command is part of the OpenAccess design flow. Use this command to create an OpenAccess library at the specified path. `create_oa_lib` needs to be called only once before the design is saved. Subsequent `saveDesign` calls to the same library will automatically find out the library path that gets stored in `cds.lib`.

## Parameters

|                                                  |                                                                                                                                                                                                                                                                            |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-help</code>                               | <p>Outputs a brief description that includes type and default information for each <code>create_oa_lib</code> parameter.</p> <p>For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man create_oa_lib</code>.</p> |
| <code>oa_lib</code>                              | Specifies the name of a library to be created. The software creates the library and adds its name to the <code>cds.lib</code> file.                                                                                                                                        |
| <code>-out_dir path</code>                       | <p>Specifies the name of a directory in which to save the library. The path you specify must include the directory that will become the library itself.</p> <p><i>Default:</i> <code>./ oa_lib</code> (Saves the library to the current working directory)</p>             |
| <code>-no_compress</code>                        | Creates a new library without any compression irrespective of the compression settings provided by the <code>setOaxMode</code> command.                                                                                                                                    |
| <code>-oa_attach_tech_lib techlib</code>         | Attaches the technology database specified by the technology library to the library that is to be created.                                                                                                                                                                 |
| <code>-oa_copy_tech_lib techlib</code>           | Copies the technology database specified by <code>techLib</code> to the library specified by <code>oa_lib</code> , and saves the library to the current working directory.                                                                                                 |
| <code>-oa_reference_tech_libs techliblist</code> | Creates a local technology database in the design library that can be modified incrementally.                                                                                                                                                                              |

## Examples

- The following command creates the library `myLib` in the current directory, and attaches the technology database in `myRefLib` to `myLib`:

```
create_oa_lib myLib -oa_attach_tech_lib myRefLib
```

**Note:** Note: If `myRefLib` is read-only, the `saveDesign -cellview` command generates an error if it needs to update the technology database.

- The following command creates the library `TEST_LIB` at the specified path, and attaches the technology database in `TEST_REF_LIB` to `TEST_LIB`:

```
create_oa_lib TEST_LIB -out_dir ./outputs/TEST_LIB -oa_attach_tech_lib TEST_REF_LIB
```

- The following command generates an error because only one reference library can be specified:

```
create_oa_lib myLib -oa_attach_tech_lib {myRefLib1 myRefLib2}
```

- The following command creates the library `myLib`, and copies the technology database from `myRefLib` to `myLib`. If `myRefLib` is modified, the two technology databases will become out of sync. Additionally, any future write operations from the `saveDesign -cellview` command will modify the technology database copy in `myLib` and also cause the databases to be out of sync.

```
create_oa_lib myLib -oa_copy_tech_lib myRefLib
```

- The following command creates a new library which references existing technology databases (`refLib1` and `refLib2`), but allows local technology updates if required (typically to add new custom vias to the local technology database).

```
create_oa_lib myLib -oa_reference_tech_libs {refLib1 refLib2}
```

## create\_oa\_lib\_property

```
create_oa_lib_property
[-help]
-oa_lib libName
-name prop_name
-type {boolean integer float string}
-value propValue
```

Adds a new property to the OpenAccess library, *oalib*. This command cannot be used to change the value of an existing property.

**Note:** You cannot use the name *techLibName* for the property you are adding because this name is used by the OpenAccess infrastructure to store the property attached to the library.

### Parameters

|                                      |                                                                                                                                                                                                                                                                                       |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -help                                | Prints a brief description that includes type and default information for each <code>create_oa_lib_property</code> parameter.<br><br>For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man create_oa_lib_property</code> . |
| -oa_lib <i>libName</i>               | Specifies the name of the OpenAccess library to which the property has to be added.                                                                                                                                                                                                   |
| -name <i>prop_name</i>               | Specifies the name of the property being created.                                                                                                                                                                                                                                     |
| -type {boolean integer float string} |                                                                                                                                                                                                                                                                                       |
|                                      | Specifies the type of the property being created.                                                                                                                                                                                                                                     |
| -value <i>propValue</i>              | Specifies the value to be set for property being created. The value is interpreted from the input string and converted to the specified type.                                                                                                                                         |

### Example

In Tempus, the following set of commands creates a library named *myLib*, adds the *prop1* property to it, and saves the design before exiting:

```
createLib myLib -attachTech adiTech
add_oa_lib_property -oa_lib myLib -name prop1 -type string -value value1
saveDesign -cellview {myLib block1 layout}
exit
```

You can now add more properties to the library in Virtuoso. When you restore the design in Tempus, all properties previously added to the library, whether in Tempus or Virtuoso, reflect correctly.

## Related Information

## get\_oa\_default\_rule\_lib

```
get_oa_default_rule_lib
[-help]
[-rule rule_name]
[-libs lib_list]
[-verbose]
```

Searches through a specified library (or libraries) to check whether a specified LDRS exists or not. You can run this check before reading a library.

## Parameters

|                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <code>-rule <i>rule_name</i></code> | <p>Specifies the name of the rule to find.</p> <p>If not specified, the <code>init_oa_default_rule</code> attribute is used. If the attribute has an empty string value, the standard lookup (LEFDefaultRouteSpec by type, then by name) is used.</p> <p>If the specified <code>rule_name</code> does not exist, the command displays an error such as:</p> <pre>Rule '&lt;rule_name&gt;' was not found in specified libraries.</pre> <p>If the specified <code>rule_name</code> is found, the command returns the name of the library where the specified <code>rule_name</code> was found. This could be from the <code>-libs <i>lib_list</i></code> or any ITDB that one of those libraries refers to.</p> <p>If the specified <code>rule_name</code> is found but is not a legal LDRS type as determined by the OAX reader code, the command displays an error such as:</p> <pre>Constraint group '&lt;rule_name&gt;' was found in library<br/>'&lt;lib_name&gt;', but is not a legal LEFDefaultRouteSpec</pre> |
| <code>-verbose</code>               | <p>Echoes details of library name where the rule was found (including descending through technology references from libraries specified in the <code>lib_list</code>).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Examples

- The following example shows how `get_oa_default_rule_lib` can be used to search for a specific library and the graph of techs that it references:

```
set_db init_oa_ref_libs "tech_lib macro_lib"
set_db init_oa_default_rule LDRS_65nm_6lm
set tech_lib [lindex $init_oa_ref_libs 0]
set lib_found [get_oa_default_rule_lib -libs $tech_lib] # use the init_oa_default_rule
to look up the library
if {$lib_found != ""} {
 Puts "$init_oa_default_rule was found in $lib_found or in the graph of libraries that
 $tech_lib references"
} else {
 Puts "$init_oa_default_rule was not found in $tech_lib nor in the graph of libraries
 that $tech_lib references"
}
```

- The following command shows how the `-verbose` option can be used:

```
get_oa_default_rule_lib -verbose
INFO: Default rule 'LEFDefaultRouteSpec' was found in library 'FEOAreflib8'.
FEOAreflib8
```

## Related Information

- [init Category Attributes](#)

# get\_oa\_design\_data

```
get_oa_design_data
[-help]
{{-all_oa_libs} | {{-design_data dd_objHandle | -oa_lib libName | -oa_cell {lib cell} | -
oa_cellview {lib cell view}}
[-children | -file | -path | -type | -name]]}
```

Returns OpenAccess library information.

## Parameters

|                                 |                                                                                                                                                |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| -all_oa_libs                    | Returns a list of design data (dd) object handles for the list of libraries present in the library definition file (cds.lib).                  |
| -children                       | Returns the dd object handles of the children of the specified dd object handle. Children of libraries are cells. Children of cells are views. |
| -design_data<br>dd_objHandle    | Specifies the dd object to be processed.                                                                                                       |
| -file                           | Returns the dd object handles of all the files in the specified dd object handle.                                                              |
| -name                           | Returns the name of the specified dd object handle.                                                                                            |
| -oa_cell {lib<br>cell}          | Specifies the names of the library and cell to be processed.                                                                                   |
| -oa_cellview<br>{lib cell view} | Specifies the names of the library, cell, and view to be processed.                                                                            |
| -oa_lib libName                 | Specifies the name of the library to be processed.                                                                                             |
| -path                           | Returns the absolute path name (dd path) of the specified dd object handle.                                                                    |
| -type                           | Returns the type of the specified dd object handle.                                                                                            |

## Examples

- The following command returns the path of the specified library/cell/view as shown below:

```
get_oa_design_data -cellview {pdkLib cell1 abstract} -path
```

returns:

```
/libs/pkdLib/cell1/abstract
```

This command is equivalent to the following SKILL function:

```
ddGetObjReadPath(ddGetObj("pdkLib" "cell1" "abstract"))
```

- The following proc traverses the cds.lib structure (expanding #INCLUDE as required) to get the complete list of OpenAccess libraries and their full paths.

```
expand #INCLUDE as needed and print all libraries and their full paths
proc print_all_lib_paths {} {
 Puts [format "%16s -> %s" "Library Name" "Library Path"]
 Puts "-----"
 foreach oa_lib [get_oa_design_data -all_oa_libs] {
 Puts [format "%16s -> %s" [get_oa_design_data -design_data $oa_lib -name]
[get_oa_design_data -design_data $oa_lib -path]]
 }
}
```

## oa\_read\_write Category Attributes

The root attributes in the `oa_read_write` category are:

- `oa_allow_analysis_only`
- `oa_allow_bit_connection`
- `oa_allow_tech_update`
- `oa_bindkey_file`
- `oa_cell_view_dir`
- `oa_convert_diagonal_path_to`
- `oa_cut_rows`
- `oa_display_resource_file`
- `oa_display_resource_file_in_library`
- `oa_drc_fill_purpose`
- `oa_enclose_quick_abstract_pins`
- `oa_full_layer_list`
- `oa_full_path`
- `oa_hybrid_rows`
- `oa_inst_placed_if_none`
- `oa_lib_create_mode`
- `oa_lock`
- `oa_logic_only_import`
- `oa_merge_trim`
- `oa_new_lib_compress_level`
- `oa_non_rectilinear_shapes`
- `oa_pin_purpose`
- `oa_push_pin_constraint`
- `oa_quick_abstract_for_custom_cells`
- `oa_read_system_reserved_layers`
- `oa_silently_ignore_unsupported_vias`
- `oa_text_purpose`

- [oa\\_tie\\_net](#)
- [oa\\_update\\_mode](#)
- [oa\\_use\\_virtuoso\\_bindkey](#)
- [oa\\_use\\_virtuoso\\_color](#)
- [oa\\_view\\_sub\\_type](#)
- [oa\\_write\\_cds\\_fixed\\_vias](#)
- [oa\\_write\\_mask\\_data\\_locked](#)
- [oa\\_write\\_net\\_voltage](#)
- [oa\\_write\\_relative\\_path](#)

To set the value of any root attribute, use the [set\\_db](#) command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the [get\\_db](#) command:

```
get_db attribute_name
```

To get the current value of all attributes in the `oa_read_write` category, use the following command:

```
get_db -category oa_read_write
```

## **oa\_allow\_analysis\_only**

```
oa_allow_analysis_only {true | false}
```

*Default:* false

*Data\_type:* Boolean

Allows analysis only flow.

`assemble_design` is not allowed when `oa_allow_analysis_only` is set to `false` and `oa_update_mode` is set to `true`, thereby locking the OpenAccess database. To allow `assemble_design` to proceed, you must change `oa_allow_analysis_only` to `true`. If you set `oa_allow_analysis_only` to `true` and the Tempus session is in `oa_update_mode = true` mode (whether set explicitly or internally on the fly), the `oa_update_mode` setting is ignored.

Note that there may be loss of some semantic information, such as MPPs, while saving the design when `oa_allow_analysis_only` is set to `true`. However, the saved design would be geometrically correct.

## oa\_allow\_bit\_connection

oa\_allow\_bit\_connection {true | false}

*Default:* false

*Data\_type:* Boolean

Creates databases for instances that only have bit-based terminals, without requiring the corresponding bus terminals.

When set to `true`, it saves the connectivity information by bits if the bus connections are not available.

When set to `false`, an error will be issued if the abstract view is missing expected bus terminal information.

## oa\_allow\_tech\_update

oa\_allow\_tech\_update {true | false}

*Default:* true

*Data\_type:* Boolean

Allows the technology database to be updated. The common reason that a technology database would need to be updated is that new vias have been added to the design that are not in a parameterized form. Via masters that are a simple list of rectangles require that a "custom via" be created in the technology database. If the design library had been created with an attached technology, the value should be set to `false` allowing a reference library technology that is shared by multiple designs to have design specific vias to be added to it. For design libraries that have been created in reference mode, allowing the technology database to be updated is typically fine but normally it is best to always use parameterized vias for OpenAccess-based flows.

Using `set_db generate_special_via_symmetrical_via_only true` before any power planning or routing will typically prevent the creation of non-parameterized vias in the flow.

When `oa_allow_tech_update` is set to `false`, the creation of the OpenAccess database will fail if any custom vias would need to be created within the design library.

## Related Commands and Attributes

`generate_special_via_symmetrical_via_only`

## oa\_bindkey\_file

oa\_bindkey\_file *fileName*

*Default:* ""

*Data\_type:* String

Maps into Tempus equivalent bindkeys. If the bindkey file is not specified, the Virtuoso default bindkey information is used. This attribute must be used with the `oa_use_virtuoso_bindkey` attribute.

## Related Commands and Attributes

`oa_use_virtuoso_bindkey`

## oa\_cell\_view\_dir

`oa_cell_view_dir` *string*

*Default:* ""

*Data\_type:* String

Specifies the path name to the physical location of the lib/cell/view that was restored using `read_db - oa_lib_cell_view`. `oa_cell_view_dir` is a system-defined, transient (non-persistent) attribute used in the OpenAccess flow. This should be treated as a *read-only* attribute.

## Related Commands

`read_db`

## oa\_convert\_diagonal\_path\_to

`oa_convert_diagonal_path_to` {polygon | default\_style}

*Default:* polygon

*Data\_type:* Enum

Enables interoperability of the end style of geometries of type path segment between Virtuoso and Tempus.

This attribute applies to the diagonal path segments only.

If the end-style of a diagonal path segment is `custom`, then the end style is retained as is.

If the end style of a diagonal path segment is not `custom`, then if you set the value to `polygon`, Tempus converts the path segment into a geometrically equivalent polygon.

If the value specified is `default_style`, then the end style of the path segment is set to `default_style`. In this case, Tempus retains the semantics of the object to be a path segment.

**Important:** To ensure that there is no loss of semantic or geometric information, the path segments in Virtuoso -XL and Virtuoso-GXL should use the `custom` end-style on diagonal path segments which can be created using *Create-Shape-Geometric Wire*.

## oa\_cut\_rows

oa\_cut\_rows {true | false}

*Default:* false

*Data\_type:* Boolean

Cuts rows against placement obstructions, block halos, or power domain fence minimum gaps.

The following command cuts rows against placement obstructions, block halos, or power domain fence minimum gaps:

```
set_db oa_cut_rows true
```

## oa\_display\_resource\_file

oa\_display\_resource\_file *pathName*

*Default:* ""

*Data\_type:* String

Allows you to specify a specific `display.drf` file that is to be used. It overrides all the searching options and the specified file is used.

The following command searches for the `mydisplay.drf` file irrespective of the value of the `oa_display_resource_file_in_library` attribute:

```
set_db oa_display_resource_file /servers/oastore/mydisplay.drf
```

## oa\_display\_resource\_file\_in\_library

oa\_display\_resource\_file\_in\_library {true | false}

*Default:* false

*Data\_type:* Boolean

Allows the tool to search for the `display.drf` file in the technology library (or complete technology graph in case of ITDB) when set to `true`. If not found, it looks for the file in the current working directory followed by the home directory.

When set to `false`, the tool searches for the `display.drf` file first in the current working directory followed by the home directory.

## oa\_drc\_fill\_purpose

oa\_drc\_fill\_purpose {gap\_fill | drawing}

*Default:* `gap_fill`

*Data\_type:* Enum

Specifies whether to save DRCFILL shapes to the `gap_fill` or `drawing` purpose. By default, DEF routes with + SHAPE DRCFILL are mapped to the `gapFill` purpose in OpenAccess. However, some OpenAccess tech files do not have this purpose defined so any shapes mapped to the `gapFill` purpose would not be visible in Virtuoso and would not be written out in GDS or OASIS. In such cases, set the `oa_drc_fill_purpose` attribute to `drawing` to save these shapes to the `drawing` purpose. When you do so, these shapes get an additional internal attribute so they can round-trip back to DRCFILL shapes properly.

## **oa\_enclose\_quick\_abstract\_pins**

```
oa_enclose_quick_abstract_pins {true | false}
```

*Default:* `true`

*Data\_type:* Boolean

Includes shapes that enclose layout pin shapes.

## **oa\_full\_layer\_list**

```
oa_full_layer_list {true | false}
```

*Default:* `true`

*Data\_type:* Boolean

Imports the complete list of OpenAccess layers, when importing an OpenAccess design.

If you specify `false`, only OpenAccess layers defined with `oacMaterial` and `type` are imported.

## **oa\_full\_path**

```
oa_full_path {true | false}
```

*Default:* `false`

*Data\_type:* Boolean

Creates the `DEFINE` statements in the `lib.def` files using full paths. If you specify `-oa_full_path false`, the software creates the statements using relative paths.

The following command instructs the Tempus software to create the `DEFINE` statements using full paths:

```
set_db oa_full_path true
```

## oa\_hybrid\_rows

`oa_hybrid_rows {true | false}`

*Default:* false

*Data\_type:* Boolean

Reads hybrid rows from the Process Design Kit (PDK). When this attribute is set to `true`, the tool checks whether the sites are abutted horizontally or vertically and calculates the complex site width and height accordingly.

## oa\_inst\_placed\_if\_none

`oa_inst_placed_if_none {true | false}`

*Default:* true

*Data\_type:* Boolean

Maps the placement status of instances in the OpenAccess database to the placement status in the Tempus software. When set to `true`, the instances in the OpenAccess database that have an unknown placement status are treated as "placed" in the Tempus software. When set to `false`, instances with an unknown placement status are treated as "unplaced."

## oa\_lib\_create\_mode

`oa_lib_create_mode {none | attach | copy | reference}`

*Default:* reference

*Data\_type:* Enum

Specifies the mode in which `write_db -oa_lib_cell_view` creates a library.

- `none`: Turns off the ability to have `write_db` create a library if it does not already exist.
- `attach`: Attaches the technology database specified by the technology library to the library that is to be created.
- `copy`: Copies the technology database specified by `techLib` to the library specified by `libName`, and saves the library to the current working directory.
- `reference`: Creates a local technology database in the design library that can be modified incrementally. This is the recommended setting to handle the case where the design may have "custom vias" added at some point by power planning/routing.

## Related Commands

- `write_db`

## oa\_lock

`oa_lock {true | false}`

*Default:* `false`

*Data\_type:* **Boolean**

Locks the OpenAccess database when restoring the design. When set to `true`, other tools can still access the OpenAccess database in read-only mode, but cannot edit the database as long as it is locked for the Tempus session. To remove the lock, specify the `reset_design` command, or exit the Tempus software.

## Notes

- If you set the `oa_update_mode` attribute to `true`, the software automatically locks the database, even if the `oa_lock` attribute is set to `false`.
- The value of `oa_lock` cannot be changed while a design is in memory.

## Related Commands

- `unlock_oa_design`

## oa\_logic\_only\_import

`oa_logic_only_import {true | false}`

*Default:* `false`

*Data\_type:* **Boolean**

Controls what information the software reads when importing an OpenAccess maskLayout database.

When set to `true`, the software reads only the logical (Verilog netlist equivalent) connectivity during the `init_design` process. When set to `false` (the default value), the software automatically reads physical information, such as floorplan, placement, and routing, from the database, and updates physical net connectivity for power and ground connections.

**Note:** The `oa_logic_only_import` attribute applies only to OpenAccess maskLayout databases. For other types of OpenAccess databases, the software always reads only the logical connectivity.

## Related Commands

- `init_design`

## oa\_merge\_trim

`oa_merge_trim {true | false}`

*Default:* `true`

*Data\_type:* `Boolean`

Merges the trim metal shapes during save when the trim metal gap is less than or equal to the `max_gap` in microns.

## oa\_new\_lib\_compress\_level

`oa_new_lib_compress_level value`

*Default:* `1`

*Data\_type:* `Integer`

Sets the compression level of a library during the library creation process. Cellviews written to a library will follow the compression level of the library and not the current `oa_new_lib_compress_level` setting.

Valid values range between 0 to 9. A value of 0 indicates that compression is turned off.

## Related Commands

- `create_oa_lib`

## oa\_non\_rectilinear\_shapes

`oa_non_rectilinear_shapes {bbox | approximate}`

*Default:* `bbox`

*Data\_type:* `Enum`

Translates non-rectilinear shapes to rectilinear shapes while reading in an OpenAccess design:

- `approximate` - Converts non-rectilinear shapes into approximate stepped rectilinear shapes.

- `bbox` - Converts non-rectilinear shapes into bounding box shapes.

## Related Commands

- `read_oa`

## oa\_pin\_purpose

`oa_pin_purpose {true | false}`

*Default:* `false`

*Data\_type:* `Boolean`

Writes out pin shapes with the purpose `pin`. When set to `false`, writes out pin shapes with the purpose `drawing`.

## oa\_push\_pin\_constraint

`oa_push_pin_constraint {true | false}`

*Default:* `false`

*Data\_type:* `Boolean`

Specifies whether or not `write_db` should push an interoperable pin constraint into its corresponding blackbox abstract cellview.

**Note:** Interoperable pin constraints refer to pin constraints that are understood by Tempus, Virtuoso, and PVS.

## Related Commands

`write_db`

### **oa\_quick\_abstract\_for\_custom\_cells**

```
oa_quick_abstract_for_custom_cells {pcells stdcells all off}
```

*Default:* `all`

*Data\_type:* `Enum`

Trims design shapes of custom cells. By default, this capability is turned on for all types of custom cells. The following settings are allowed for this attribute:

- `pcells` - Trims design shapes of only custom parameterized cells (PCells).
- `stdcells` - Trims design shapes of only custom standard cells.
- `all` - Trims design shapes of all custom cells.
- `off` - Does not trim design shapes of any custom cell.

 This feature needs the INVS30 (Innovus Mixed Signal Option) license. If this license is not available, the abstract that gets generated for custom cells will not work properly in Innovus.

### **oa\_read\_system\_reserved\_layers**

```
oa_read_system_reserved_layers {all | text | off}
```

*Default:* `all`

*Data\_type:* `Enum`

Reads the system-reserved layers from the PDK. The following settings are supported:

- `all` - All system-reserved layers are read.
- `text` - Only text layer is read.
- `off` - No system-reserved layer is read.

### **oa\_silently\_ignore\_unsupported\_vias**

```
oa_silently_ignore_unsupported_vias {true | false}
```

*Default:* `false`

*Data\_type:* `Boolean`

Specifies whether `read_db` should issue messages about vias that are not supported in Tempus when a Virtuoso design is read in.

## oa\_text\_purpose

`oa_text_purpose purpose_name`

*Default:* `drawing`

*Data\_type:* `String`

Specifies the purpose name that will be used when text labels are written.

By default, any text label created in Tempus (typically via the `create_text` command) is automatically mapped to the `drawing` purpose. Use the `oa_text_purpose` attribute to map the text labels to a user-defined purpose.

**Note:** `oa_text_purpose purpose_name` overrides the default `drawing` purpose on output.

## oa\_tie\_net

`oa_tie_net {tieHighNetName tieLowNetName}`

*Default:* `""`

*Data\_type:* `String`

If these names exist in the design locally in any module, then the global names should be changed.

Specifies the global tie high and tie low net names to be created in the OpenAccess database. The nets are used to represent the Verilog `1'b1/1'b0` connections to the instance ports.

## oa\_update\_mode

`oa_update_mode {true | false | auto}`

*Default:* `false`

*Data\_type:* `Enum`

Ensures that `read_db -oa_lib_cell_view` processes parameterized cells (PCells) and other custom objects correctly in the Tempus database. For information about generating/regenerating the PCell cache, refer to the "Preparing the IP Library" section in the "Technology Data Preparation" chapter of the *Mixed Signal (MS) Interoperability Guide*.

The `oa_update_mode` attribute also ensures that `write_db -oa_lib_cell_view` updates the Tempus-modified portion of an OpenAccess database without making changes to PCells or other custom objects.

 In the `oa_update_mode true` mode, the tool locks the source cellview for the duration of the session.

This attribute provides the ability to import OpenAccess database created from Virtuoso that contains objects which are not understood by Tempus. Complete the digital part in Tempus and update only the objects modified by Tempus in the original OpenAccess database. If your design has any of the following objects, they would only be visible (not editable) in Tempus:

- Pcells
- Modgen cells
- Fig-groups
- Pcell vias
- RODs (Example, Multi-Part Paths, and so on)
- User defined properties on design objects such as nets, shapes (`lxStickyNet`), instances, abstract views, intermediate hierarchical instances, and so on.

You won't be allowed to edit or modify these objects.

On using the `oa_update_mode` attribute, the property on shapes (for example, `lxStickyNet`) and nets created in VLS-XL / GXL would be kept as-is.

In case of designs where parameterized vias are used, Tempus understands these attributes and evaluates them on-the-fly to create an exact shape and orientation of the cuts.

If the `oa_update_mode` attribute is set to `auto` and the cellview contains objects that are not supported in Tempus, the software internally enables update mode with a message such as follows:

INFO: Objects have been found in the cellview requiring updateMode to be enabled so that there is no loss of semantic information when the cellview is saved.

Note that enabling update mode can affect `write_db` performance.

## Notes

- The value of the `oa_update_mode` attribute cannot be changed while a design is in memory. After this attribute has been set to `true` before importing an OpenAccess design into Tempus, you cannot convert the `oa_update_mode` attribute to `false` in any new Tempus session.
- The on-disk OpenAccess cellview is locked between the restore and save steps when the `oa_update_mode` attribute is set to `true`.
- In `oa_update_mode auto`, the lock is applied at the time that `read_oa` or `read_db - oa_lib_cell_view` starts and released at the end of the command if no objects were encountered that required updateMode to be enabled.

## oa\_use\_virtuoso\_bindkey

oa\_use\_virtuoso\_bindkey {true | false}

*Default:* false

*Data\_type:* Boolean

Allows you to use Virtuoso bindkeys.

## oa\_use\_virtuoso\_color

oa\_use\_virtuoso\_color {true | false}

*Default:* false

*Data\_type:* Boolean

Allows you to display colors and stipples for the design layers (including full custom layers). Using this attribute, Tempus utilizes the same colors and stipples that you would see if you open the design in Virtuoso.

## oa\_view\_sub\_type

oa\_view\_sub\_type {vce | vx1 | none}

*Default:* vx1

*Data\_type:* Enum

Indicates which Virtuoso application should be used for viewing the layout cellviews in the saved OpenAccess database.

When set to `vce`, cellviews are opened in Virtuoso Chip Editor.

When set to `vx1`, cellviews are opened in Virtuoso XL.

When set to `none`, it indicates that the OpenAccess database can be edited by any editor within Virtuoso platform based on its license availability.

## oa\_write\_cds\_fixed\_vias

oa\_write\_cds\_fixed\_vias {new\_vias\_only | off}

*Default:* new\_vias\_only

*Data\_type:* enum, read/write

Controls how fixed vias are created when saving a design with custom vias from Innovus to OpenAccess:

- `new_vias_only` - Any newly created custom via is saved as a fixed via while any pre-existing custom via in the Incremental Technology Database (ITDB) is reused when saving the design.
- `off` - No `cdsFixedVias` are created. All fixed/custom vias in the design are saved as `oaCustomVia`.

 This feature needs the Mixed Signal Option license. If this license is not available, the `off` value will be used and no fixed vias will be created.

## `oa_write_mask_data_locked`

`oa_write_mask_data_locked {true | false}`

*Default:* `false`

*Data\_type:* Boolean

Sets the shapes with mask coloring (mask values other than 0) to locked in the saved cellview, when set to `true`.

By default, `write_db` write out shapes with their mask coloring information in an unlocked state. Some tools treat the unlocked color information as the recommended color. However, for some foundry processes, shapes with unlocked mask coloring information are written to GDSII/Stream as gray (uncolored). In such cases, set the `oa_write_mask_data_locked` parameter to `true` to lock the mask coloring of shapes explicitly.

**Note:** This option affects only the saving of shapes with non-zero mask coloring values. Review the map file that will be used to create GDSII/Stream output from the OpenAccess cellview to determine if the map file requires shapes to be locked for them to be written out as colored.

## Related Commands

- `write_db`

## `oa_write_net_voltage`

`oa_write_net_voltage {true | false}`

*Default:* `false`

*Data\_type:* Boolean

Saves the minimum and maximum net voltage across all loaded timing views to every net. This is useful for Virtuoso, and other tools that may read the cellview, to understand the minimum and maximum net voltage without needing to interpret the CPF or .lib file to get that information. The round-trip of the information into Tempus is not dependent on this setting.

## oa\_write\_relative\_path

```
oa_write_relative_path {true | false}
```

*Default:* `true`

*Data\_type:* **Boolean**

Specifies whether or not to save the relative path in the configuration file. Defines the current working directory (`$cwd`) in the configuration file as `". "`. When set to `true`, a design can be restored, even if the directory path of the design file is changed.

## read\_oa

```
read_oa
[-help]
oa_lib
oa_cell
oa_view
[-filter {block_insts blockages boundary fixed_core_insts floorplan pad_insts pin_shapes
regions regular_routing special_routing}]
[-nets { netnames }]
```

Restores floorplan, placement, and routing data using the OpenAccess format. This command only reads physical information from the OpenAccess database. For information on restoring an OpenAccess database, see [read\\_db](#).

You can use the `read_oa` command after importing the design.

**Note:** Tempus supports only the following begin/end extension values for DEF `NETS` style wiring segments: 0, width/2 or LEF `LAYER WIREEXTENSION`. If any of the wire extensions has unsupported extension value, then Tempus converts it to a special wire (DEF `SPECIALNETS`). While writing back OpenAccess (`write_oa` or `write_db -oa_lib_cell_view`), these special wires will again be converted back to DEF `NETS` style wiring.

## Parameters

|                      |                                                                                                                                                                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-help</code>   | Outputs a brief description that includes type and default information for each parameter of the <code>read_oa</code> command.<br><br>For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man read_oa</code> . |
| <code>oa_lib</code>  | Specifies the OpenAccess library name.                                                                                                                                                                                                                                  |
| <code>oa_cell</code> | Specifies the name of the top cell to import.                                                                                                                                                                                                                           |

|                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                               | connectivity does not match the current in-memory connectivity of the tool. The <code>-filter</code> option allows you to load some data selectively, while not loading others. When <code>-filter</code> is used, error checking for database consistency (nets, instances, terminals, etc.) is disabled. While similar to Virtuoso Load Physical View (LPV), the <code>-filter</code> option is only a subset and not intended to be a complete replacement. |
| <code>-nets {netnames}</code> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                               | Specifies the list of nets whose routing (routing and special) and constraints have to be read with the <code>-filter</code> option. Shielding wiring/vias are also read in if they are used to shield any of the specified nets. If this option is used, typically <code>regular_routing</code> is not specified as part of the <code>-filter</code> objects.                                                                                                 |

## Example

- The following command restores data using OpenAccess:

```
read_oa design amba_usb layout
```

# register\_trigger

```
register_trigger
[-help]
[{-pre | -post}
command_name
proc_name]
```

Registers the `-pre` or `-post` callback procedures with the specified commands.

The procedure registered with `-pre` parameter runs before the `command_name` parameter is used while the procedure registered with `-post` parameter runs after the `command_name` parameter is used.

**Note:** The arguments passed to `command_name` are passed to `proc_name`. If the procedure registered with the `-pre` parameter returns a `TCL_ERROR`, then `command_name` is not run.

## Parameters

|                           |                                                                                                                                                                                                                                                                            |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

# unlock\_oa\_design

```
unlock_oa_design
[-help]
oa_lib
oa_cell
oa_view
```

Unlocks the specified OpenAccess design.

A design cannot be opened if `setOaxMode -locking` is set to `true`, and the design is currently locked. You can use the `unlock_oa_design` command to free the lock so that other tools can access and edit the database. You also can use the command to override the lock, if the design is incorrectly locked.

You can use the `unlock_oa_design` command at any time.

## Parameters

|                      |                                                                                                                                                                                                                                                                            |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>oa_cell</code> | Specifies the name of the top <code>oa_cell</code> to unlock.                                                                                                                                                                                                              |
| <code>-help</code>   | Outputs a brief description that includes type and default information for each <code>unlock_oa_design</code> parameter.<br><br>For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man unlock_oa_design</code> . |
| <code>oa_lib</code>  | Specifies the name of the OpenAccess <code>oa_library</code> in which the design was saved.                                                                                                                                                                                |
| <code>oa_view</code> | Specifies the name of the <code>oa_cell</code> <code>oa_view</code> to unlock.                                                                                                                                                                                             |

## Example

- The following command unlocks the `oa_view` layout in the `oa_cell` `dtmf_chip` in the `oa_library` `designLib`:  

```
unlock_oa_design designLib dtmf_chip layout
```

# update\_oa\_lib

```
update_oa_lib
[-help]
lib_name
[-compress_level value]
[-create_cdsinfo_tag]
[-tech_attach_to_reference]
```

Updates the specified OpenAccess library from within Innovus. You can use this command to:

- Converts the specified library to use a tech reference from the attached tech so that the non-parameterized or custom vias can be written to it. If an OpenAccess design has non-parameterized vias, you should run `update_oa_lib` before invoking `write_db`. The tool is then able to save the design and does not throw an error because it can now write non-parameterized vias to the converted library.
- Add a `cdsinfo.tag` to legacy libraries created by earlier versions of Innovus.
- Modify the compression level for the library.

If you run the `update_oa_lib` command on a library that is not in attached mode, a warning is displayed. However, the script continues to run. This is useful if you want to make sure that libraries are writable for new vias and the `write_db` command does not fail.

## Parameters

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-help</code>                          | Outputs a brief description that includes type and default information for each <code>update_oa_lib</code> parameter.<br><br>For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man update_oa_lib</code> .                                                                                                                           |
| <code>-compress_level <i>value</i></code>   | Sets the compression level of the specified library. Cellviews written to the library follow the specified compression level. However, existing cellviews in the library are not modified. Use the <code>oazip</code> utility to modify the existing cellviews in the library.<br><br>Valid compression level values range from 0 to 9. A value of 0 indicates that compression is turned off. |
| <code>-create_cdsinfo_tag</code>            | Adds a <code>cdsinfo.tag</code> file to the specified library.                                                                                                                                                                                                                                                                                                                                 |
| <code><i>lib_name</i></code>                | Specifies the name of the library to be updated.                                                                                                                                                                                                                                                                                                                                               |
| <code>-<br/>tech_attach_to_reference</code> | Converts the specified library to use a tech reference from the attached tech so that new custom via definitions can be added to the library.                                                                                                                                                                                                                                                  |

## Examples

- The following command sets the compression level of the `lib1` library to 9. However, it does not change the compression of the existing cellviews in the library:

```
update_oa_lib lib1 -compress_level 9
```

The tool displays warning such as the following:

```
Changed library compressLevel from '0 (uncompressed)' to '9'. Cellviews within the
library are not affected by changing the library's compressLevel. To update the
cellviews, use the oazip utility.
```

- The following command decompresses the `my_lib` library, which previously is at compression level 1:

```
update_oa_lib my_lib -compress_level 0
```

# write\_lef\_library

```
write_lef_library
[-help]
[lef_file]
[-lef_layer_order]
[-all_auto_generated_via | -macro_only]
[-macro_only [-no_property]]
[-tech_only | -macro_only]
[-tech_only | -macro_list string]
[-use_spacing_table_default]
```

Writes the LEF library data (composed of technology data and macros) that is present in the tool's database.

The `write_lef_library` command facilitates comparisons between LEF-based input and OpenAccess-based input. LEF allows cases where `VIARULE GENERATE` has `WIDTH` specified for either the top or bottom layer. However, such cases are not supported by the OpenAccess tech. To make the comparison between LEF-based and OpenAccess-based input easier, `write_lef_library` dumps "WIDTH 0 TO 1000 ;" for any `VIARULE GENERATE` that does not have `WIDTH` specified in the original LEF.

## Parameters

|                                      |                                                                                                                                                                                                                                                                              |

| <code>-use_spacing_table_default</code> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|                                         | <p>Replaces any spacing value that matches the default spacing value with the "-" character in the LEF file.</p> <p>When reading spacing tables from a LEF file, <code>lef2oa</code> replaces any "-" table entry with the default spacing value. The spacing table in the OpenAccess version therefore contains the default values for all such entries. By default, <code>write_lef_library</code> writes out the actual values in the spacing table in the LEF file. When <code>-use_spacing_table_default</code> is specified, <code>write_lef_library</code> replaces any spacing value that matches the default value with the "-" character in the LEF file. This makes it easier for you to compare the LEF file generated by <code>write_lef_library</code> with the original LEF file.</p> <p><i>Data_type</i>: bool, optional</p> |

## Example

- The following command writes the technology data into the `tech.lef` file:

```
write_lef_library tech.lef -tech_only
```

You can set the LEF version to 5.7 or 5.8 using `write_def_lef_out_version`:

```
set_db write_def_lef_out_version 5.8
```

## write\_oa\_techfile

```
write_oa_techfile
[-help]
[out_file]
[-include_rules]
[-process_node coord]
```

Writes out a DFII style ASCII technology file that can be given to the `techLoadDump` executable to create an equivalent OpenAccess technology database.

This command is used to create and verify OpenAccess technology files that match LEF technology files. By default, `write_oa_techfile` writes out only DRC information and no LDRS or VIA information.

The expected flow for new processes is as follows:

1. Read a LEF file into the tool with `init_design`.
2. Use `write_oa_techfile` to write out the tech (`.tf`) file.
3. Run `techLoadDump` using the `.tf` file.
4. Use `lef2oa -pnrLibDataOnly` to create the LDRS and vias.

For more information, refer to the chapter "Technology File Layer Attributes" of the *Virtuoso Technology Data ASCII Files Reference*.

## Parameter

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-help</code>               | <p>Outputs a brief description that includes type and default information for each <code>write_oa_techfile</code> parameter.</p> <p>For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man write_oa_techfile</code>.</p>                                                                                                                                                                                                                                                                                      |
| <code>out_file</code>            | Specifies the output ASCII file name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>-include_rules</code>      | Includes LDRS and VIA information in the output tech file. This option should be used only if the LEF default and NDRs do not utilize fixed vias.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>-process_node coord</code> | <p>Specifies a process node value in nm. When specified, <code>write_oa_techfile</code> creates a <code>processNode</code> entry in the techfile for processes using the MASK construct. For example, if you specify <code>-process_node 20</code> to indicate a 20nm process, the following entry is included in the <code>control()</code> section of the techfile:</p> <pre>processNode(0.020)</pre> <p>If <code>-process_node</code> is not specified and the <code>write_oa_techfile</code> command detects MASK constructs on any layer, it returns an error.</p> |

## Examples

- The following set of commands updates an OpenAccess technology file with any missing information from a LEF technology file:

```
#Initialize a design using LEF files
write_lef_library -tech_only lef.lef #A LEF file in canonical
 #sorted order for easy
 #comparison with diff

write_oa_techfile lef.tf #A DFII ASCII tech file
 #that can be given to
 #techLoadDump executable

#Edit existing OA tech file to add any missing information in
#the lef.tf file

#Initialize a design using the new OA tech. Then:
write_lef_library -tech_only oa.lef #A LEF file in canonical
 #order derived from OA tech

#Compare the two LEF files. Any differences need to be fixed
#or explained.
diff lef.lef oa.lef
```

## Example

- The following command initializes the environment to start writing data for JedAI for the `cts` flow phase with the `default` scenario for the `dtmf` design.

```
init_ml -prefix out/ -name dtmf -flow_phase cts -scenario default -comment "This is a demo."
```

## Related Information

- [write\\_ml\\_timing\\_graph](#)
- [write\\_ml\\_timing\\_path](#)

## write\_ml\_design

```
write_ml_design
[-help]
[-no_power]
[-objects object_list]
-prefix string
[-verbose]
[-views view_list]
```

Writes design-related data for JedAI to csv files with specified prefix. It includes data that is design specific and relates to logical, physical, and timing type objects.

Before running `write_ml_design`, the following two commands should be run:

- `report_timing`
- `write_global_slack_report -include_ports`

## Parameters

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Example

- The following command writes the attributes of all design objects to csv files with the specified prefix:

```
write_ml_design -prefix out/
```

## Related Information

- `init_ml`
- `report_timing`
- `write_global_slack_report`
- `write_ml_library`
- `write_ml_timing_graph`
- `write_ml_timing_path`

# write\_ml\_library

```
write_ml_library
[-help]
[-objects object_list]
-prefix string
```

Writes library-related data for JedAI to csv files with the specified prefix. It includes data that is library specific and relates to lib\_cells, timing\_tables, and power\_tables.

## Parameters

|                              |                                                                                                                                                                                                                                                                                                          |

## Example

- The following command writes the timing-related data for JedAI to csv files with the specified prefix:

```
write_ml_timing_graph -prefix out/
```

## Related Information

- `init_ml`
- `write_ml_design`
- `write_ml_library`
- `write_ml_timing_path`

# write\_ml\_timing\_path

```
write_ml_timing_path
[-help]
[-anchor_file string]
[-begin_end_pair]
[-chain_levels int]
[-chain_path]
[-each_endpoint]
[-from pin_list]
[-gen_anchor]
[-hpin]
[-io_only]
[-max_paths int]
[-max_slack float]
[-nworst int]
[-partitions partition_list]
[-path_group string]
[-per_partition]
-prefix string
[-retime {aocv ssta path_slew_propagation aocv_path_slew_propagation}]
[-retime_mode {path exhaustive}]
[-start_pathid int]
[-to pin_list]
[-verbose]
[-views view_list]
```

Writes timing-related data for JedAI to csv files. It includes data for individual timing paths. Timing path data can be computed in either [graph-based analysis \(GBA\)](#) or [path-based analysis \(PBA\)](#) fashion using the `-retime` option.

## Parameters

|                            |                                                                                                                                                                                                                                                                                                   |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -help                      | <p>Prints a brief description that includes the type and default information for each <code>write_ml_timing_path</code> parameter.</p> <p>For a detailed description of the command and all of its parameters, use the <code>man</code> command</p> <p><code>man write_ml_timing_path</code>.</p> |
| -anchor_file <i>string</i> | <p>Specifies the name of the anchor file to be used as input.</p> <p><i>Data_type</i>: string, optional</p>                                                                                                                                                                                       |

|                                         |                                                                                                                   |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <code>-begin_end_pair</code>            | Reports all violations between unique source and target register pairs.<br><i>Data_type</i> : bool, optional      |
| <code>-chain_levels int</code>          | Specifies the chain level if <code>-chain_path</code> is enabled.<br><i>Data_type</i> : int, optional             |
| <code>-chain_path</code>                | Gets chained paths.<br><i>Data_type</i> : bool, optional                                                          |
| <code>-each_endpoint</code>             | Specifies whether to dump at least one path for each end point.<br><i>Data_type</i> : bool, optional              |
| <code>-from pin_list</code>             | Dumps data from the specified pin(s).<br><i>Data_type</i> : tcl_obj, optional                                     |
| <code>-gen_anchor</code>                | Generates the anchor file.<br><i>Data_type</i> : bool, optional                                                   |
| <code>-hpin</code>                      | Dumps hpin in timing points.<br><i>Data_type</i> : bool, optional                                                 |
| <code>-io_only</code>                   | Specifies that only the io path should be dumped.<br><i>Data_type</i> : bool, optional                            |
| <code>-max_paths int</code>             | Specifies the max_paths for <code>report_timing</code> .<br><i>Data_type</i> : int, optional                      |
| <code>-max_slack float</code>           | Specifies the max_slack for <code>report_timing</code> .<br><i>Data_type</i> : float, optional                    |
| <code>-nworst int</code>                | Specifies the nworst for <code>report_timing</code> .<br><i>Default</i> : 100<br><i>Data_type</i> : int, optional |
| <code>-partitions partition_list</code> |                                                                                                                   |
|                                         | Specifies a partition list if <code>-per_partition</code> is set.<br><i>Data_type</i> : tcl_obj, optional         |
| <code>-path_group string</code>         | Specifies the path_group for <code>report_timing</code> .<br><i>Data_type</i> : string, optional                  |

|                                                                                   |                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-per_partition</code>                                                       | Specifies that only paths through top level partitions should be dumped.<br><i>Data_type</i> : bool, optional                                                                                                                                     |
| <code>-prefix string</code>                                                       | Specifies the prefix for the output files.<br><i>Data_type</i> : string, required                                                                                                                                                                 |
| <code>-retime {aocv ssta path_slew_propagation aocv_path_slew_propagation}</code> |                                                                                                                                                                                                                                                   |
|                                                                                   | Specifies the method to be used for reanalysis of specified set of paths with <code>report_timing</code> .<br><i>Data_type</i> : enum, optional                                                                                                   |
| <code>-retime_mode {path exhaustive}</code>                                       |                                                                                                                                                                                                                                                   |
|                                                                                   | Passes the specified retime mode to <code>report_timing</code> . To understand the difference between the two retime modes, <code>path</code> and <code>exhaustive</code> , see <code>report_timing</code> .<br><i>Data_type</i> : enum, optional |
| <code>-start_pathid int</code>                                                    | Specifies the starting path id.<br><i>Default</i> : 1<br><i>Data_type</i> : int, optional                                                                                                                                                         |
| <code>-to pin_list</code>                                                         | Dumps data to the specified pin(s).<br><i>Data_type</i> : tcl_obj, optional                                                                                                                                                                       |
| <code>-verbose</code>                                                             | Displays a more detailed message.<br><i>Data_type</i> : bool, optional                                                                                                                                                                            |
| <code>-views view_list</code>                                                     | Dumps the timing path for the specified analysis view(s).<br><i>Data_type</i> : tcl_obj, optional                                                                                                                                                 |

## Example

- The following command writes out the attributes of timing paths to csv files with the specified prefix:

```
write_ml_timing_path -prefix out/ -max_paths 10000 -nworst 1
```

## Related Information

- `init_ml`
- `report_timing`
- `write_ml_design`
- `write_ml_library`
- `write_ml_timing_graph`

- [write\\_physical\\_context\\_data](#)
- [read\\_physical\\_context\\_data](#)
- [reset\\_physical\\_context\\_data](#)

## **add\_fillers Category Attributes**

The root attributes in the `add_fillers` category are:

- [add\\_fillers\\_cells](#)
- [add\\_fillers\\_check\\_trim\\_rule](#)
- [add\\_fillers\\_double\\_height\\_filler\\_insertion](#)
- [add\\_fillers\\_enable\\_restore\\_filler\\_flow](#)
- [add\\_fillers\\_prefix](#)

- [vt\\_swap\\_out\\_dir](#)
- [vt\\_swap\\_out\\_file](#)
- [vt\\_swap\\_to\\_fix\\_filler\\_violations](#)

To set the value of any root attribute, use the [set\\_db](#) command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the [get\\_db](#) command:

```
get_db attribute_name
```

To get the current value of all attributes in the [add\\_fillers](#) category, use the following command:

```
get_db -category add_fillers
```

## **add\_fillers\_cells**

```
add_fillers_cells {{list-of-cells1}} {list-of-cells2} ...}
```

*Default:* ""

*Data\_type:* string

Specifies the filler cells to add with [add\\_fillers](#). Enclose the filler cell names in quotation marks (") or curly braces ({ }). You can specify multiple cell lists at one time, using curly braces ({ }) to separate each one.

## **add\_fillers\_check\_trim\_rule**

```
add_fillers_check_trim_rule {true | false}
```

*Default:* false

*Data\_type:* bool, read/write

Controls trim rule checking during the filler insertion. When set to true, the trim rule is checked, and runtime increases.

## **add\_fillers\_double\_height\_filler\_insertion**

```
add_fillers_double_height_filler_insertion {true | false}
```

*Default:* false

*Data\_type:* bool, read/write

Enables double height filler during filler insertion.

## add\_fillers\_enable\_restore\_filler\_flow

`add_fillers_enable_restore_filler_flow {true | false}`

*Default:* true

*Data\_type:* bool, read/write

When this option is set to `false`, fillers are not saved in the memory (which is default i.e the save and restore filler insertion flow is default ON).

## add\_fillers\_prefix

`add_fillers_prefix prefix`

*Default:* ""

*Data\_type:* string

Specifies the prefix for the added filler cells.

## vt\_swap\_out\_dir

`vt_swap_out_dir vtSwapReportFileDirectory`

*Default:* Current directory ./

*Data\_type:* string, read/write

Specifies the directory of the vt swap report file,

## vt\_swap\_out\_file

`vt_swap_out_file fileName`

*Default:* ""

*Data\_type:* string, read/write

Specifies the file name of the vt swap report.

## vt\_swap\_to\_fix\_filler\_violations

`vt_swap_to_fix_filler_violations { true | false }`

*Default:* false

*Data\_type:* string, read/write

Changes the VT of the functional cell to fix filler gaps.

# gui\_clear\_scan\_chains

gui\_clear\_scan\_chains  
[-help]  
[*scanPartitionName*]

Removes scan chains from the display.

## Parameters

|                          |                                                               |
|--------------------------|---------------------------------------------------------------|
| <i>scanPartitionName</i> | Specifies the scan partition name to remove from the display. |
|--------------------------|---------------------------------------------------------------|

## Related Topic

- [gui\\_show\\_scan\\_chains](#)

# gui\_clear\_spare\_cells

`gui_clear_spare_cells`

Removes spare cell instances from the display.

## Parameters

None

## Related Topic

- [gui\\_show\\_spare\\_cells](#)

## gui\_show\_scan\_chains

```
gui_show_scan_chains
[-help]
[scan_chain_name]
```

Displays a scan chain. You must load the scan information, place the design, and view the design in the Placement view. Use this command after scan chains are traced.

### Parameters

|                              |                                                                                                                           |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <code>scan_chain_name</code> | Specifies the scan chain.<br><i>Default:</i> If you do not specify this parameter, the software displays all scan chains. |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------|

### Examples

- The following command displays all scan chains in the design:  
`gui_show_scan_chains`
- The following command displays the scan chain whose name is `chain0`.  
`gui_show_scan_chains chain0`

# gui\_show\_spare\_cells

gui\_show\_spare\_cells

Displays the results of placing the spare instances. You must specify the spare cell types or spare instances before placing the design.

## Parameters

None

## Examples

The following set of commands displays all spare instances defined by the [set\\_spare\\_insts](#) command:

```
specifySpareGate -cell ADDFXLT1T10
placeDesign
gui_show_spare_cells
```

- `place_global_ignore_low_effort_path_groups`

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `place` category, use the following command:

```
get_db -category place
```

## place\_3d\_use\_existing\_bump\_tsv

```
place_3d_use_existing_bump_tsv {true|false}
```

*Default:* false

*Data\_type:* string, read-only

Enables 3D placement to use preplaced but unassigned bump/TSV in the design for signal net assignment. The preplaced bump/TSV must be the specified cells for 3D concurrent bump/TSV insertion and legalization.

**Note:** When you set this option to `true`, you need to ensure that enough bump/TSV is preplaced and the corresponding bump grid is created in each die before invoking the 3D placement.

## place\_cell\_edge\_spacing

```
place_cell_edge_spacing {cell_edge_type1 cell_edge_type2 spacing}
```

*Default:* ""

*Data\_type:* string

Specifies the list of cell edge-type spacing values from LEF CELLEDGESPACINGTABLE or OA techfile that affects the placer. It specifies the min-spacing between different edge-types of std-cells, in a list format: {cell\_edge\_type1 cell\_edge\_type2 spacing}. The edge-type names match the base\_cell's right\_edge\_type and left\_edge\_type attribute values.

## place\_check\_report\_fixed\_inst\_on\_blockage

```
place_check_report_fixed_inst_on_blockage {true | false}
```

*Default:* false

*Data\_type:* bool, read/write

When `true`, `check_place` reports placement blockage violations for fixed instances under placement blockages.

## place\_design\_enable\_3d

```
place_design_enable_3d {true | false}
```

*Default:* false

*Data\_type:* bool, read/write

Enables 3D placement in Integrity 3D-IC platform. You need to set this to true before invoking concurrent macro placement (`place_design -concurrent_macros`), standard cell placement (`place_opt_design -place`), and bump/TSV insertion (`place_bump_tsv_detail`) in a 3D design.

## place\_design\_integrity\_ir\_fix\_effort

```
place_design_integrity_ir_fix_effort {low|medium|high}
```

*Default:* medium

*Data\_type:* enum, read/write

Sets the power integrity placement IR fixing effort.

## place\_design\_refine\_macro

```
place_design_refine_macro {true | false}
```

*Default:* false

*Data\_type:* bool, read/write

Specifies whether to run `place_macro_detail` after `place_design -concurrent_macros`. When `place_design -concurrent_macros` is run, it sets the value of `place_opt_run_global_place` attribute to seed.

## place\_detail\_allow\_border\_pin\_abut

```
place_detail_allow_border_pin_abut {true | false}
```

*Default:* false

*Data\_type:* bool

Some libraries have cells with pin geometry that is not set back by half-routing pitch from the normal PR-boundary of that cell. In cases where the pin geometries touch the cell PR-boundary, placement of an instance of this cell can cause a DRV violation with a normal pin geometry of the other cells. To avoid these DRVs, placer will add one Site padding to the cell-side during pre-processing, thus satisfying the min-spacing rules. The `place_detail_allow_border_pin_abut` attribute disables this pre-emptive DRV avoidance behavior, and no auto-padding is done when the option is set to `true`.

## place\_detail\_allow\_single\_height\_row\_symmetry\_x

```
place_detail_allow_single_height_row_symmetry_x siteName
```

*Default:* ""

*Data\_type:* bool, read/write

Specifies a single height row tech-site, which allows symmetry X during detail place.

## place\_detail\_check\_route

```
place_detail_check_route {true | false}
```

*Default:* false

*Data\_type:* bool

Considers pre-routed FIXED signal wires and avoids creating DRC violations between FIXED signal wires and instance pins. When this attribute is not specified, `place_detail` ignores FIXED signal wires.

**Note:** Using this attribute might result in longer run time.

If you specify `place_detail -io_pin_blockage`, you do not need to specify `-check_route` for signal pins because `place_detail` will treat the signal pins similar to supply pins for blockages. However, signal wires still need this attribute.

## place\_detail\_color\_aware\_legal

```
place_detail_color_aware_legal {true | false}
```

*Default:* false

*Data\_type:* bool

Enables placer to honor and fix double pattern constraints between adjacent cells.

**Note:** This attribute does not affect cell to pre-route color DRC checks.

## place\_detail\_context\_aware\_legal

```
place_detail_context_aware_legal {none|all|optional|required|user|ignore_soft}
```

*Default:* all

*Data\_type:* enum\* {none all optional required user ignore\_soft}

Instructs placer to support cell edge to cell edge spacing constraints as defined in the LEF files.

The `optional`, `required`, `user` argument values can be used separately or together, but they are exclusive to `all` and `none`.

## place\_detail\_honor\_inst\_pad

```
place_detail_honor_inst_pad {true | false}
```

*Default:* false

*Data\_type:* bool

Honors padding from `set_inst_padding` in detail placement.

## place\_detail\_ir\_aware\_max\_drive\_strength

```
place_detail_ir_aware_max_drive_strength maxDriveStrength
```

*Default:* 0.0

*Data\_type:* double, read/write

Specifies the current density value for the IR critical instances above which the instances gets padded during `place_detail`. This means that the IR critical instances with the current density value more than the specified value gets padded.

**Note:** There may be larger cell movement with this option, which can degrade the timing. So, it is preferred to be used at the pre-CTS stage in the flow. The current density values for the IR-critical instances are dumped in the Voltus Reports.

## place\_detail\_pad\_fixed\_insts

```
place_detail_pad_fixed_insts {true | false}
```

*Default:* false

*Data\_type:* bool

Specifies whether the `place_detail` command honors cell padding on `FIXED` instances.

## place\_detail\_swap\_eeq\_cells

```
place_detail_swap_eeq_cells {true | false}
```

*Default:* false

*Data\_type:* bool

Determines whether master cells can be replaced by EEQ cells during detailed placement to improve routability. After detailed placement, the software reports the number of replacements. EEQ cells are defined in the LEF file.

## place\_detail\_m3\_stripe\_push\_down

`place_detail_m3_stripe_shrink site_units`

*Default:* -1

*Data\_type:* int

Specifies the width threshold in site units for virtual push down of M3 stripe to M2 for M1 pin-access.

If the default value is set to -1, it indicates that no M3 stripe will be pushed down. If the default value is set to 0, it indicates that all M3 stripes will be pushed down. If the default value is larger than 0, then all M3 stripes having width greater than the specified value will be pushed down.

## place\_detail\_m3\_stripe\_shrink

`place_detail_m3_stripe_shrink site_units`

*Default:* 0

*Data\_type:* int

Specifies the shrink effort of the virtual M2 stripe by given total site units. This global should work with `place_detail_m3_stripe_push_down`.

If the default value is set to 0, it indicates that the entire pushed down M3 stripe is used to evaluate M1 pin access. If the default value is set to more than 0, it indicates that M3 stripe will shrink by the specified value before it is pushed down to M2. The left side will shrink first. For example, if the specified value is set to 1, the M3 stripe will shrink by 1 site on left, and if the specified value is set to 2, 1 site on left will shrink, along with 1 site on right.

## place\_detail\_use\_diffusion\_transition\_fill

`place_detail_use_diffusion_transition_fill {true | false}`

*Default:* false

*Data\_type:* bool

Specifies that the design has fillers with jogged diffusion obs. Use this attribute for designs where fillers with jogged diffusion obs are to be inserted between cells with varying diffusion widths.

## place\_detail\_use\_gate\_array\_filler\_groups

`place_detail_use_gate_array_filler_groups {true | false}`

*Default:* false

*Data\_type:* bool

Specifies that the filler cell instances will only be replaced by logic instances that belong to same GA groups.

## **place\_detail\_pgftv\_insertion\_cell\_list**

`place_detail_pgftv_insertion_cell_list` *listOfCells*

*Default:* ""

*Data\_type:* string, read/write

Specifies the list of cells as PG FTV cells.

## **place\_global\_adaptive\_subd1**

`place_global_adaptive_subd1` {true|false}

*Default:* false

*Data\_type:* bool, read/write

When set to true, placement will call Opt API to get a list of cells not usable for subD1 and disable the usage of cells in the placement engine.

`place_global_adaptive_subd1` can be used independently to get the list of subD1 cells.

## **place\_global\_ignore\_low\_effort\_path\_groups**

`place_global_ignore_low_effort_path_groups` {true | false}

*Default:* false

*Data\_type:* bool, read/write

When `place_global_enable_distributed_place` is set to true, for low effort path groups, the tool ignores it and does not work on the timing.

# report\_congestion

```
report_congestion
[-help]
[-3d]
[-hotspot]
[-include_blockage]
[-num_hotspot number]
[-overflow]
```

Reports the early global route congestion and the local hotspot score.

Route needs be called before using this command.

## Parameters

|                                |                                                                                                                                                                                                                                                                              |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -help                          | Outputs a brief description that includes type and default information for each <code>report_congestion</code> parameter.<br><br>For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man report_congestion</code> . |
| -3d                            | Honors 3d congestion map. When specified, it enables the layer-based congestion reporting.                                                                                                                                                                                   |
| -hotspot                       | Reports the local hotspot score.                                                                                                                                                                                                                                             |
| -include_blockage              | Includes blockage area in hotspot.                                                                                                                                                                                                                                           |
| -<br>num_hotspot <i>number</i> | Specifies the number of hotspots to be reported.                                                                                                                                                                                                                             |
| -overflow                      | Reports horizontal and vertical overflow.                                                                                                                                                                                                                                    |

- The following command reports the local hotspot score:

```
report_congestion -hotspot
```

### Output:

```
Local HotSpot Analysis: normalized max congestion hotspot area = 0.00, normalized total
congestion hotspot area = 0.00 (area is in unit of 4 std-cell row bins)
```

## set\_cell\_edge\_spacing

```
set_cell_edge_spacing
[-help]
{<type1> <type2>
-spacing spacing
[-except_exact_spacing distance]
[-except_abutted | -forbidden_spacing] [-except_non_filler_in_between] } | [-reset]
```

Creates the cell edge spacing rule as in `CELLEDGESPACINGTABLE` in LEF.

 The tool by default supports the latest Tcl settings. If a user tries to change the edge spacing, the tool will generate a warning message that resetting edge spacing would overwrite the old value.

**Note:** This command is not supported for save and restore design.

## Parameters

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-except_abutted</code>                | Specifies that two abutted macros of the given edge types are also allowed.                                                                                                                                                                                                                                                                                                                             |
| <code>-except_non_filler_in_between</code>  | Specifies that the edge spacing is only for adjacent instances.<br>If two MACROs (cells) have a edge-spacing rule, say 0.8 micron, then normally the rule applies regardless of presence of another macro (cell) in the gap between. When the <code>-except_non_filler_in_between</code> option is used, the rule is exempted when a non-filler cell is present between the two constrained cell edges. |
| <code>-except_exact_spacing distance</code> | Specifies an exception distance to the minimum spacing.<br><i>Data_type</i> : double, optional                                                                                                                                                                                                                                                                                                          |
| <code>&lt;type1&gt;</code>                  | Specifies edge <code>type1</code> for edge spacing.                                                                                                                                                                                                                                                                                                                                                     |
| <code>&lt;type2&gt;</code>                  | Specifies edge <code>type2</code> for edge spacing.                                                                                                                                                                                                                                                                                                                                                     |
| <code>-forbidden_spacing</code>             | Forbids <code>edgeType1</code> and <code>edgeType2</code> without the space.                                                                                                                                                                                                                                                                                                                            |
| <code>-help</code>                          | Outputs a brief description that includes type and default information for each <code>set_cell_edge_spacing</code> parameter.<br><br>For a detailed description of the command and all of its parameters, use the man command:<br><code>man set_cell_edge_spacing</code>                                                                                                                                |
| <code>-reset</code>                         | Resets the cell edge spacing to LEF.                                                                                                                                                                                                                                                                                                                                                                    |
| <code>-spacing spacing</code>               | Specifies edge spacing between <code>edgeType1</code> and <code>edgeType2</code> .<br><br>If there is no spacing defined between two edge types, it indicates that there is no spacing constraint (or 0.0 $\mu\text{m}$ ) between them.                                                                                                                                                                 |

## Example

The following command creates 0.18  $\mu\text{m}$  spacing between `grp1` and `grp2`:

```
set_cell_edge_spacing grp1 grp2 0.18
```

## set\_cell\_edge\_type

```
set_cell_edge_type
[-help]
-cell cellName
{-left edgeType | -right edgeType | -bottom edgeType | -reset}
[{-left edgeType | -right edgeType} [-cell_row rowNumber]]
[{-left edgeType | -right edgeType} [-half {top | bottom}]]
[{-top edgeType | -bottom edgeType} [-range {x y}]] [{-cell cellName} [-reset]]
```

Specifies edge type for cell edges as `EDGETYPE` in macro LEF. It allows to specify one edge at a time for a particular cell.

To ensure the correct edge type specification, edge types asserted by `set_cell_edge_type` command should be pre-defined by the `set_cell_edge_spacing` command.

For example:

```
set_cell_edge_spacing grp1 grp2 0.18
set_cell_edge_type -cell BUF1X -left grp1
```

If the edge type is specified without corresponding spacing rule, tool gives a warning and ignores the edge type specification.

**Note:** This command is not supported for save and restore design.

### Parameters

|                         |                                                 |
|-------------------------|-------------------------------------------------|
| -bottom <i>edgeType</i> | Specifies an edge type on the bottom side.      |
| -cell <i>cellName</i>   | Specifies cell to which to add edge constraint. |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Example

The following commands specify one edge at a time for the `BUF1X` cell

- `set_cell_edge_type -cell BUF1X -left grp1`
- `set_cell_edge_type -cell BUF1X -right grp1 -cell_row 1`
- `set_cell_edge_type -cell BUF1X -right grp1 -cell_row 2`

# report\_cell\_edge\_type

```
report_cell_edge_type
[-help]
[-out_file cellName]
[-file fileName]
```

Reports the edge type of the specified cell.

## Parameters

|                              |                                                                                                                                                                                                                                                                         |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -<br><i>cell cellName</i>    | Specifies the cell name for which edge type is to be reported.<br><br>If the cell name is not specified, all the cell edge types are reported in the edge_type.rpt file report file.                                                                                    |
| -out_file<br><i>fileName</i> | Specifies the file name to dump cell edge type(s) .<br><br>If no file name is specified, the edge_type.rpt file is used to generate the report.                                                                                                                         |
| -help                        | Outputs a brief description that includes type and default information for each report_cell_edge_type parameter.<br><br>For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man report_cell_edge_type</code> . |

# report\_density\_map

```
report_density_map
[-help]
[-grid_length rowHeight]
[-grid_unit microns]
[-ignore_block {true|false}]
[-ignore_filler {true|false}]
[-threshold density]
```

Generates a map that uses colors to represent placement density and generates a placement density report. If you run this command without parameters, it generates a map with a threshold of 0.75 and measures the grid in row height.

Use this command any time after placement.

Use the Display Density Map form to select colors and step-size for the density levels in the map.

## Parameters

|                                              |                                                                                                                                                                                                                                                                                |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-grid_unit <i>microns</i></code>       | Specifies the value (in micron) of side of square grid for density calculations.                                                                                                                                                                                               |
| <code>-grid_length <i>rowHeight</i></code>   | Specifies the value (in row-height) of side of square grid for pin density calculations.                                                                                                                                                                                       |
| <code>-help</code>                           | Outputs a brief description that includes type and default information for each <code>report_density_map</code> parameter.<br><br>For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man report_density_map</code> . |
| <code>-ignore_block {true false}</code>      | Skips block cells instances from both supply and demand calculation.                                                                                                                                                                                                           |
| <code>-ignore_filler { true   false }</code> | Ignores the density of fillers in the post-filler density heat map to show density of standard cells.<br><br><i>Default:</i> <code>false</code>                                                                                                                                |
| <code>-threshold <i>density</i></code>       | Specifies a threshold density value for the grid. Any grid under the threshold value is not reported. The value must be positive.                                                                                                                                              |

## Example

The following are output from command `report_density_map`. It generates a map with default threshold of 0.75 and measured in row height:

```
powerDomain TOP: bins with density > 0.75 = 0.519 % (6 / 1156)
bin size: 59 sites by 10 row(s). total 1156 bins (34 by 34)
density range #bins %
0.75 - 0.8 5 0.4325
0.8 - 0.85 1 0.08651
total 6 0.519
```

# report\_pin\_density\_map

```
report_pin_density_map
[-help]
[-step step_value]
[-grid_unit micron]
[-grid_length numberRow]
[-threshold density]
```

Generates a map that uses colors to represent pin density and generates a pin density report. Use this command any time after placement.

## Parameters

|                                   |                                                                                                                                                                                                                                                                                |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -help                             | Outputs a brief description that includes type and default information for each <code>report_pin_density_map</code> parameter.<br><br>For a detailed description of the command and all of its parameters, use the man command:<br><br><code>man report_pin_density_map</code> |
| -step <i>step_value</i>           | Specifies the range step for displaying the pin density map.<br><br><i>Default:</i> 0.05                                                                                                                                                                                       |
| -grid_unit <i>micron</i>          | Specifies the value of side of square grid for pin density calculations.<br><br><i>Default:</i> 50<br><i>Minimum:</i> 0.000000<br><i>Maximum:</i> 1000.000000                                                                                                                  |
| -<br>grid_length <i>numberRow</i> | Specifies the value (in row-height) of side of square grid for pin density calculations.<br><br><i>Default:</i> 10<br><i>Minimum:</i> 1<br><i>Maximum:</i> 100                                                                                                                 |
| -threshold <i>density</i>         | Specifies a threshold density value over which the densities must be reported. Any grid under the threshold value is not reported. The value must be positive.<br><br><i>Default:</i> 0.5<br><i>Minimum:</i> 0.000000<br><i>Maximum:</i> 2.000000                              |

## Examples

The following command reports the pin density map:

```
report_pin_density_map
*** Starting report pin density ***
default core: bins with pin density > 0.5 = 0 % (0 / 1)
bin size: 90 sites by 10 row(s). total 1 bins (1 by 1)
pin density range #bins %
total 0 0
```

# write\_physical\_context\_data

```
write_physical_context_data
[-help]
<file>
[-designation name]
[-type technologyName]
```

Writes the physical context data needed for timing analysis. The data that is being written is associated with each instance in the design, or module.

The command can be used, both in Innovus and Tempus, if Tempus is in physical-mode and has the physical data in DB to use for writing out the LDE data.

## Parameters

|                             |                                                                                                                                                                                                                                                                                     |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -help                       | Outputs a brief description that includes type and default information for each <code>write_physical_context_data</code> parameter.<br><br>For a detailed description of the command and all of its parameters, use the man command: <code>man write_physical_context_data</code> . |
| -designation <i>name</i>    | Specifies the Rx layer width map from micron to enum -um:nsw{:um:nsw}.                                                                                                                                                                                                              |
| <file>                      | Specifies the name of the output file.                                                                                                                                                                                                                                              |
| -type <i>technologyName</i> | Specifies the technology name.                                                                                                                                                                                                                                                      |

## Related Information

- `read_physical_context_data`

# read\_physical\_context\_data

```
read_physical_context_data
[-help]
<file>
[-clear]
[-type technologyName]
```

Reads the physical context data needed for timing analysis. The data that is being read is associated with each instance in the design, or module.

The command can be used in both Innovus and Tempus to restore the state of LDE as long as there is no netlist change. To read the data, there need not be physical information in the DB, as the data can be annotated directly to instances - to be used by STA.

## Parameters

|                                |                                                                                                                                                                                                                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -help                          | Outputs a brief description that includes type and default information for each <code>read_physical_context_data</code> parameter.<br><br>For a detailed description of the command and all of its parameters, use the man command: <code>man read_physical_context_data</code> . |
| -clear                         | Clears physical context data before reading.                                                                                                                                                                                                                                      |
| <file>                         | Specifies the names of the input files.                                                                                                                                                                                                                                           |
| -type<br><i>technologyName</i> | Specifies the technology name.                                                                                                                                                                                                                                                    |

## Related Information

- `write_physical_context_data`

# reset\_physical\_context\_data

```
reset_physical_context_data
[-help]
```

Clears the physical context data in the DB.

## Parameters

None

# encrypt\_thermal\_file

```
encrypt_thermal_file
-input ASCII.txt
-output $encrypted_conductivity.txt
```

Specifies to encrypt the file containing the thermal conductivity value for layers, and to protect foundry's thermal conductivity parameters used for power map generation. This encrypted file is then specified with the `report_power -thermal_conductivity_inputs` parameter for generating a tile-based power map file.

## Parameters

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-input ASCII.txt</code>                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                                                   | <p>Specifies the name of the ASCII thermal file that needs to be encrypted. This file contains the thermal conductivity parameters used for power map generation.</p> <p>The <code>-input</code> parameter supports both layer type and layer name based thermal conductivity file.</p> <p>The following is a snippet of the input thermal conductivity file content (layer type based file):</p> <pre>Metal 430 Silicon 250 Dielectric 0.6</pre> |
| <code>-output \$encrypted_conductivity.txt</code> |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Specifies the name of the encrypted output thermal file.

The following is a snippet of the encrypted thermal conductivity file content:

```
Metal $encryption_value
Silicon $encryption_value
Dielectric $encryption_value
```

## Examples

- The following command encrypts the specified input file (`format_1.txt`) to generate the encrypted output file (`format_1_encr.txt`):

```
encrypt_thermal_file -input encrypt/format_1.txt -output encrypt/format_1_encr.txt
```

The encrypted file (`format_1_encr.txt`) is then specified for generating a tile-based power map file, as shown below:

```
report_power \
-out_file static.rpt \
-thermal_power_map_tiles {5 5}\
-thermal_power_map_format stack \
-thermal_power_map_file powermap_format1_encr_in.txt \
-thermal_conductivity_inputs ./encrypt/format_1_encr.txt
```

# get\_default\_switching\_activity

```
get_default_switching_activity
[-help]
[-clip_activity_to_domain_freq]
[-clock_gates_enable]
[-clock_gates_output]
[-clock_gates_output_ratio]
[-combinational_clock_gate_ratio]
[-duty]
[-global_activity]
[-input_activity]
[-integrated_clock_gate_ratio]
[-macro_activity]
[-period]
[-sequential_activity]
```

Displays the following information about a `set_default_switching_activity` parameter in the system log file and in the system console:

- Parameter name
- Current value

If you do not specify a parameter, the software displays information for all of the `set_default_switching_activity` parameters. The `get_default_switching_activity` command prints only the user-specified value for the parameters. If a parameter has not been set using the `set_default_switching_activity` command, the `get_default_switching_activity` command does not output any information in the console.

## Parameters

|                              |                                                                                                                                                                                                                                                                                    |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-help</code>           | Outputs a brief description that includes type and default information for each <code>get_default_switching_activity</code> parameter. For a detailed description of the command and all of its parameters, use the man command: <code>man set_default_switching_activity</code> . |
| <code>parameter_names</code> | Displays information for the specified parameters. You can specify one or more parameters.<br><br>See <code>set_default_switching_activity</code> for description of the parameters you can specify.                                                                               |

## Examples

The following command displays the current setting of the `-period` parameter:

```
get_default_switching_activity -period
```

The software displays the following information:

```
-period {20}
```

# get\_dynamic\_power\_simulation

```
get_dynamic_power_simulation
[-help]
[-activity_pattern]
[-period]
[-resolution]
```

Displays the following information about a `set_dynamic_power_simulation` parameter in the system log file and in the system console:

- Parameter name
- Current value

If you do not specify a parameter, the software displays information for all of the `set_dynamic_power_simulation` parameters. The `get_dynamic_power_simulation` command prints only the user-specified value for the parameters. If a parameter has not been set using the `set_dynamic_power_simulation` command, the `get_dynamic_power_simulation` command does not output any information in the console.

## Parameters

|                              |                                                                                                                                                                                                                                                                                             |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-help</code>           | Outputs a brief description that includes type and default information for each <code>get_dynamic_power_simulation</code> parameter. For a detailed description of the command and all of its parameters, use the <code>man</code> command: <code>man set_dynamic_power_simulation</code> . |
| <code>parameter_names</code> | Displays information for the specified parameters. You can specify one or more parameters.<br><br>See <code>set_dynamic_power_simulation</code> for description of the parameters you can specify.                                                                                          |

## Examples

The following command displays the current setting of the `-period` parameter:  
`get_dynamic_power_simulation -period`

The software displays the following information:  
`-period {20}`

# merge\_vtm

```
merge_vtm
[-help]
-config filename
[-rundir directory]
[-merged_file filename]
[-format {simple | metal | stack}]
```

Specifies to import the top-level and other block-level Voltus thermal models (VTMs) having the specified design configuration to generate a merged uniform single VTM for Celsius usage.

## Parameters

|                  |                                                                                 |
|------------------|---------------------------------------------------------------------------------|
| -help            | Outputs the command usage and a brief description about the command parameters. |
| -config filename |                                                                                 |

|  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|  | <p>Specifies the output folder for the merged thermal model.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Examples

- The following command specifies to generate a merged VTM:  

```
merge_vtm -config /Run_Merge_VTM/design_both.cfg -rundir merged_vtm_out_both -
merged_file merge_vtm.txt
```
- The following command specifies to generate a merged VTM containing only power tables:  

```
merge_vtm -config /Run_Merge_VTM/design_both.cfg -rundir merged_vtm_out_simple -
merged_file merge_vtm.txt -format simple
```
- The following command specifies to generate a merged VTM containing only metal density tables:  

```
merge_vtm -config /Run_Merge_VTM/design_both.cfg -rundir merged_vtm_out_metal -
merged_file merge_vtm.txt -format metal
```
- The following command specifies to generate a merged VTM containing both power and metal density tables:  

```
merge_vtm -config /Run_Merge_VTM/design_both.cfg -rundir merged_vtm_both_both -
merged_file merge_vtm.txt -format stack
```

## power Category Attributes

The root attributes in the `power` category are:

- `power_add_simulation`
- `power_adjust_input_activity_in_iterations`
- `power_adjust_macro_activity_in_iterations`
- `power_keep_clock_gate_ratio_in_iterations`
- `power_analysis_temperature`
- `power_annotation_detail_report`
- `power_auto_twf_delay_annotation`

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `power` category, use the following command:

```
get_db -category power
```

## power\_add\_simulation

```
power_add_simulation {true | false}
```

*Default:* `false`

*Data\_type:* Boolean

Specifies to add simulation if there are no simulation vectors or if all primary sources are not annotated by vectors. This parameter can be used to ensure complete design coverage. Event simulation is done for primary sources like primary input, flops, and macros.

This attribute is only applicable to the event-based power analysis flow.

## Related Commands

- `set_power`

## power\_adjust\_input\_activity\_in\_iterations

```
power_adjust_input_activity_in_iterations {true | false}
```

*Default:* true

*Data\_type:* Boolean

Specifies whether to keep the input activity fixed or automatically adjust the activity value for each iteration of state propagation. This attribute is only applicable to the power target flow (`power_enable_power_target_flow true`).

## Related Commands

- `set_power`

## power\_adjust\_macro\_activity\_in\_iterations

```
power_adjust_macro_activity_in_iterations {true | false}
```

*Default:* true

*Data\_type:* Boolean

Specifies whether to keep the macro activity fixed or automatically adjust the activity value for each iteration of state propagation. This attribute is only applicable to the power target flow (`power_enable_power_target_flow true`).

## Related Commands

- `set_power`

## power\_keep\_clock\_gate\_ratio\_in\_iterations

```
power_keep_clock_gate_ratio_in_iterations {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies whether to keep the clock gate output (CGO) fixed or automatically adjust the value for each iteration of state propagation. This attribute is only applicable to the power target flow (`power_enable_power_target_flow true`).

### Related Commands

- `set_power`

## power\_analysis\_temperature

```
power_analysis_temperature temperature
```

*Default:* -274.000000

*Data\_type:* Double

Specifies the temperature for static power calculation.

**Note:** Static power calculation gets the temperature value of each instance from the following sources (in order of precedence):

- Instance temperature file
- `power_analysis_temperature` attribute
- The current operating condition temperature

### Related Commands

- `report_power`

## power\_annotation\_detail\_report

```
power_annotation_detail_report {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to generate a detailed annotation report per instance in the Vector Profiling flow (`power_method`

vector\_profile). When specified, it creates the `AnnotationDetail.rpt` file in the user-specified output directory.

## Related Commands

- `report_power`

## power\_auto\_twf\_delay\_annotation

```
power_auto_twf_delay_annotation {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to automatically detect the zero-delay vectors and perform delay annotation. As a result, you do not need to specify additional parameters

(`set_db power_use_zero_delay_vector_file` and `read_activity_file -zero_delay`) to indicate the vectors that have delay annotation. This attribute is applicable only to the [event-based power analysis flow](#).

## Related Commands

- `report_power`

## power\_average\_rise\_fall\_cap

```
power_average_rise_fall_cap {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to use the average of rise and fall capacitance from the liberty file.

## Related Commands

- `report_power`

## power\_block\_independent\_peakpower

```
power_block_independent_peakpower {true | false}
```

*Default:* false

*Data\_type*: Boolean

Specifies to identify the worst power interval of each block, and run power analysis of the full design using the worst interval of each block. This attribute allows you to perform power and current analysis for design blocks that have independent peak power intervals.

When set to `false`, power analysis is performed using the common worst interval found using simulation of all vectors together.

## Related Commands

- `report_power`

## power\_bulk\_pins

```
power_bulk_pins {bulk_pin_list}
```

*Default*: ""

*Data\_type*: String

Defines power and ground bulk LEF pins for the design.

Use this attribute when library cells have bulk pins defined in LEF but the liberty file does not contain power associated with these pins. If a liberty file does not have body bias definition, power analysis does not distribute power to the body bias domain.

## Related Commands

- `report_power`

## power\_capacity

*Default*: `low`

*Data\_type*: Enum

Enables segmented power processing. When this attribute is specified, the software performs concurrent processing of vector simulation annotation, power calculation, and report construction.

This attribute enables performance optimization with some trade-off on memory consumption and runtime. The arguments of `power_capacity` are:

- `low` - reduces memory for a flat run.
- `medium` - further reduces memory with moderate increase in runtime (1.2X).
- `high` - maximum memory reduction at about 2X runtime.

The `power_capacity` attribute is used for reducing memory when processing long simulation vectors. In case of the FSDB and SHM format activity file, the runtime can increase up to 2X.

## Related Commands

- `report_power`

## power\_case\_insensitive\_mapping

```
power_case_insensitive_mapping {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies whether the instance name mapping between the RTL netlist and GATE level netlist in the mapping file is case sensitive or not. When set to `true`, the name mappings are not case sensitive.

## power\_clock\_source\_as\_clock

```
power_clock_source_as_clock {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to use the correct clock frequency for activity calculation. If you stop the arrival of the clock signal by setting `set_case_analysis` to `false`, the transition density at the output net of the flop is calculated using the correct clock frequency instead of the default frequency.

## Related Commands

- `report_power`

## power\_comprehensive\_automapping

```
power_comprehensive_automapping {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to perform all-inclusive instance name mapping between the RTL netlist and GATE level netlist. When set to `true`, the software honors all possible naming rules (includes handling of characters like '[', ']', ':', '/', '\', '\_', ':', and handling of strings like "MBFF", "\_reg", "\_MB\_" etc.) for better annotation coverage.

This feature is applicable to both file-based mapping (`read_activity_map_file -rtl_to_gate | -two_column_mapping_file`) and automatic mapping (`power_enable_auto_mapping`).

When `power_comprehensive_automapping` is specified with either `-rtl_to_gate` or `-two_column_mapping_file`, the RTL mapping entries are given priority over the automatic rule-based mapping entries and are used to annotate the design objects.

## Related Commands

- `report_power`

## power\_compress\_reports

```
power_compress_reports {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to compress the power output files in the GNU Zip format. The compressed files will have the suffix `.gz`.

The possible arguments are:

- `true`: Sets the compression option with compression level 6
- `false`: default, no compression
- 1-9: the compression levels vary from 1 to 9. 1 provides the fastest compression speed but at a lower ratio, so the file size will be larger. 9 provides the highest compression ratio but at a lower speed.

## Related Commands

- `report_power`

## power\_constant\_override

```
power_constant_override {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to give higher precedence to propagated constants defined using the `set_case_analysis` command. It allows propagated constants to override global activity.

## Related Commands

- [report\\_power](#)

## power\_corner

`power_corner {min|max}`

*Default:* {}

*Data\_type:* String

Defines the library corner (for non-MMMC setup).

- `min` corner means power calculator will use min timing libraries for the power calculation.
- `max` corner means power calculator will use max timing libraries for the power calculation.

## Related Commands

- [report\\_power](#)

## power\_create\_driver\_db

`power_create_driver_db {true | false}`

*Default:* false

*Data\_type:* Boolean

Specifies to determine all the drivers/receivers on the ground net.

## Related Commands

- [report\\_power](#)

## power\_current\_generation\_method

`power_current_generation_method {avg | peak}`

*Default:* avg

*Data\_type:* String

Specifies the current waveform generation method during dynamic power analysis. The two possible arguments of this attribute are:

- `avg` - Specifies to use the average current value of each time step. The output current filename is `filename.ptiavg`. The default value is `avg`.
- `peak` - Specifies to use the peak current value of each time step. The output current filename is `filename.ptipeak`. It is recommended to use the `peak` method when using the Composite Current Source Power (CCSP) Liberty files.

## Related Commands

- `report_power`

## power\_db\_name

`power_db_name filename`

*Default:* ""

*Data\_type:* String

Specifies the name of the binary power database file (`filename.db`).

You can specify this attribute in scenarios where more than one db is generated and you need to track which one was generated in which mode when the restoring the db, or if your design has several blocks and analysis is done on one block all the time and all the databases are named `power.db`.

## Related Commands

- `report_power`

## power\_decap\_cell\_list

`power_decap_cell_list cell_list`

*Default:* ""

*Data\_type:* String

Specifies the physical only cells, such as decap cells, to include in the power report.

**Note:** This is only supported for Static Power Analysis.

## Related Commands

- `report_power`

## power\_default\_frequency

`power_default_frequency value`

*Default:* -1.0

*Data\_type:* Double

Specifies to set the default frequency in the MHz unit for net not annotated by TWF. You can specify a numerical value without unit.

### Related Commands

- `report_power`

## power\_default\_slew

`power_default_slew value`

*Default:* " "

*Data\_type:* String

Specifies to set the default slew in the ps unit for net not annotated by TWF. You can specify a numerical value without unit.

### Related Commands

- `report_power`

## power\_default\_supply\_voltage

`power_default_supply_voltage value`

*Default:* " "

*Data\_type:* String

Specifies to set a default voltage for power nets in a scenario where the power engine cannot determine the voltage of these nets. The default value of this attribute is 1.0.

### Related Commands

- `report_power`

## power\_detailed\_view\_current\_only

```
power_detailed_view_current_only {true | false}
```

*Default:* `true`

*Data\_type:* Boolean

Controls instance power reporting for cells that have power information available in PGV. When set to `true`, specifies to skip writing of the switching and leakage current and use only the internal current from DDV PGV. When set to `false`, specifies to report the switching and leakage current values in addition to the internal current from DDV PGV. If a cell is defined in both PGV and dotlib, leakage is computed from dotlib. It is recommended to set this attribute to `true` because that would prevent over-estimation of the instance current.

### Related Commands

- `report_power`

## power\_disable\_clock\_gate\_clipping

```
power_disable_clock_gate_clipping {true | false}
```

*Default:* `true`

*Data\_type:* Boolean

Specifies to enable clock gate output clipping so that the output transition density of an ICG cell does not exceed the input clock pin transition density.

### Related Commands

- `report_power`

## power\_disable\_leakage\_scaling

```
power_disable_leakage_scaling {true | false}
```

*Default:* `false`

*Data\_type:* Boolean

Specifies to exclude leakage power during scaling factor computation when target power is specified using the `set_power` command. When this option is set to `true`, the leakage power does not get scaled, and only the internal and switching components are scaled to meet the user-specified total power.

This attribute is relevant only for the `set_power` commands for which total power is specified, and has no

effect for the `set_power` command specified with the `-internal`, `-switching`, or `-leakage` parameters.

## Related Commands

- `report_power`

## power\_disable\_static

```
power_disable_static {true | false}
```

*Default:* false

*Data\_type:* Boolean

When set to `true` in the dynamic vector-based or dynamic vectorless flows, the command performs only dynamic analysis and turns-off static power calculation.

## Related Commands

- `report_power`

## power\_distribute\_switching\_power

```
power_distribute_switching_power {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to equally distribute the switching power among all drivers if a net has more than one driver. When set to `false`, stores all switching power on one of the net drivers.

## Related Commands

- `report_power`

## power\_distributed\_combine\_report\_format

```
power_distributed_combine_report_format {none | detailed | reduced}
```

*Default:* reduced

*Data\_type:* String

Specifies to generate consolidated XP power reports. This parameter allows you to combine power

reports that are stored across multiple partition directories to give a single unified view of power data. The possible arguments of this parameter are:

- `none` - generates distributed reports.
- `reduced` - generates consolidated reports for the following:
  - `power.missingdata.*` (static and dynamic flows)
  - `power.stateprop.*` (dynamic flow)
  - `power.stats.setpower` (dynamic flow)
- `detailed` - generates consolidated reports for the following:
  - `power.rpt` (static and dynamic flows)
  - `power.instpwr.rpt` (static flow)
  - `power.lib.rpt` (static flow)
  - `power.pgpinpwr.rpt` (static flow)
  - `power.pgnet.detailed.rpt`
  - `power.missingdata.*` (static and dynamic flows)
  - `power.pgnet.detailed.rpt` (static and dynamic flows)
  - `power.stateprop.*` (dynamic flow)
  - `power.stats.setpower` (dynamic flow)
  - `pg_trigger.txt` (dynamic flow)
  - `trigger.txt` (dynamic flow)
  - `*.totalcurrent` (dynamic flow)
  - `voltus_power.cellstat` (static and dynamic flows)
  - `voltus_power.ptifiles` (static and dynamic flows)

## Related Commands

- `report_power`

## power\_distributed\_setup

`power_distributed_setup file`

*Default:* ""

*Data\_type:* String

Specifies a file containing the customized setup details for running power analysis in the distributed mode.

The specified file has 4 columns:

```
INST/CELL <name> hier/block <power.inc>
```

where,

- `INST/CELL`: Keyword indicating cell or instance to be run in the distributed mode. Cell can be useful for repeated DEF blocks.
- `name` : Name of the hierarchical block or instance.
- `hier/block`: Keyword indicating hierarchy or block. `hier` implies that the full hierarchy will be preserved by including the DEFs from top to the block, and `block` implies that only the lower level DEF will be included
- `power.inc` : name of the power include file. This column is optional.

The unspecified instance/cell will be run with the top level as a single group. Each distributed block/instance should have corresponding TWF and SPEF to improve runtime.

**Note:** Each hierarchy or block will be run independently from other hierarchies/blocks, thus the external load or cell seen at the pin of the hierarchy/block can be different from flat analysis. If the partition boundary analysis is important, distributed processing is not recommended.

## Related Commands

- `report_power`

## power\_domain\_based\_clipping

```
power_domain_based_clipping {true | false}
```

*Default:* false

*Data\_type:* Boolean

Determines the frequency to be used to clip propagated activity that is too high. When set to `false`, the frequency of the fastest clock in the design is used. If you set this attribute to `true`, the fastest clock domain on the net is used to clip propagated activity.

## Related Commands

- `report_power`

## power\_dynamic\_glitch\_filter

`power_dynamic_glitch_filter value`

*Default:* -1.0

*Data\_type:* Double

Sets the absolute threshold time (in ns) for filtering glitches in net toggles. When you specify a time value for this parameter, glitches in net toggles that are equal to or smaller in width than the specified time value are removed.

### Related Commands

- `report_power`

## power\_enable\_auto\_queue

`power_enable_auto_queue {true | false}`

*Default:* false

*Data\_type:* Boolean

Specifies to automatically determine the queue for power jobs. This attribute is used in the Voltus-XP distributed power flow with hierarchical DEFs. In the XP flow, partitions are divided into multiple queues depending on the number of CPUs (For example, Default queue: 1 CPU, Small queue: 2 CPUs, Medium queue: 4 CPUs, Large queue: 8 CPUs, and so on). By default, all power partitions run on the same queue. When the attribute is set to `true`, the blocks can run on different queues depending on the size (number of instances) of the blocks. The `power_enable_auto_queue` attribute will be beneficial when there are uneven power block partitions. For example, if there are some blocks with 20-30M instances and there are some with 3-5M instances. Using this attribute, bigger blocks will be automatically assigned to a bigger queue, resulting in better runtime.

### Related Commands

- `report_power`

## power\_enable\_auto\_mapping

`power_enable_auto_mapping {true | false}`

*Default:* false

*Data\_type:* Boolean

Specifies to automatically perform instance name mapping between the RTL netlist and GATE level

netlist. This attribute allows you to map the RTL vector to the Gate level netlist without a mapping file.

You can use the `read_activity_file -name_mapping_rule <filename>` command parameter to specify a file containing customized or design-specific rules.

## Related Commands

- `report_power`

## power\_enable\_disk\_mapping

```
power_enable_disk_mapping {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to enable disk caching of the toggles. Therefore, the toggles are stored in the disk instead of keeping them in memory. This has made large vectors or long simulation duration runs possible even with lesser available memory. This attribute is only applicable to the event-based power analysis flow (`power_method event_based`) in the XP mode.

### Example:

The following command specifies to enable disk caching of toggles:

```
set_db power_method event_based power_enable_disk_mapping true power_enable_xp true
```

## Related Commands

- `report_power`

## power\_enable\_duty\_propagation\_with\_global\_activity

```
power_enable_duty_propagation_with_global_activity {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to propagate duty cycle with the global switching activity setting for all data nets in the dynamic vectorless analysis flow.

## Related Commands

- `report_power`

## power\_enable\_dynamic\_current\_slew\_load\_interpolation

```
power_enable_dynamic_current_slew_load_interpolation {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to use the charge-based slew load interpolation. When this attribute is set to `true`, Power Analysis takes dynamic currents from the 4 nearest slew/load values and performs either a 4-way (lower slew, lower load, upper slew, upper load) or a 2-way (lower slew, upper slew OR lower load, upper load) interpolation to calculate the dynamic current waveform. The attribute allows you to derive a more realistic dynamic current waveform based on the exact slew load values from the .lib dynamic current table.

### Related Commands

- `report_power`

## power\_dynamic\_scale\_clock\_by\_frequency

```
power_dynamic_scale_clock_by_frequency { freq_Afactor_Afreq_Bfactor_Bfreq_Cfactor_C... }
```

*Default:* ""

*Data\_type:* String

Specifies the scale factors for the clock frequency values. This parameter allows you to perform frequency scaling for clocks running at relatively low frequencies, thereby ensuring higher toggle coverage for limited simulation period. The parameter is applicable only to the dynamic vectorless flow. The following units are supported for frequency: Hz, KHz, MHz, and GHz.

### Related Commands

- `report_power`

## power\_dynamic\_scale\_clock\_by\_name

```
power_dynamic_scale_clock_by_name { clk_A factor_A clk_B factor_B clk_C factor_C ... }
```

*Default:* ""

*Data\_type:* String

Specifies the scale factors for the low frequency clocks. This parameter allows you to perform frequency scaling for clocks running at relatively low frequencies, thereby ensuring higher toggle coverage for limited simulation period. The parameter is applicable only to the dynamic vectorless flow. The following

units are supported for frequency: Hz, KHz, MHz, and GHz.

## Related Commands

- [report\\_power](#)

## power\_enable\_interactive\_reports

```
power_enable_interactive_reports {true | false}
```

*Default:* true

*Data\_type:* Boolean

Specifies to generate multiple dynamic reports based on the power analysis run done for a netlist. When this attribute is set to `true`, you can generate various types of power reports interactively using the `report_power` command without the need to perform power calculation on the same netlist again. The `power_enable_interactive_reports` attribute is useful when you need to generate reports for the unaltered netlist within the same power analysis session.

This attribute is applicable only to the event-based power analysis flow with area-based partitioning (`power_use_physical_partition`) in the XP mode.

### Example:

The following command specifies to enable interactive generation of power reports:

```
set_db power_method event_based power_use_physical_partition true power_partition_count 2
power_enable_interactive_reports true power_enable_xp true
```

## Related Commands

- [report\\_power](#)

## power\_enable\_mt\_state\_propagation

```
power_enable_mt_state_propagation {true | false}
```

*Default:* true

*Data\_type:* Boolean

Specifies to enable multi-threading in state propagation to help improve the runtime for large simulations. For example, when the attribute was specified for a design with 300 million instances and simulation duration of 120 microseconds, the runtime has improved from 21 hours to 1.5 hours.

This attribute is only applicable to the event-based power analysis flow (`power_method event_based`).

## Related Commands

- `report_power`

## power\_equivalent\_annotation

`power_equivalent_annotation {true | false}`

*Default:* false

*Data\_type:* Boolean

Specifies to enable equivalent annotation for Q or Qbar pins when only one of them is annotated.

## Related Commands

- `set_power`

## power\_dynamic\_vectorless\_ranking\_methods

`power_dynamic_vectorless_ranking_methods {load | clock | vector_activity}`

*Default:* ""

*Data\_type:* String

Specifies to change the ranking method from the default to the following:

- `load` - Prioritizes scheduling cells with higher fanout
- `clock` - Prioritizes scheduling cells associated with faster clocks
- `vector_activity` - Prioritizes scheduling cells with higher activity

## Related Commands

- `report_power`

## power\_enable\_dynamic\_scaling

`power_enable_dynamic_scaling {true | false}`

*Default:* false

*Data\_type:* String

Enables `set_power` scaling for dynamic power analysis. The power and scaling specifications are used

to scale dynamic current on both the power and ground currents of the specified instance/cell.

This attribute honors the user-defined average (static) power for leaf-level instances and hierarchies (instances/cells/modules) along with power net specification in the dynamic current scaling flows such that the average of the dynamic current is equal to the assigned average power. When you specify this attribute, the average of the dynamic current of these leaf-level instances will match the scaled static power numbers.

 This attribute is not supported in the state-propagation-based vectorless flow (`power_enable_state_propagation true`). It is applicable only to the probability-based vectorless flow.

## Related Commands

- `set_power`
- `report_power`

## power\_enable\_flop\_state\_propagation

```
power_enable_flop_state_propagation {true | false}
```

*Default:* `false`

*Data\_type:* Boolean

Enables accurate clock state propagation for sequential cells. When this attribute is set to `true`, flops propagate in a manner that toggles on the output pins are in sync with the clock. This attribute helps to align the output pins' toggles with the clock toggles.

## Related Commands

- `set_power`
- `report_power`

## power\_enable\_force\_propagation

```
power_enable_force_propagation {true | false}
```

*Default:* `false`

*Data\_type:* bool

Enables force propagation to ensure that the output toggles are according to the clock signal rather than

the input pin states. This attribute assigns clock activity to outputs when input propagation is not feasible, thereby enhancing overall activity.

## Related Commands

- `set_power`

## power\_enable\_generated\_clock

```
power_enable_generated_clock {true | false}
```

*Default:* `true`

*Data\_type:* Boolean

Specifies to get generated clock frequency during activity propagation for static power analysis.

## Related Commands

- `set_power`

## power\_enable\_input\_net\_power

```
power_enable_input_net_power {true | false}
```

*Default:* `false`

*Data\_type:* Boolean

Specifies to calculate the switching power of input nets.

## Related Commands

- `set_power`

## power\_enable\_multithread\_reports

```
power_enable_multithread_reports {true | false}
```

*Default:* `false`

*Data\_type:* Boolean

Specifies to enable multi-threading for generation of power calculation reports. When set to `true`, it improves the memory and runtime for power reporting in large designs with more than 100 million

instances.

## Related Commands

- `set_power`

## power\_enable\_power\_target\_flow

```
power_enable_power_target_flow {true | false}
```

*Default:* `false`

*Data\_type:* Boolean

Specifies to enable the power target flow. When set to `true`, the tool allows you to specify power targets for full-chip power analysis. You can use the `set_power` command to specify the power targets for full-chip, physical block, logical block, and power/ground net. When these targets are specified, Voltus will automatically scale the toggle rates of clock gate ratio, input, macro, and sequential activities to meet the specified power targets.

## Related Commands

- `set_power`

## power\_enable\_pba\_for\_tempus\_pi

```
power_enable_pba_for_tempus_pi {true | false}
```

*Default:* `true`

*Data\_type:* Boolean

Specifies to enable the Path-Based Analysis (PBA) for slack calculation in the Tempus Power Integrity (Tempus PI) flow. By default, the Graph-Based Analysis (GBA) is used. This attribute is only applicable to the state-propagation-based vectorless flow (`set_db power_method dynamic_vectorless power_enable_state_propagation true`).

## Related Commands

- `set_power`

## power\_enable\_rtl\_dynamic\_vector\_based

```
power_enable_rtl_dynamic_vector_based {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to take an RTL or partial VCD/FSDB file as input and use that for dynamic vector-based flow. This attribute allows you to estimate current even for instances which are missing from the activity file.

You must use this attribute in conjunction with the `power_method dynamic_vectorbased` attribute.

## Related Commands

- `set_power`

## power\_enable\_scan\_report

```
power_enable_scan_report {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to generate all the scan mode analysis reports. The following reports will be generated:

- `voltus_power.scanff.duplicated.rpt` - flip-flops that are specified in multiple chains
- `voltus_power.scanff.missing.rpt` - flip-flops that are missing in the scan control file but exist in the design
- `voltus_power.scanff.nonassigned.rpt` - flip-flops that do not exist in the design and are dropped from the scan control file
- `voltus_power.scanff.nonscan.rpt` - assigned flip-flops that have no scan-out pin
- `voltus_power.scanff.nonswitched.rpt` - non-switching flip-flops in the scan control file
- `voltus_power.scanff.rpt` - detailed scan chain report containing global statistics for all scan chains and statistics for each scan chain in the design
- `voltus_power.scanff.stateconflict.rpt` - flip-flops that have conflicting state assignment

## Related Commands

- `set_power`

## power\_enable\_single\_cycle\_scheduling

```
power_enable_single_cycle_scheduling {true | false}
```

*Default:* `false`

*Data\_type:* Boolean

Schedules macro instances in every dominant clock cycle in the dynamic vectorless flow. This attribute can be used achieve faster toggle coverage. After the scheduling of every instance and attaining the maximum toggle coverage, the scheduler cycles back to the same switch source element and then schedules it again with the opposite polarity. This attribute helps in achieving the same toggle coverage within half the simulation period compared to dual cycle scheduling.

When the attribute is set to `false`, the macros are scheduled every two cycles wherein the adjacent cycle is used for reversing the transition polarity.

This is a root attribute.

- To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

- To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

## Related Commands

- `set_power`

## power\_enable\_slew\_based\_ccs\_pin\_cap

```
power_enable_slew_based_ccs_pin_cap {true | false}
```

*Default:* `false`

*Data\_type:* Boolean

Specifies to use the Composite Current Source (CCS) capacitance value based on the slew given in the input pin section of the library cell in the Liberty file. If it is set to `true`, the tool honors the CCS pin capacitance; if it is set to `false`, it takes `max_capacitance` from `.lib`. This attribute can be used when timing windows and/or a Tempus timing session is not available.

## Related Commands

- `set_power`

## power\_enable\_state\_propagation

```
power_enable_state_propagation {true | false}
```

*Default:* `false`

*Data\_type*: Boolean

Specifies to enable the vectorless state-propagation-based dynamic analysis flow.

For more information, refer to the *State-Propagation-Based Vectorless Methodology* section in the "*Dynamic Power and IRDrop Analysis*" chapter of the *Voltus User Guide*.

## Related Commands

- `set_power`

## power\_enable\_stable\_clock\_gating

```
power_enable_stable_clock_gating {true | false}
```

*Default*: false

*Data\_type*: Boolean

Perform balanced scheduling of ICGs independent of the predecessor ICG state.

This attribute is used for the state-propagation-based vectorless flow (`set_db power_method dynamic_vectorless power_enable_state_propagation true`) only.

## Related Commands

- `set_power`

## power\_enable\_stable\_flop\_scheduling

```
power_enable_stable_flop_scheduling {true | false}
```

*Default*: false

*Data\_type*: Boolean

Perform balanced scheduling of flops independent of the ECOs done on the design.

This attribute is used for the state-propagation-based vectorless flow (`set_db power_method dynamic_vectorless power_enable_state_propagation true`) only.

## Related Commands

- `set_power`

## power\_enable\_tempus\_pi

```
power_enable_tempus_pi {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to enable the Tempus PI analysis flow. When this attribute is set to `true`, data path scheduling is timing-aware, that is, scheduling is based on timing slacks. This attribute is only applicable to the state-propagation-based vectorless flow (`set_db power_method dynamic_vectorless power_enable_state_propagation true`).

For more information, refer to the **Tempus Power Integrity Analysis** chapter in the *Tempus User Guide*.

### Related Commands

- [set\\_power](#)

## power\_enable\_xp

```
power_enable_xp {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to run standalone report generation in the XP mode.

### Related Commands

- [set\\_power](#)

## power\_enhanced\_blackbox\_avg

```
power_enhanced_blackbox_avg {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to use the average toggle rate of related inputs for enhanced blackbox propagation.

### Related Commands

- [set\\_power](#)

## power\_enhanced\_blackbox\_max

```
power_enhanced_blackbox_max {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to use the maximum toggle rate of related inputs for enhanced blackbox propagation.

### Related Commands

- [set\\_power](#)

## power\_event\_based\_leakage\_power

```
power_event_based_leakage_power {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to calculate state-dependent leakage power. When this attribute is set to `true`, it calculates leakage power and current based on the state of an instance at each time point.

For example, at time 0ns, instance instA is in state !!ZN (0 on input, 1 on output), and at time 71ns, the instance is in state I!ZN ( 1 on input, 0 on output). The leakage power is calculated based on the different states of instA at different time points.

### Related Commands

- [set\\_power](#)

## power\_external\_load\_config\_file

```
power_external_load_config_file filename
```

*Default:* " "

*Data\_type:* String

Specifies to honor the user-specified load capacitance values for power calculation. This attribute allows you to specify an external load capacitance file when you have a timing window file without the `EXTERNAL_LOAD` constructs.

### File Format:

The format of the user-specified input file is:

```
INST|CELL blockName external_load_file
```

Here, the format of *external\_load\_file* is:

```
NET|PORT name load_value
```

### Examples:

#### Configuration file:

```
INST TOP top_wcard.load
```

#### External load file (*top\_wcard.load*):

```
UNIT pF
NET result 0.02
NET overflow 0.02
```

### Related Commands

- [set\\_power](#)

## power\_extraction\_tech\_file

```
power_extraction_tech_file filename
```

*Default:* " "

*Data\_type:* String

Specifies the extraction technology file to be used for top-level power-grid extraction.

### Related Commands

- [set\\_power](#)

## power\_extractor\_include

```
power_extractor_include filename
```

*Default:* " "

*Data\_type:* String

Specifies the extractor (ZX) commands and variables in the form of an include file. This parameter is applicable only for the standalone report generation flow in the XP mode (*power\_enable\_xp true*).

## Related Commands

- `set_power`

## power\_fanout\_limit

`power_fanout_limit value`

*Default:* -1

*Data\_type:* Integer

Specifies the fanout limit for nets. If an instance has nets more than or equal to the fanout limit, its switching/internal/leakage power is taken to be zero.

## Related Commands

- `set_power`

## power\_force\_library\_merging

`power_force_library_merging {true | false}`

*Default:* false

*Data\_type:* Boolean

Specifies to force merge PGVs even if there are some minor conflicts in the merging libraries. This parameter is applicable only for the standalone report generation flow in the XP mode (`power_enable_xp true`).

## Related Commands

- `set_power`

## power\_from\_x\_transition\_factor

`power_from_x_transition_factor value`

*Default:* 0.5

*Data\_type:* Double

Specifies how transitions from X to 0/1 are counted.

## Related Commands

- [set\\_power](#)

## power\_from\_z\_transition\_factor

`power_from_z_transition_factor value`

*Default:* 0.25

*Data\_type:* Double

Specifies how transitions from Z to 0/1 are counted.

## Related Commands

- [set\\_power](#)

## power\_generate\_flop\_ranking\_data

`power_generate_flop_ranking_data directoryname`

*Default:* ""

*Data\_type:* String

Specifies the name of the directory where the flop ranking data is saved.

## Related Commands

- [set\\_power](#)

## power\_generate\_activity\_mapping\_report

`power_generate_activity_mapping_report {true | false}`

*Default:* false

*Data\_type:* Boolean

Specifies to generate the `activity_mapping.rpt` report in the vector-based dynamic power flow. This report gives the list of signal name mappings between the Golden (RTL netlist - input name in the vector file) and Revised (Gate netlist - annotated design object name) netlists that were used in the flow. The report displays the list of annotated and unannotated objects and helps to debug the mapping file for unannotated design objects.

`activity_mapping.rpt` supports activity mapping done through the following methods:

- User-specified mapping file (`read_activity_map_file -two_column_mapping_file`)
- Conformal-generated RTL mapping file (`read_activity_map_file -rtl_to_gate`)
- Voltus auto-generated mapping file (`power_enable_auto_mapping`).

## Related Commands

- `set_power`

## power\_generate\_current\_for\_rail

```
power_generate_current_for_rail railnames
```

*Default:* ""

*Data\_type:* String

Generates current files for the specified rail.

By default, the command generates current files for all power rails.

## Related Commands

- `set_power`

## power\_generate\_static\_report\_from\_state\_propagation

```
power_generate_static_report_from_state_propagation {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to directly generate the static power analysis result based on the RTL-VCD input and state-propagation. When this attribute is specified, the RTL vector power analysis flow does not require the generation of a TCF/FSDB file. This attribute is applicable only to the RTL vector-based dynamic power analysis flow.

## Related Commands

- `set_power`

## power\_generate\_leakage\_power\_map\_based\_on\_calculated\_leakage

```
power_generate_leakage_power_map_based_on_calculated_leakage {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to scale the instance leakage power by directly multiplying the user-specified scaling factor with the final calculated leakage power value, instead of scaling the leakage power value from the input dotlib.

If this parameter is not specified, the user-specified scaling factor will be applied on the leakage power values from the input dotlib.

### Related Commands

- [set\\_power](#)

## power\_grid\_libraries

```
power_grid_libraries library_list
```

*Default:* ""

*Data\_type:* String

Specifies the name of the Cadence power cell libraries (.cl). You can also specify a list of defined power-grid libraries having decap cells tagged in them.

**Note:** When specifying a list of PGVs, you must specify the technology library as the first PGM library in the list, followed by the standard and macro PGM libraries. The selection between the standard and macro PGM library is order based. Therefore, if multiple power-grid libraries are specified for a cell, the power engine maps the cell with the first library after the technology library.

### Related Commands

- [set\\_power](#)

## power\_handle\_glitch

```
power_handle_glitch {true | false}
```

*Default:* false

*Data\_type:* Boolean

A transition is defined as a glitch when the time difference between two sequential toggles are less than

half of the rise transition time + fall transition time in the vector-based static power calculation.

If set to `true`, glitch power will be identified and calculated according to this definition and it will be reported in a separate column. Switching or internal power calculation does not include power due to glitches.

If set to `false`, glitch power will not be identified, and the respective power will be calculated as normal signal switches. Hence, the total power will be a little higher.

## Related Commands

- `set_power`

## power\_handle\_transport\_glitch

```
power_handle_transport_glitch {true | false}
```

*Default:* `false`

*Data\_type:* Boolean

Transport glitch is referred to as functional toggles for a net in a single clock period before it reaches a stable value. You can use this attribute to report the internal and switching power values for transport glitch.

The transport glitch power is reported in the following reports:

- Average Power Summary Report (`power.rpt.avgpwr`) - reported in the Total, Group, Clock, and Rail power sections.
- Instance Power Report (`power.rpt.instpwr`) - reported for all instances.
- Hierarchy Power Report (`power.rpt.hierpwr`) - reported for all hierarchies.

This attribute is automatically set to `true` with `power_handle_glitch true`. That is, reports both inertial and transport glitch power. When set to `false`, only the inertial glitch power is reported.

## Related Commands

- `set_power`

## power\_handle\_tristate

```
power_handle_tristate {true | false}
```

*Default:* `false`

*Data\_type:* Boolean

When set to `true`, all tristate device enable pin values will be taken into account when determining the propagation of the activity through tristate gates.

## Related Commands

- `set_power`

## power\_hier\_delimiter

`power_hier_delimiter` *character*

*Default:* " "

*Data\_type:* String

Specifies the hierarchical delimiter in the DEF file. You can use this attribute to override the existing hierarchical delimiter.

## Related Commands

- `set_power`

## power\_honor\_combinational\_logic\_on\_clock\_net

`power_honor_combinational_logic_on_clock_net` {`true` | `false`}

*Default:* `true`

*Data\_type:* Boolean

Specifies the behavior of combination logic on clock net.

- `true` (default) - specifies to honor activity propagation through combinational logic.
- `false` - specifies that the combination logic will be treated like a combinational clockgate.

## Related Commands

- `set_power`

## power\_honor\_default\_switching\_activity\_in\_scheduling

`power_honor_default_switching_activity_in_scheduling` {`true` | `false`}

*Default:* `false`

*Data\_type*: bool

Controls whether default switching activity settings are applied during hierarchy/domain-based scheduling. This attribute must be used for switching activity assignment using the `set_default_switching_activity -pg_net` or `-hierarchy` parameters in the dynamic vectorless flow.

This is a root attribute.

- To set the value of any root attribute, use the `set_db` command:  
`set_db attribute_name value`
- To get the current value of any root attribute, use the `get_db` command:  
`get_db attribute_name`

## Related Commands

- `set_power`

## power\_honor\_negative\_energy

```
power_honor_negative_energy {true | false}
```

*Default*: true

*Data\_type*: Boolean

A value of `true` specifies that the software will keep negative internal energy numbers from the `.lib` internal power table. When set to `false`, negative power is treated as 0.

## Related Commands

- `set_power`

## power\_honor\_net\_activity

```
power_honor_net_activity {true | false}
```

*Default*: true

*Data\_type*: Boolean

Specifies to use activity from the `Net` section of the Switching Activity Interchange Format (SAIF) file for power calculation and optimization, and to ignore the pin-based state-dependent path delay (SDPD) activity. The default value of this attribute is `true`.

When this attribute is set to `false`, the power calculation engine can use both the net-based and pin-based activity. In this case, precedence will be given to activity from net or pin that appears later in the

SAIF file.

## Related Commands

- `set_power`

## power\_honor\_non\_mission\_leakage

```
power_honor_non_mission_leakage {true | false}
```

*Default:* false

*Data\_type:* Boolean

Supports modeling of well-to sub-leakage information when the circuit power supply is off for the level shifter cells. This is referred to as the non-mission mode leakage power calculation. The leakage power for a level shifter cell depends on the state of each PG pin. The Liberty file contains sections for PG pin conditions of each mode/state and non-mission mode leakage power for each PG pin of that mode.

When this attribute is set to `true`, the software identifies the `pg_pin` mode and assigns non-mission mode leakage power associated with the mode.

The use model of the non-mission mode leakage power calculation feature is:

```
power_honor_non_mission_leakage true
power_off_pg_nets {VDD VDDO}
```

### Example:

Let us consider a level shifter cell with the PG mode “`retained_VDDO_off`” and the following `pg_pin_condition`:

```
pg_setting_value (retained_VDDO_off) {
pg_pin_condition : "!VBB*VDD*VDDI ";
pg_pin_active_state (VBB, V1);
pg_pin_active_state (VDD, V2);
pg_pin_active_state (VDDI, V2);
```

When you specify a list of PG nets to be turned off along with the `power_honor_non_mission_leakage` attribute, all cells/instances that have the PG state “`retained_VDDO_off`” associated with the specified PG pin condition, will use the corresponding non-mission leakage power.

## Related Commands

- `set_power`

## power\_hybrid\_analysis

```
power_hybrid_analysis {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to perform both vector-based and vectorless power analysis in a single session.

### Related Commands

- [set\\_power](#)

## power\_ignore\_control\_signals

```
power_ignore_control_signals {true | false}
```

*Default:* true

*Data\_type:* Boolean

A value of `true` specifies that control signals will be ignored when propagating activity.

### Related Commands

- [set\\_power](#)

## power\_ignore\_data\_phase\_for\_clock

```
power_ignore_data_phase_for_clock {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to ignore data frequency in the clock path for the clock instances in the design. When this attribute is set to `true`, the software propagates only the fastest clock pin frequency instead of the data pin frequency for activity propagation through clock network. In the default mode, the software picks the fastest frequency between the data phase and clock phase on that pin.

### Related Commands

- [set\\_power](#)

## power\_ignore\_end\_toggles\_in\_profile

```
power_ignore_end_toggles_in_profile {true | false}
```

*Default:* false

*Data\_type:* Boolean

By default, the software profiles the toggles in the user-selected vector time window by steps including the toggles at the start/end boundary of the window. In each step, the toggles on the start boundary edge of the step is counted in the current step; the toggles on the end boundary edge is counted in the next step.

When this attribute is set to `false`, the toggles on the end boundary edge is also counted in the last step, as there is no next step to it. This may lead to double count of the power profile for the last step, especially for zero-delay vector profiling.

When this attribute is set to `true`, the software ignores the toggle on the end boundary of the last step.

### Related Commands

- [set\\_power](#)

## power\_ignore\_glitches\_at\_same\_time\_stamp

```
power_ignore_glitches_at_same_time_stamp {true | false}
```

*Default:* true

*Data\_type:* Boolean

Specifies to ignore glitches at the same transient time in the vector-based static and dynamic power analysis flow. When this attribute is set to `true`, only the last signal value change is honored, and all the preceding value changes at the same time stamp are ignored. The last signal value will overwrite the previous value for the same signal at the same time stamp, so the last value will represent the state of the signal at that time stamp.

### Related Commands

- [set\\_power](#)

## power\_ignore\_inout\_pin\_cap

```
power_ignore_inout_pin_cap {true | false}
```

*Default:* false

*Data\_type*: Boolean

When set to `true`, ignores the bidirectional pin capacitances (`direction : inout`) defined for I/O cells in the .lib file, when calculating switching power and internal power; this also includes the default capacitance value for `inout` pins.

## Related Commands

- `set_power`

## power\_ignore\_macro\_leakage\_scale\_for\_temperature

```
power_ignore_macro_leakage_scale_for_temperature {true | false}
```

*Default*: `false`

*Data\_type*: Boolean

The `power_leakage_scale_factor_for_temperature` attribute is used to perform linear scaling of the leakage power for temperature in both the standard cell and macro libraries.

The `power_ignore_macro_leakage_scale_for_temperature` attribute allows you to selectively apply the scale factor only for standard cells, and not use the scale factor for macro cells.

## Related Commands

- `set_power`

## power\_ignore\_unconstraint\_net\_with\_timing\_data

```
power_ignore_unconstraint_net_with_timing_data {true | false}
```

*Default*: `false`

Specifies to ignore unconstrained nets/pins from toggle generation. These nets/pins do not have an associated clock but contain valid timing data with arrival windows in the TWF file. If set to `false`, the tool applies default frequency toggles to these unconstrained nets, which could cause false IR violation warnings due to high voltage drop.

## Related Commands

- `set_power`

## power\_include\_file

```
power_include_file file
```

*Default:* " "

*Data\_type:* String

Specifies a power analysis include file. You can use this file to specify certain commands of the dynamic engine which do not have a Voltus equivalent. This attribute is used to pass the legacy power analysis commands and `report_power` command options only in the dynamic mode (vectorbased and vectorless). If the `power_method` attribute is set to `static`, the `power_include_file` attribute is ignored. The `power_include_file` attribute is required only if the `power_static_netlist` attribute is set to `def`.

### Related Commands

- `set_power`

## power\_include\_initial\_x\_transitions

```
power_include_initial_x_transitions {true | false}
```

*Default:* true

*Data\_type:* Boolean

Controls how the initial X state toggle should be counted. The initial X state means the state at time 0.

When set to `true`, this means that the software counts the power caused by the `X->0` or `X->1` toggle. When set to `false`, the software does not count the power caused by the initial X state toggle.

### Related Commands

- `set_power`

## power\_include\_sequential\_clock\_pin\_power

```
power_include_sequential_clock_pin_power {true | false}
```

*Default:* false

*Data\_type:* Boolean

Reports the clock pin power of flip-flops as part of the clock network power.

## Related Commands

- [set\\_power](#)

## power\_include\_timing\_in\_current\_file

```
power_include_timing_in_current_file {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to write timing bits for non-switching instances in the current files during the state-propagation-based flow. When specified, rail analysis will report effective instance voltage (EIV) for both switching and non-switching instances. If the parameter is set to `false`, rail analysis will report EIV for the switching instances only.

## Related Commands

- [set\\_power](#)

## power\_ir\_derated\_timing\_view

```
power_ir_derated_timing_view view_name
```

*Default:* " "

*Data\_type:* String

Specifies the name of the timing view used to calculate timing slack and to rank the flops in the Tempus PI flow. This attribute must be specified if there are multiple views.

The `power_ir_derated_timing_view` attribute defines the timing view used to detect the IR-sensitive paths using a lower voltage than the actual analysis. This lower voltage simulates the IR-drop for each instance in the design. The software uses this view to prioritize the end-points that need to be prioritized for switching.

This attribute is only applicable to the state-propagation-based vectorless flow (`set_db power_method dynamic_vectorless power_enable_state_propagation true`).

## Related Commands

- [set\\_power](#)

## power\_leakage\_scale\_factor\_for\_temperature

`power_leakage_scale_factor_for_temperature view_name`

*Default:* 1.0

*Data\_type:* Double

Performs a linear scaling of the leakage power for temperature in all libraries. This replaces the k-factor for temperature in the .lib file. For process and voltage, the scaling will continue to be based on the corresponding k-factors in the .lib file. A value of 0.8 scales the leakage power in the library to 80 percent. A value of 1.2 scales the leakage power in the library to 120 percent.

### Related Commands

- `set_power`

## power\_lib\_files

`power_lib_files in_file <file1[file2] ...`

*Default:* ""

*Data\_type:* String

Specifies the name of the timing library file(s) for dynamic power analysis. This attribute allows you to run the dynamic power analysis flow without reading a dotlib into design database to reduce background memory consumption. You must have an external TWF file to run this flow as the timing engine will not be invoked from within Voltus. This flow is recommended for large designs where front-end processing of timing libraries is high. Some of the database query commands will not work if this attribute is used.

### Related Commands

- `set_power`

## power\_library\_preference

`power_library_preference {voltage | ecdsm_ccsp}`

*Default:* voltage

*Data\_type:* String

Instances of the same cell can be attached to different power domains in a design. If you have specified different PVT libraries, then the software will by default bind each instance to the closest library definition.

You can use this attribute to select either the closest Effective Current Source Model (ECSM)/Composite Current Source-power (CCSP), or the closest voltage library for the instance:

- `voltage`: when specified, enables library binding to the closest voltage library.
- `ecsm_ccsp`: when specified, enables library binding to the closest ECSM/CCSP library.

## Related Commands

- `set_power`

## power\_macro\_pgv\_leakage

```
power_macro_pgv_leakage {true | false}
```

*Default:* `true`

*Data\_type:* Boolean

Controls leakage power reporting for cells that have power information available in both dotlib and PGV. When the attribute is set to `false`, the leakage current from Liberty is used and when the attribute is set to `true`, the leakage current from PGV is used.

## Related Commands

- `set_power`

## power\_macro\_toggle\_pin\_percentage

```
power_macro_toggle_pin_percentage percentage
```

*Default:* `0.0`

*Data\_type:* Double

Specifies the percentage of output data pins (ignoring the control pins) to be scheduled for a macro cell. This attribute is applicable to the state-propagation based vectorless flow. The default macro pin toggle percentage is 50%.

## Related Commands

- `set_power`

## power\_match\_state\_for\_logic\_x

`power_match_state_for_logic_x value`

*Default:* `x`

*Data\_type:* String

Controls how the logic X will be evaluated in the boolean function of the 'when' state of a power table.

The attribute uses the following arguments:

- `0` - regards X as 0
- `1` - regards X as 1
- `x/x` - regards X as neither 0 nor 1, that is, whenever there is any X logic in it, the boolean function will be evaluated 0 (false).

### Related Commands

- `set_power`

## power\_memory\_current\_scaling\_method

`power_memory_current_scaling_method {1 | 2 | 3}`

*Default:* `0`

*Data\_type:* Integer

Specifies to enable scaling of the NLPM-based currents by a user-specified scale factor for macro cells that are switching. The applicable arguments are 1, 2, and 3, which means enable a scaling factor of 0.5, 0.25, and 0.1 respectively.

### Related Commands

- `set_power`

## power\_multibit\_flop\_toggle\_behavior

`power_multibit_flop_toggle_behavior { simultaneous | independent | sbff }`

*Default:* `independent`

*Data\_type:* Enum

Specifies the toggle behavior of multi-bit flip-flops (MBFF). The possible arguments are:

- `simultaneous`: The multiple bits of the MBFF will toggle or not toggle at the same time. The MBFF will be considered as one flip-flop.
- `independent`: The multiple bits of the MBFF will toggle independently. The MBFF will be considered as one flip-flop.
- `sbff`: The MBFF will be considered as multiple Single-Bit Flip-Flops (SBFFs). Each bit will be considered as one flip-flop, and will toggle independently.

## Related Commands

- `set_power`

## power\_multibit\_flop\_toggle\_pin\_percentage

`power_multibit_flop_toggle_pin_percentage percentage`

*Default:* 0.0

*Data\_type:* Double

Specifies the percentage of multi-bit flip-flops (MBFF) pins to be scheduled. This attribute is applicable to the state-propagation based vectorless flow. The attribute will only work when `power_multibit_flop_toggle_behavior` is set to `independent`.

## Related Commands

- `set_power`

## power\_multi\_scenario\_simulation

`power_multi_scenario_simulation {true | false}`

*Default:* false

*Data\_type:* Boolean

Specifies to create a long vector by combining multiple vectors and to identify the worst power intervals across the combined vector. The long vector includes all scenarios that are used sequentially and are non-overlapping.

This attribute allows you to perform power and current analysis using worst peak power interval across multiple simulation vectors.

## Related Commands

- `set_power`

## power\_off\_pg\_bulk\_leakage

```
power_off_pg_bulk_leakage { true | false }
```

*Default:* false

*Data\_type:* bool

Specifies to account for the leakage power through an instance's bulk pin when it is connected to a power-ground (PG) rail in the ON state.

The following diagram illustrated that the instance contributes bulk pin leakage to the ON state rail (**vdd**) through the *VBP* pin and zero leakage to the OFF state rail (*vddlsw*) through the VDD pin.

## Related Commands

- `set_power`

## power\_merge\_switched\_net\_currents

`power_merge_switched_net_currents {true | false}`

*Default:* false

*Data\_type:* Boolean

Specifies to merge switched net currents into always-on currents. For designs with a large number of switched nets, this attribute helps improve performance by merging switched net instance currents with always-on instance currents. However, when this attribute is set to `true`, you will not be able to use the generated current files to run power-up analysis.

## Related Commands

- `set_power`

## power\_method

`power_method { static | dynamic_vectorless | dynamic_vectorbased | dynamic_mixed_mode }`

*Default:* static

*Data\_type:* Enum

Specifies the type of analysis to be performed. You can perform two types of power analysis, namely static and dynamic.

- `static` - specifies to perform static power analysis to calculate average power.

Dynamic power analysis can be a vector-based or vectorless approach.

- `dynamic_vectorbased` - uses the full VCD output of a logic simulator to identify the instances that are switching and when they switch.
- `dynamic_vectorless` - uses the timing arrival window information from a static timing analysis tool to determine when instances switch. A timing arrival window describes when a signal can change within a clock cycle. An additional algorithm then determines the instances that switch.
- `dynamic_mixed_mode` - specifies to combine the vector-based and vectorless (mixed) dynamic analysis. This flow can be used in the following cases:
  - **case 1:** vectors are not available for every block of a full-chip design.  
In this case, the software uses the vectorless methodology for blocks with incomplete vectors
  - **case 2:** blocks with vectors having unannotated combinational/ sequential logic.  
In this case, the software performs state propagation for the missing combinational/ sequential logic. It uses the vectorless methodology for a logic cone that does not have the primary inputs or flops annotated from the vector, and then performs state propagation

To enable the dynamic mixed mode analysis flow, you must specify the following commands:

```
set_default_switching_activity -clock_gates_output 2.0 -global_activity <activity>
set_db power_method dynamic_mixed_mode
read_activity_file -scope <> -block <> -> (for available blocks)
```

## Related Commands

- `set_power`

## power\_min\_leaf\_count

```
power_min_leaf_count value
```

*Default:* 0

*Data\_type:* Integer

Specifies the minimum number of leaf instances required for writing the hierarchy data in the profiling database. It allows you to restrict the number of hierarchies for which waveforms are reported in the profiling database when using both the `power_write_profiling_db` attribute and `report_power - hierarchy` parameters.

Any hierarchy whose leaf instance count in its complete sub-tree is less than the `power_min_leaf_count` value will be skipped from getting reported in the profiling database. This attribute can be used to skip

very small hierarchies and as a result save on the database writing time and disk space.

## Related Commands

- `set_power`

## power\_off\_pg\_nets

`power_off_pg_nets net_list`

*Default:* ""

*Data\_type:* String

The name of the power rails that will be turned off. The net name can contain instance hierarchy if appropriate. The software will take this data into account when figuring out the list of power gates which are switched off.

**Note:** A net is turned off if all connected power gates are turned off by control signals. When a net is off, all of the instances connected to the net will only contribute leakage current into the connecting nets.

## Related Commands

- `set_power`

## power\_output\_current\_data\_prefix

`power_output_current_data_prefix prefix`

*Default:* ""

*Data\_type:* String

Specifies a prefix to the static or dynamic current files generated by the software. When power analysis is done in the multi-CPU mode, the output current data directory name and the underlying current files will also use the same prefix by default.

## Related Commands

- `set_power`

## power\_output\_dir

`power_output_dir directory`

*Default:* ""

*Data\_type:* String

Specifies the name of the directory that power information will be output to.

## Related Commands

- [set\\_power](#)

## power\_partition\_count

```
power_partition_count value
```

*Default:* 0

*Data\_type:* Integer

Specifies the number of physical partitions or jobs for a distributed run in the area-based partitioning flow. This attribute is only applicable to the event-based power analysis flow ([power\\_method event\\_based](#)) in the XP mode. The `power_partition_count` attribute must be specified with the `power_use_physical_partition` attribute.

## Related Commands

- [set\\_power](#)

## power\_partition\_spef

```
power_partition_spef {true | false}
```

*Default:* false

Specifies to generate block-level SPEF files from a flat SPEF file. This attribute allows you to process input SPEF data and automatically generate partition-level SPEF chunks. The attribute is supported only in the XP mode for full-chip designs using flat SPEF files.

The use model of this attribute is:

```
set_power_spef_files { flat.spef.gz }
set_db power_partition_spef true
```

## Related Commands

- [set\\_power](#)

## power\_partition\_twf

```
power_partition_twf {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to read the input TWF data (flat or hierarchical TWF files), and generate block-level TWFs. This attribute must be specified when the block/partition level TWF files are not available.

### Related Commands

- `set_power`

## power\_pin\_based\_twf

```
power_pin_based_twf {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies whether to generate pin-based TWF or net-based TWF.

- When set to `false`, a net-based TWF file is generated. Net-based TWF file is smaller in size and therefore results in faster processing.
- When set to `true`, a pin-based TWF file is generated. Pin-based TWF file is bigger in size and requires longer processing time, however, is more accurate because the slews numbers are pin-based.

**Note:** This attribute must be used with the `read_sdc` command.

### Related Commands

- `set_power`

## power\_precision

```
power_precision value
```

*Default:* 8

*Data\_type:* Integer

Specifies precision of decimal range [1-8] to ensure consistent decimal places are displayed for each power component. This attribute is used for precision handling in `report_instance_power` and

report\_power.

## Related Commands

- [report\\_power](#)

## power\_pre\_simulation\_empty\_period

power\_pre\_simulation\_empty\_period *value*

*Default:* ""

*Data\_type:* String

Specifies to add an empty pre-simulation period before simulation during IR drop analysis. Power analysis is not done for the pre-simulation period and flat dynamic currents are created.

## Related Commands

- [report\\_power](#)

## power\_pre\_simulation\_period

power\_pre\_simulation\_period *value*

*Default:* ""

*Data\_type:* String

Specifies to set a pre-simulation period for IR drop analysis. Pre-simulation is used for generating power analysis reports and dynamic currents.

## Related Commands

- [report\\_power](#)

## power\_pre\_simulation\_power\_exclude\_period

power\_pre\_simulation\_power\_exclude\_period *value*

*Default:* ""

*Data\_type:* String

Specifies to exclude power analysis during the pre-simulation period used for IR drop analysis. Pre-

simulation is used only to create dynamic currents and not used for power reports.

## Related Commands

- `report_power`

## power\_quit\_on\_activity\_coverage\_threshold

`power_quit_on_activity_coverage_threshold threshold_value`

Default: 0.0

*Data\_type*: Double

Specifies the activity (VCD/FSDB/TCF) coverage threshold value. This attribute allows you to control the acceptable activity coverage that you are expecting and enforce the software to quit when it does not meet the criteria. When you specify the threshold value, the software exits if the real activity coverage is below the threshold.

## Related Commands

- `report_power`

## power\_read\_rcdb

`power_read_rcdb {true | false}`

*Default*: false

*Data\_type*: Boolean

Specifies to write a SPEF file containing only the total C for signal nets and pass it to the Dynamic Power engine. Dynamic power analysis requires only the total C for signal nets. Therefore, instead of writing a large SPEF file (with distributed RC) from the RCDB, this attribute specifies to create and pass a SPEF file with only total C for all the signal nets. This significantly reduces the parasitic annotation time in the Dynamic Power engine.

## Related Commands

- `report_power`

## power\_relax\_arc\_match

`power_relax_arc_match {true | false}`

*Default:* `false`

*Data\_type:* Boolean

Specifies to relax arc match requirements. This attribute is used only when the exact arc is not found in a .lib. When set to `true`, the internal energy is calculated as an average of multiple arcs with relaxed arc matching. If this attribute is set to `false`, relaxed arc search is not done and 0 internal energy is returned.

## Related Commands

- `report_power`

## power\_report\_library\_usage

```
power_report_library_usage {true | false}
```

*Default:* `false`

*Data\_type:* Boolean

Specifies to report library usage statistics in a text report. The report contains information such as, cell name, library format used (CCSP/ECSM/NLPM) for each cell, library name, and so on. This attribute allows you to perform library integrity checking for debugging purpose.

The format of the text report with sample content is given below:

Example:

| #cell_name   | net_name  | op_voltage | lib_voltage | lib_format | missing_tables  |   |
|--------------|-----------|------------|-------------|------------|-----------------|---|
| library_name |           |            |             |            |                 |   |
| INV          | VDD, VDDA | 0.9        | 1.0         | NLDM       | leakage, timing | A |
| INV          | VDDC      | 0.75       | 0.75        | CCSP, NLDM | leakage         | B |

## Related Commands

- `report_power`

## power\_report\_missing\_bulk\_connectivity

```
power_report_missing_bulk_connectivity {true | false}
```

*Default:* `false`

*Data\_type:* Boolean

Specifies to report missing bulk pins in the missing input report (`power_report_missing_input`).

## Related Commands

- `report_power`

## power\_report\_missing\_input

```
power_report_missing_input {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to report missing netlist information in input files, such as library, LEF/DEF, PGV, SPEF, TWF, and missing logical connectivity for a cell instance (PGNET).

The name of the report file is: `<prefix>_missingdata.<spef|lefdef|lib|pgv|twf|pgnet>`

## Related Commands

- `report_power`

## power\_report\_black\_boxes

```
power_report_black_boxes {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to report cells that are used as black boxes.

A black box is a cell which is either missing from the liberty file or has no functionality defined in the liberty file.

## Related Commands

- `report_power`

## power\_report\_clock\_instance\_switching\_info

```
power_report_clock_instance_switching_info
```

*Default:* None

*Data\_type:* String

Specifies to generate a report for clock instances that switched during the state-propagation based

vectorless flow. The generated report contains the toggle time, instance name, input pin event, and output pin event for each switching event of the clock instance.

## Related Commands

- `report_power`

## power\_report\_idle\_instances

```
power_report_idle_instances {true | false}
```

*Default:* `false`

*Data\_type:* Boolean

Specifies to generate a report (`idleinstance.rpt`) that lists all the idle or non-switching instances.

The following is a snippet of the `idleinstance.rpt` report:

```
DFF22/DFF F
DFF42/DFF F
...
```

Here, the first column is the instance name and the second column is the type of instance (`F` indicates flop and `c` indicates combinational).

## Related Commands

- `report_power`

## power\_report\_instance\_switching\_info

```
power_report_instance_switching_info {all | output_logic | none}
```

*Default:* `none`

*Data\_type:* Enum

Specifies to generate a report for combinational instance switched during state-propagation. In the output file, it contains the toggle time, instance name, input pin event, and output pin event for each switching event of the combination gate. The possible arguments of this attribute are:

- `all` - Specifies to report instance toggle information for both input and output pins. When this attribute is set to `all`, the switching of both the input and output pins of all the instances are reported in the `voltus_power.stateprop.switchinst` file and the switching of flops are reported in the `voltus_power.stateprop.switchsrc` file.

- `output_logic` - Specifies to report instance toggle information for the output pins only. When this attribute is set to `output_logic`, the switching of the output pins of all the instances are reported in the `voltus_power.stateprop.switchinst` file and the switching of flops are reported in the `voltus_power.stateprop.switchsrc` file.
- `none` - Disables generation of instance toggle report. This is the default option. When this attribute is set to `none`, only switching of flops are reported in the `voltus_power.stateprop.switchsrc` file. The file does not report switching of instances.

This attribute is used for generating switching details of state-propagation and should be specified only for debugging purpose.

The following is a snippet of the `voltus_power.stateprop.switchinst` report:

```
*-----
*Switch Time Instance Name Pin Name Logic
*-----
*
0.097 B11/BUFF I rise
0.097 DFF11/DFF Q rise
...
```

Here,

- `Switch Time`: switching time of instances that can be either combinational or sequential
- `Instance Name`: instance name
- `Pin Name`: input/output pin of the instance
- `Logic`: present logic of the pin that can be either "rise" or "fall"

## Related Commands

- `report_power`

## power\_report\_instance\_switching\_list

`power_report_instance_switching_list filename`

*Default:* " "

*Data\_type:* String

Specifies to generate a report (`voltus_power.stateprop.switchlist`) containing all the switching times for the specified instances when the `power_enable_state_propagation` attribute is set to `true`.

The format of the specified file is:

```
instname1
instname2
...
```

The following command is an example of the state-propagation-based dynamic vectorless flow, and also specifies to generate a report (`voltus_power.stateprop.switchlist`) containing all the switching times for the instances specified in the `inst_list` file:

```
set_db power_method dynamic_vectorless power_enable_state_propagation true
power_report_instance_switching_list inst_list
```

The following is the format of the `voltus_power.stateprop.switchlist` report:

```
*-----
*Instance Name Pin Name Pin Direction Frequency Switch Time
*-----
*
```

Here,

- **Instance Name:** instance name that can be either combinational or sequential
- **Pin Name:** name of the input/output pin of the instance
- **Pin Direction:** indicates whether the pin is an INPUT (I) or OUTPUT (O) pin
- **Frequency:** clock frequency
- **Switch Time:** gives the switching pattern for the instance, that is, *<time1> <logic> <time2> <logic>*. The logic of the pin can be "r" or "f". r indicates rise and f indicates fall.

The following is a snippet of the `voltus_power.stateprop.switchlist` report:

```
*-----
*Instance Name Pin Name Pin Direction Frequency Switch Time
*-----
*
 DFF11/DFE QN O 100 0.106 f 10.107 r
 DFF11/DFE Q O 100 0.097 r 10.099 f
 DFF11/DFE CP I 100 0.059 r 5.056 f 10.059 r 15.056 ...
...
```

## Related Commands

- [report\\_power](#)

## power\_report\_missing\_nets

```
power_report_missing_nets {true | false}
```

*Default:* false

*Data\_type:* Boolean

Controls reporting of missing nets in both static and dynamic power analysis.

This attribute controls reporting for TWF and activity files in static analysis, and controls reporting for TWF/SDC/SPEF and activity files in dynamic analysis.

### Related Commands

- [report\\_power](#)

## power\_report\_scan\_chain\_statistics

```
power_report_scan_chain_statistics {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to generate a report file called `voltus_power.scanchain.stat` during scan mode analysis that contains scan chain statistics.

The report has 2 parts:

- **Global Statistics:** this section has the cumulative statistics of all scan chains in the design
- **Chain Statistics:** this section has the statistics for each scan chain in the design

The Global and Chain Statistics sections have the following information:

- **Total:** total instances specified in the control file or in a scan chain
- **AssignedFF:** flip-flops defined in the scan control file which exist in the design
- **SwitchedFF:** flip-flops that have switching event at the output
- **Non-ScanFF:** flip-flops that have no scan-out pin
- **DuplicatedFF:** flip-flops that are specified in multiple chains
- **StateConflictFF:** flip-flops that have conflicting state assignment

### Related Commands

- [report\\_power](#)

## power\_report\_statistics

```
power_report_statistics {true | false}
```

*Default:* false

*Data\_type:* Boolean

Reports a set of statistics on the instance power, instance power density, clock power, or transition density. This attribute is useful in viewing and debugging user defined activity factors.

### Related Commands

- [report\\_power](#)

## power\_report\_time\_display\_fraction\_digits

```
power_report_time_display_fraction_digits value
```

*Default:* -1

*Data\_type:* Integer

Sets the number of fractional digits or decimal places displayed for the instance switching time values in the `voltus_power.stateprop.switchinst` file. This attribute displays fractional digits that show the exact time difference if there are two events (rise/fall) of an instance switching at the same time.

### Related Commands

- [report\\_power](#)

## power\_report\_twf\_attributes

```
power_report_twf_attributes {summary| detailed}
```

*Default:* ""

*Data\_type:* String

Controls the generation of the TWF attribute report based on the TWF attributes that are specified using the `set_twf_attribute` command.

The possible arguments are:

- `summary` - generates a summarized static timing analysis report  
“`voltus_power.twf_attribute.summary`” that displays the number of user-defined TWF attributes (delay, slew, and slack values for both the rise and fall transitions) and the number of annotated

TWF attributes for dynamic power analysis. The following is a snippet of the report:

| STATISTICS:        |              |           |                    |
|--------------------|--------------|-----------|--------------------|
|                    | User Defined | Annotated | Annotated/Total(%) |
| shift_arrival_time | 5            | 4         | 80                 |
| rise_slew          | 2            | 2         | 100                |
| fall_slew          | 2            | 2         | 100                |
| rise_delay         | 5            | 4         | 80                 |
| fall_delay         | 5            | 4         | 80                 |
| rise_slack         | 2            | 2         | 100                |
| fall_slack         | 2            | 2         | 100                |

- **detailed** - generates a detailed static timing analysis report “`voltus_power.twf_attribute.detailed`” that includes the summary report, and a detailed report of the rise and fall transitions for the TWF attributes of each annotated instance/pin. It also includes the shift arrival time report.

This argument also allows you to generate a report `voltus_power.twf.rpt` containing the TWF statistics to highlight clock-frequency and delay used for the static and dynamic power calculation.

The TWF statistics report is generated only if:

- the `read_twf` command is specified before specifying the `power` category attributes.
- the `power_method static power_static_netlist def` or `power_method dynamic_vectorless | dynamic_vectorbased` command is specified.

The format of the `voltus_power.twf.rpt` report is:

```
Voltus TWF Statistics
Units: Freq (Hz), Delay (second), Slew (second)
TWF File List:
TWF_file1
TWF_fileN

USER DEFINED TWF ATTRIBUTE STATISTICS
<Clock Freq> <Min Rise_Delay> <Rise Delay> <Max Rise Delay> <Min Fall Delay> <Fall
Delay> <Max Fall Delay> <Net>
```

The `USER DEFINED TWF ATTRIBUTE STATISTICS` section is included in the report only if the TWF attributes are defined using the `set_twf_attribute` command.

### **Example :**

**#check all instances of inst\_C1 get shifted by 3ns**

```
set_twf_attribute -pin inst_C1 -shift_arrival_time 3
```

**#check all instances of inst\_D1 get shifted by 3ns**

```
set_twf_attribute -net inst_D1 -shift_arrival_time 3
```

```
set_db power_method dynamic_vectorless ; set_db power_write_db false ; set_db
power_disable_static false ; set_db power_enable_state_propagation true; set_db
```

```
power_current_generation_method peak ; set_db power_grid_libraries ../../library_pv.cl ; set_db
power_report_twf_attributes summary
```

## Related Commands

- [report\\_power](#)

## power\_reuse\_flop\_ranking\_data

```
power_reuse_flop_ranking_data directoryname
```

*Default:* ""

*Data\_type:* String

Specifies the name of the directory where the flop ranking data to be reused is placed.

## Related Commands

- [report\\_power](#)

## power\_reuse\_flop\_ranking\_data\_hier

```
power_reuse_flop_ranking_data_hier blockname
```

*Default:* ""

*Data\_type:* String

Allows you to choose the block/hierarchy whose ranking data is to be used for the block-level analysis. This attribute is used when there are multiple instantiations of the same DEF block.

## Related Commands

- [report\\_power](#)

## power\_scale\_to\_sdc\_clock\_frequency

```
power_scale_to_sdc_clock_frequency {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to enable the VCD clock frequency to be scaled up to the SDC clock frequency. This allows

you to match the VCD clock to the SDC clock to run analysis. By default, the clock frequency is scaled based on the activity file. When you set the `power_scale_to_sdc_clock_frequency` attribute to `true`, the power report and current waveforms apply the after-scaled clock frequency.

The default behavior for clock frequency scaling in the RTL and Gate level VCD flows is different, as described below:

- **RTL VCD** - By default, the clock frequency is scaled to the SDC clock frequency (`power_scale_to_sdc_clock_frequency true`) when the RTL VCD flow is enabled (`power_enable_rtl_dynamic_vector_based true`).  
You can disable clock frequency scaling by setting the `power_scale_to_sdc_clock_frequency` attribute to `false`.
- **Gate VCD** - By default, scaling of the clock frequency is disabled (`power_scale_to_sdc_clock_frequency false`).  
You can enable the VCD clock frequency to be scaled up to the SDC clock frequency by setting the `power_scale_to_sdc_clock_frequency` attribute to `true`. This works only when `power_use_zero_delay_vector_file` is set to `true`, which means that the gate VCD is a zero-delay gate VCD.

## Related Commands

- `report_power`

## power\_scan\_chain\_activity

```
power_scan_chain_activity {design_name chain_name activity_number} |
{vectorless activity_number}
```

*Default:* ""

*Data\_type:* String

Specifies to either provide vectorless activity for all scan chains or provide a specific activity for a specific chain. This attribute allows you to specify vectorless or user-defined activity to scan chains.

The following are the two use models:

- Generate the scan control file for a specific chain:  
`set_db power_scan_chain_activity {design_name chain_name activity_number}`
- Generate the scan control file for all scan chains:  
`set_db power_scan_chain_activity {vectorless activity_number}`

The `power_scan_chain_activity` attribute is supported only in the XP mode.

## Related Commands

- [report\\_power](#)

## power\_scan\_chain\_name\_pattern

`power_scan_chain_name_pattern {design_name chain_name pattern}`

*Default:* ""

*Data\_type:* String

Specifies to automatically generate a scan-chain control file from a scan-chain based DEF file for the shift mode scan-chain analysis. This attribute allows you to create a control file for a large-sized DEF containing long chains or for multiple-DEF files. The generated scan-chain control file is saved in the power output directory.

The use model of the attribute is:

- `power_scan_chain_name_pattern {all pattern}` - generate scan control file for all scan chains.

**Example:** `power_scan_chain_name_pattern {all 11010}`

- `power_scan_chain_name_pattern {design_name chain_name pattern}` - generate scan control file for a specific chain.

**Example:** `power_scan_chain_name_pattern {counter AutoChain_1_seg1_clk_rising 10010}`

Using this attribute, you can generate the control file for both flat and hierarchical DEFs. For more information, refer to [Scan Control File Format](#).

## Related Commands

- [report\\_power](#)

## power\_scan\_control\_file

`power_scan_control_file filename`

*Default:* ""

*Data\_type:* String

Specifies the scan control file name required to run the Scan Mode Analysis flow.

The scan control file contains details about the scan analysis mode used for testing. For more information, refer to [Scan Control File Format](#).

## Related Commands

- [report\\_power](#)

## power\_set\_power\_event\_based

```
power_set_power_event_based {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies the instance-based power constraints that are to be taken into consideration for the power analysis flow. The attribute controls whether the power constraints are applied to the dynamic or static flow. The power constraints are specified using the `set_power` command.

The default value of `false` specifies to apply the power constraints in the static flow. When set to `true`, the constraints are applied to the dynamic flow.

### Example:

The following command specifies to honor the instance-based power constraints in the dynamic power analysis flow:

```
set_db power_method event_based power_set_power_event_based true
set_power -ascii_power_file instPower.txt
report_power -out_file power.rpt
```

## Related Commands

- [report\\_power](#)

## power\_settling\_buffer

```
power_settling_buffer value
```

*Default:* " "

*Data\_type:* String

Specifies the settling buffer time (in ps unit) between multiple windows of a VCD file. This attribute is used when you specify multiple pairs of the start time and end time for the non-overlapping multiple windows specified in an activity file (using the `read_activity_file` command).

Multiple current waveforms representing multiple VCD windows are merged into a single continuous current waveform. To capture the waveform for signals at the edge of user windows, a buffer time is added between the windows being stitched. This buffer time ensures that the stitched waveform is contiguous. The generated waveform hence has the duration of user windows and the intervening settling buffers. The default settling buffer period is 400ps.

You must specify the buffer value without unit.

## Related Commands

- `report_power`

## power\_show\_cell\_usage\_stats

```
power_show_cell_usage_stats {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to show the cell usage statistics in the power report. It provides cell usage statistics alongside power values, indicating the number of cells used from a specific library and the corresponding power percentage. This helps identify libraries with the greatest and least impact on power consumption.

You must ensure that this attribute is specified before using the `report_power` command, as shown below:

```
set_db power_show_cell_usage_stats true
report_power -out_file pl.rpt
```

Following is a snippet from the report:

```
Total leakage power = 0.00118471 mW
Cell usage statistics:
Library jlos_h , 88 cells (7.351713%) , 6.56434e-06 mW (0.554089%)
Library jlos_l , 123 cells (10.275689%) , 0.000799809 mW (67.511081%)
Library jlos , 986 cells (82.372597%) , 0.000378334 mW (31.934830%)
```

## Related Commands

- `report_power`

## power\_smart\_window

```
power_smart_window {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to enable the smart window feature to extract peak power scenarios from a vector-based activity file. A smart window is a variable size window to capture maximum regions of high power dissipation. An activity file can have multiple variable-sized regions that are ranked in the descending order of power metric.

The use model of the `power_smart_window` attribute is:

```
set_db power_smart_window true
set_db power_worst_step_size value
set_db power_worst_window_type [power | activity | delta_power | delta_activity | ir |
critical_inst_power]
```

## Related Commands

- `report_power`

## power\_scan\_multi\_bit\_flop\_chain\_type

```
power_scan_multi_bit_flop_chain_type type
```

*Default:* liberty

*Data\_type:* String

Specifies the type of multi-bit scan flip-flop.

- `liberty` - specifies to use the syntax in Liberty to decide the multi-bit flip-flop type.
- `serial` - specifies to pick the first flop as the starting flop, and treat the scan chain as serial, regardless of .lib.
- `parallel` - specifies to treat the scan chain as parallel, regardless of .lib.

## Related Commands

- `report_power`

## power\_split\_bus\_power

```
power_split_bus_power {true | false}
```

*Default:* false

*Data\_type:* Boolean

A value of `false` applies the internal power number to each individual bit.

A value of `true` divides the internal power number by bus width, before applying it to the bus bit.

### Related Commands

- `report_power`

## power\_start\_time\_alignment

```
power_start_time_alignment {true | false}
```

*Default:* true

*Data\_type:* Boolean

Specifies to align all the signals of the activity file at time zero. When set to `true`, the simulation period is `max(endtime - starttime)`. When it is `false`, the simulation period is `max(endtime) - min(starttime)`.

**Note:** This attribute is not supported in the vector profiling flow. In the vector profiling flow, the start time will always be the `min(starttime)` and the end time will always be `max(endtime)`

### Related Commands

- `report_power`

## power\_state\_dependent\_leakage

```
power_state_dependent_leakage {true | false}
```

*Default:* true

*Data\_type:* Boolean

When set to `false`, power analysis performs state independent leakage power calculation.

### Related Commands

- `report_power`

## power\_stateprop\_ignore\_unannot\_pins

```
power_stateprop_ignore_unannot_pins {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to ignore unannotated pins in the functional logic of output pins for the RTL propagation flow. This attribute is set to `true` if there are unannotated input pins for instances and such pins are used in the functional logic of output pins that are propagated. For example output pin Q is propagated with functional logic A & B where A is unannotated and might cause wrong propagation for the Q pin.

### Related Commands

- `report_power`

## power\_static\_multi\_mode\_scenario\_file

```
power_static_multi_mode_scenario_file filename
```

*Default:* ""

*Data\_type:* String

Specifies a file with information on instance scaling scenario for the static multi-mode IR analysis flow. When this parameter is specified, Power Analysis creates the multi-mode static current file that is used during rail analysis. The format of the input file is:

| INST_NAME | PIN_NAME | SCALE_FACTOR_1 | .... | SCALE_FACTOR_N |
|-----------|----------|----------------|------|----------------|
|-----------|----------|----------------|------|----------------|

Here, the first column indicates the macro instance name, the second column indicates the pin name, followed by multiple current scaling factors. Each column of the scaling factor is referred to as a scenario. You must specify positive values only for scale factors.

The following is a snippet from the specified input file:

|            |      |     |     |     |     |
|------------|------|-----|-----|-----|-----|
| top/macroA | VDD  | 1   | 0.5 | 0.5 | 1   |
| top/macroA | VDDM | 0.5 | 0.5 | 0.5 | 1   |
| top/macroB | VDD  | 0.5 | 1   | 0.5 | 0.5 |

If scale factors are not specified for certain scenarios, the tool will automatically use the instance's last stored scale factor value to complete current file generation.

In the following example, scale factor value `0.45` will be used in the 3rd and 4th scenario for instanceC, and scale factor value `0.35` will be used in the 4th scenario for instanceD:

```
instanceA VDD 0.45 0.55 0.65 0.31
instanceB VDD 0.31 0.5 0.67 0.21
instanceC VDD 0.25 0.45
instanceD VDD 0.31 0.25 0.35
```

## Related Commands

- `report_power`

## power\_static\_netlist

```
power_static_netlist {verilog | def}
```

*Default:* verilog

*Data\_type:* String

Specifies to perform static power analysis using a Verilog or DEF only netlist.

By default, the static power analysis is performed using the Verilog netlist as the primary netlist. Using this attribute, you can specify DEF when a DEF netlist with logical connectivity is available, and use it as primary and not consider the Verilog netlist.

This attribute is also enabled when `set_rail_analysis_config -report_power_in_parallel` is true for static power computation.

## Related Commands

- `report_power`

## power\_switching\_power\_on\_rise\_only

```
power_switching_power_on_rise_only {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to perform switching power analysis only for rise toggles.

## Related Commands

- `report_power`

## power\_thermal\_input\_file

```
power_thermal_input_file file
```

*Default:* ""

*Data\_type:* String

Specifies to read a power map file to perform thermal analysis. Thermal input file contains die area divided into tiles, and temperature value for each tile. This temperature of each tile is used to calculate power of all the instances that fall in that tile's bounding box.

The format of the thermal input file is:

```
DIE_TEMPERATURE_MAP
DIE_AREA xmin(um) ymin(um) xmax(um) ymax(um) nx(int) ny(int)

NUMBER_OF_LAYERS nLayers(int)
LAYER layer_name(string)
TEMPERATURE

XCOOR x0(0) x0(1) x0(2)x0(nx-1)
YCOOR y0(0) y0(1) y0(2)y0(ny-1)

T0(0,0) T0(1,0) ... T0(nx-1,0)
T0(0,1) T0(1,1) ... T0(nx-1,1)

:
T0(0,ny-1) T0(1,ny-1) ... T0(nx-1,ny-1)
END_TEMPERATURE
END_LAYER
END_DIE_TEMPERATURE_MAP
```

where,

- **DIE\_AREA** specifies the coordinates of the four points of die outline as well as the tile number in X and Y direction.
- **NUMBER\_OF\_LAYERS** is the number of layers in each die instance
- **LAYER** specifies the LEF layer name
- **XCOOR** and **YCOOR** are the coordinates of each tile
- **T0(0,0) ....** is the temperature value assigned to a tile at a specific coordinate

## Related Commands

- [report\\_power](#)

## power\_thermal\_leakage\_temperature\_scale\_table\_file

power\_thermal\_leakage\_temperature\_scale\_table\_file *file*

*Default:* ""

*Data\_type:* String

Specifies a file containing the user-defined temperature values and temperature scale factors for each

instance. This attribute allows you to use the current file (.ptiavg) with re-adjusted leakage power values to perform thermal-aware IR drop analysis.

The `power_thermal_leakage_temperature_scale_table_file` attribute must be specified with the `power_thermal_input_file` attribute to import the temperature map file generated by Celsius.

When the new attribute is specified, the generated power will include the scaled leakage power values.

The following is the format of the temperature-aware leakage scaling table:

```
#Type Instance_Name temp1 temp2 temp3 temp4
(Type: Lib/Cell/inst)

inst inst_name1 scalefactor@temp1 scalefactor@temp2 scalefactor@temp3
scalefactor@temp4
inst inst_name2 scalefactor@temp1 scalefactor@temp2 scalefactor@temp3
scalefactor@temp4
```

### **File Format Example:**

```
#Type Name 25 50 125 150
inst ring/b213 1 2 5 10
inst ring/b212 1 2 5 10
inst ring/b211 1 2 5 10
inst ring/b210 1 2 5 10
```

## **Related Commands**

- `report_power`

## **power\_to\_x\_transition\_factor**

`power_to_x_transition_factor value`

*Default:* 0.5

*Data\_type:* Double

Specifies how 0/1 to X transitions are counted.

## **Related Commands**

- `set_power`

## **power\_to\_z\_transition\_factor**

`power_to_z_transition_factor value`

*Default:* 0.25

*Data\_type:* Double

Specifies how 0/1 to Z transitions are counted.

## Related Commands

- [set\\_power](#)

## power\_transition\_factor\_based\_duty

```
power_transition_factor_based_duty {true | false}
```

*Default:* false

*Data\_type:* Double

Specifies that duty for X and Z toggles is calculated using the X and Z transition factor of toggle specified using the following attributes:

- `power_from_x_transition_factor`
- `power_from_z_transition_factor`
- `power_to_x_transition_factor`
- `power_to_z_transition_factor`

The default value of `false` specifies to use the duty value given with the `set_default_switching_activity/set_switching_activity -duty` parameter.

## Related Commands

- [report\\_power](#)

## power\_transition\_time\_method

```
power_transition_time_method {min | avg | max}
```

*Default:* max

*Data\_type:* String

Specifies the minimum, maximum, or average transition time method that will be used with the integrated timer or the external TWF.

## Related Commands

- [report\\_power](#)

## power\_twf\_delay\_annotation

```
power_twf_delay_annotation {min | avg | max}
```

*Default:* avg

*Data\_type:* String

Allows you to choose between min, max, or avg arrival times from the timing window file (TWF). The arrival time is annotated to the vectors processed from the RTL VCD/FSDB Zero-Delay flows.

## Related Commands

- [report\\_power](#)

## power\_twf\_load\_cap

```
power_twf_load_cap {min | avg | max}
```

*Default:* max

*Data\_type:* String

Allows you to select minimum, maximum, or average value of TWF external load or capacitance for power calculation.

## Related Commands

- [report\\_power](#)

## power\_unified\_power\_switch\_flow

```
power_unified_power_switch_flow {true | false}
```

*Default:* true

*Data\_type:* Boolean

Specifies to enable the unified analysis of the always-on and switch nets. When set to `true`, the power-up and always-on analyses are performed in a single flow, wherein the switch nets and always-on nets are simulated together resulting in improved performance and accuracy.

## Related Commands

- `report_power`

## power\_use\_cell\_leakage\_power\_density

```
power_use_cell_leakage_power_density {true | false}
```

*Default:* true

*Data\_type:* Boolean

Specifies to use library leakage density times area (`default_leakage_power_density`), if defined, instead of the library's default cell leakage power (`default_cell_leakage_power`). This is used when leakage power for cells are missing or not defined.

## Related Commands

- `report_power`

## power\_use\_fastest\_clock\_for\_dynamic\_scheduling

```
power_use_fastest_clock_for_dynamic_scheduling {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to use only the respective fastest clock associated with each net or pin to schedule events for a given simulation period.

## Related Commands

- `report_power`

## power\_use\_lef\_for\_missing\_cells

```
power_use_lef_for_missing_cells {true | false}
```

*Default:* false

*Data\_type:* Boolean

Allows a combination of LEF and PGV in the dynamic analysis flow. If there are cells that are common to LEF and PGV, the PGV cell will get the precedence.

## Related Commands

- [report\\_power](#)

## power\_use\_only\_ddv\_current

```
power_use_only_ddv_current {true | false}
```

*Default:* true

*Data\_type:* Boolean

Controls the use of static current of a detailed dynamic power-grid view (DDV PGV) cell for static power calculation. The parameter is set to `true` by default, that is, the DDV PGV static current is not used in the static power calculation flow. If you want to use the DDV PGV static current for static power calculation, set this parameter to `false`.

## Related Commands

- [report\\_power](#)

## power\_worst\_case\_vector\_activity

```
power_worst_case_vector_activity {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to use the worst activity value when multiple vectors are specified in the static power calculation flow.

## Related Commands

- [report\\_power](#)

## power\_worst\_step\_size

```
power_worst_step_size value
```

*Default:* ""

*Data\_type:* String

Specifies the step size or resolution for vector profiling. Activity/ Power profiling is carried out for every step size that you specify.

When this attribute is used with `power_worst_window_size`, the specified step size is the resolution at which window sliding is performed. The supported time units are s, ms, us, ns, and ps. If no explicit time unit is specified, the default ns will be applied.

## Related Commands

- `report_power`

## power\_worst\_window\_count

`power_worst_window_count value`

*Default:* 1

*Data\_type:* String

Specifies the number of worst windows from the last vector profile run to be used for dynamic power analysis. By default, the software implements a single worst window. This attribute provides n top windows with maximum activity/power/IR. This attribute is used when you need to combine dynamic power analysis and vector profiling for multiple worst-case windows in a single run.

## Related Commands

- `report_power`

## power\_worst\_window\_size

`power_worst_window_size value`

*Default:* ""

*Data\_type:* String

Specifies the duration of dynamic analysis. This attribute is used for sliding window vector profiling that involves sliding the profiling windows by using a very small resolution value to get the window with the worst current profile. `power_worst_window_size` must be specified with `power_worst_step_size`.

The supported time units are s, ms, us, ns, and ps. If no explicit time unit is specified, the default ns will be applied.

## Related Commands

- `report_power`

## power\_worst\_window\_type

```
power_worst_window_type {power | activity | delta_power | delta_activity | ir |
critical_inst_power}
```

*Default:* ""

*Data\_type:* String

Specifies the window type to be used for multi-window analysis. The possible arguments are:

- `power` - worst instance power
- `activity` - worst instance activity
- `delta_power` - worst dp/dt (rate of change of power)
- `delta_activity` - worst da/dt (rate of change of activity)
- `ir` - worst IR
- `critical_inst_power` - worst power for critical/IR-sensitive instance (worst timing and IR)

## Related Commands

- `report_power`

## power\_worst\_window\_coverage

```
power_worst_window_coverage { top | tile }
```

*Default:* ""

*Data\_type:* String

Specifies how the worst window type is applied for multi-window analysis in the vector profiling flow. The following are the possible options of this attribute:

- `top`: worst window selection for the full design
- `tile`: interval selection as per the worst tile power

## Use Model:

```
set_db power_method event_based power_worst_window_coverage tile
report_power -out_file power.rpt -power_density_tiles 100
```

This flow should be run with `power_method event_based`.

When the `power_worst_window_coverage tile` attribute is specified, you should include any one of the following parameters to specify the total number of tiles:

- `report_power -power_density_tiles_size " 15 15 "`

- `report_power -power_density_tiles_row_column " 2 2 "`
- `report_power -power_density_tiles 100`

The software generates the `power.rpt.density` report that has the power density tiles profile report with an additional section "Intervals covering unique tiles having worst power density".

## Related Commands

- `report_power`

## power\_worst\_window\_reports

```
power_worst_window_reports {full | worst | both}
```

*Default:* full

*Data\_type:* String

Specifies to generate static power analysis reports for the specified worst window type. The possible arguments are:

- `full`: creates the static power report for the full simulation window specified with the `-start/-end` parameters of the `read_activity_file` command.
- `worst`: creates the static power report for the worst window only.
- `both`: creates the static power report for both the full simulation and worst windows.

The worst window report is created with `‘.1’` added in the file name, as shown below:

- Static reports for full simulation: `power.rpt.avgpwr`, `power.rpt.instpwr`
- Static reports for worst window: `power.rpt.1.avgpwr`, `power.rpt.1.instpwr`

## Related Commands

- `report_power`

## power\_write\_dynamic\_currents

```
power_write_dynamic_currents {true | false}
```

*Default:* false

*Data\_type:* Boolean

Specifies to create dynamic current files either for full simulation duration or for user-specified duration.

This attribute is only applicable to the event-based power analysis flow (`power_method event_based`).

**Example:**

```
set_db power_method event_based power_write_dynamic_currents true
power_enable_state_propagation true
read_activity_file sim.vcd -format vcd
report_power -out_file power.rpt
```

**Related Commands**

- `report_power`

**power\_use\_physical\_partition**

```
power_use_physical_partition {true | false}
```

*Default:* false

*Data\_type:* Boolean

Enables tile or area-based partitioning of a design for distributed processing. When this attribute is specified, the top-level design is divided into physical tiles, which are then grouped to ensure that each group or partition has the same instance count. Each partition is considered and processed as a separate job.

This attribute is only applicable to the event-based power analysis flow (`power_method event_based`) in the XP mode. The `power_use_physical_partition` attribute must be specified with the `power_partition_count` attribute.

**Example:**

The following command specifies to enable area-based partitioning, and distribute the event-based analysis into four jobs:

```
set_db power_method event_based power_enable_xp true power_use_physical_partition true
power_partition_count 4
report_power -distribute
```

**Related Commands**

- `report_power`

**power\_use\_twf\_stable\_randomized\_arrival\_delay**

```
power_use_twf_stable_randomized_arrival_delay {none | data_only | all}
```

*Default:* none

*Data\_type*: String

Specifies to annotate randomized arrival time based on net names. The parameter ensures that when there is a change in design, the net delay is not impacted. This parameter is supported in both the static and dynamic flows.

The possible arguments are:

- `none` - disables randomized timing window annotation.
- `all` - performs randomized annotation for both the clock and data nets.
- `data_only` - performs randomized annotation only for the data nets.

## Related Commands

- `report_power`

## power\_use\_zero\_delay\_vector\_file

```
power_use_zero_delay_vector_file {true | false}
```

*Default*: `false`

*Data\_type*: Boolean

Enables zero delay mode in vector-based dynamic analysis to avoid pessimism in current estimation. When set to `true`, the software reads the cycle accurate (zero delay) VCD/FSDB file and adds the timing/delay information from the Timing Analyzer or external TWF file to the VCD/FSDB file.

## Related Commands

- `report_power`

## power\_vector\_based\_multithread

```
power_vector_based_multithread {true | false}
```

*Default*: `true`

*Data\_type*: Boolean

Specifies to enable multi-threading for the VCD/FSDB based dynamic vector-based flows.

To enable multi-threading in the vector-based flows, set this attribute to `true`.

## Related Commands

- [report\\_power](#)

## power\_vector\_profile\_mode

`power_vector_profile_mode {activity | event_based | power_density | transient}`

*Default:* `event_based`

*Data\_type:* Enum

Specifies the method used to perform vector profiling. The possible arguments are:

- `activity` - performs activity profiling. This parameter generates only the worst activity report, and does not generate the average power report. The name of the file is as specified using the `report_power -out_file` parameter.
- `event_based` - generates the average power report. This is the average power of all events in the user-specified window. This report includes a summary based on the power components, cell type, power rail, and clock network. The worst window report is captured in a file specified with the `report_power -out_file` parameter, and the report is suffixed by ``.avgpower'`. When `-out_file` is not specified, the `vectorprofile.report.avgpower` report file is created.
- `power_density` - performs area or power density profiling. For this method, power is reported for each tile of the design, where design can be considered to be physically divided into equal area tiles. By default, a design is divided in 10x10 tiles.
- `transient` - generates the event-based average power report and current files for the worst power window.

## Related Commands

- [report\\_power](#)

## power\_write\_gui\_db

`power_write_gui_db {true | false}`

*Default:* `true`

*Data\_type:* Boolean

Specifies to create a binary database of power results in the XP mode. When set to `true`, the tool creates sliced power database file for each rail partition and saves it to the `gui.db` sub-directory under the power output directory (example: `power_dir/part_*/gui.db/rail_part_*/power.x.db` (`x = 1, 2, ..., 14`)). The

generated power database allows you to perform GUI interactive debugging using the *Power & Rail Plots* and *Power Debug* forms.

## Related Commands

- `report_power`

## power\_write\_bbox

```
power_write_bbox {true | false}
```

*Default:* `false`

*Data\_type:* Boolean

Specifies to save the boundary box of each instance, its placement, and rotation at the top level. When set to `true`, generates the power database with each instance boundary box, placement, and rotation information at the top level.

## Related Commands

- `report_power`

## power\_write\_db

```
power_write_db {true | false}
```

*Default:* `false`

*Data\_type:* Boolean

A value of `true` creates a binary database of power results.

## Related Commands

- `report_power`

## power\_write\_default\_pti\_files

```
power_write_default_pti_files {true | false}
```

*Default:* `true`

*Data\_type:* Boolean

For instances that are not hooked to any power/ground rail, the current for these instances are reflected in the default static current files:

- `static_default_ground_rail.ptiavg`
- `static_default_power_rail.ptiavg`

## Related Commands

- `report_power`

## power\_write\_profiling\_db

```
power_write_profiling_db {true | false}
```

*Default:* `false`

*Data\_type:* Boolean

Writes out profiling databases which can later be viewed as histograms using the SimVision interface. You can specify this parameter during both the activity and power vector profiling. The profiling databases support instance level and power/ground net histograms. It creates an output file name with the `*.trn` extension.

## Related Commands

- `report_power`

## power\_write\_simulation\_db

```
power_write_simulation_db {true | false}
```

*Default:* `false`

*Data\_type:* Boolean

Specifies to save functional waveforms for each instance when parsing an activity file. When set to `true`, creates SimVision waveform database (SHM database) for toggle simulation used during power analysis, which can later be viewed as histograms using the SimVision interface.

The simulation database (`shmdb.trn`) is generated in the power analysis output directory.

## Related Commands

- `report_power`

## power\_write\_static\_currents

```
power_write_static_currents {true | false}
```

*Default:* false

*Data\_type:* Boolean

A value of `true` generates the current data files per net.

**Note:** When you perform static power calculation in the dynamic power analysis flow, you can use either the `power_disable_static` or `power_write_static_currents` attribute to enable static power calculation and write static current file. If only `power_disable_static` is set to false and `power_write_static_currents` is not set, the tool automatically sets `power_write_static_currents` to true. Similarly, if `power_write_static_currents` is set to true, and `power_disable_static` is not set, the tool automatically sets `power_disable_static` to false.

## Related Commands

- `report_power`

## power\_x\_transition\_factor

```
power_x_transition_factor value
```

*Default:* 0.5

*Data\_type:* Double

When using VCD/FSDB, one can specify how transitions to and from X are counted. These transitions are defined as shown in [Table 1](#) below. Transitions to and from the X state will be treated as full transitions multiplied by the specified factor.

**Note:** 0 -> X -> 1 or 1 -> X -> 0 count as full transitions and they are not controlled by the attribute.

## Related Commands

- `report_power`

## power\_x\_count\_transition\_using\_3\_states

`power_x_count_transition_using_3_states {true | false}`

*Default:* false

*Data\_type:* Boolean

Specifies to calculate the toggle rate using 3 states, pre-previous, previous and current states.

### Related Commands

- `report_power`

## power\_z\_transition\_factor

`power_z_transition_factor value`

*Default:* 0.25

*Data\_type:* Double

When using VCD/FSDB, one can specify how transitions to and from Z are counted. These transitions are defined as shown in [Table 1](#) below. Transitions to and from the Z state will be treated as full transitions multiplied by the specified factor.

**Note:** 0 -> XZ-> 1 or 1 -> Z-> 0 count as full transitions and they are not controlled by the `attribute`.

### Related Commands

- `report_power`

**Table 1: Transitions from/to X and Z values and**

| Transition | Definition           | Default |
|------------|----------------------|---------|
| to/from X  | [ 0 or 1 or Z] <-> X | 0.5     |
| to/from Z  | [ 0 or 1 ] <-> Z     | 0.25    |

## power\_zero\_delay\_vector\_toggle\_shift

`power_zero_delay_vector_toggle_shift value`

*Default:* ""

*Data\_type:* String

Specifies to shift the current waveform in the zero-delay VCD flow. This attribute is useful in removing the idle period for the current waveform result with a long idle period (small flat current) before the first high current peak because of delay annotation. The attribute allows to offset the idle period from the delay values.

The default value is 0ns. The supported time units are s, ms, us, ns, and ps. The default unit is ns. You can specify a negative or a positive value. A positive value means right shift in the timeline or add more delay to the original arrival time, and a negative value means left shift in the timeline or trim the unwanted idle period.

The `power_zero_delay_vector_toggle_shift` attribute enables you to make a more realistic current waveform that can be easily aligned with the other current waveforms.

**Note:** This attribute is similar to the `set_twf_attribute -shift_arrival_time` parameter, with the only difference that `power_zero_delay_vector_toggle_shift` supports both positive and negative values while `-shift_arrival_time` supports only a positive value.

## Related Commands

- `report_power`

## Scan Control File Format

The use model for the Scan Mode Analysis flow is:

```
set_db power_method dynamic_vectorbased power_scan_control_file filename
```

The format of the scan control file is:

```
MODE = [SHIFT | VECTORLESS]
VECTORLESS_GLOBAL_ACTIVITY = <factor> [Between 0 - 1]
<chain_name> <flop_inst> <initial_state> <master_cell_name> <scale> <mode> <scan_in_pin>
<scan_out_pin> <scan_en_pin>
```

Note that `<chain_name>` is optional, `<initial_state>` is optional in vector-less mode, and `<master_cell_name>`, `<scale>`, `<mode>`, `<scan_in_pin>`, `<scan_out_pin>`, `<scan_en_pin>` are optional and only needed for the first internal scan flop inside one macro.

Where,

- `Mode` specifies the mode used for scan design analysis. The two modes are: `SHIFT` and `VECTORLESS`.
- `VECTORLESS_GLOBAL_ACTIVITY` specifies the activity specification used in the `VECTORLESS` mode.
- `chain_name` is the name of the scan chain.
- `initial_state` is the initial state of all scan flops.
- `master_cell_name` is the name of the macro.

- `scale` is the scaling factor applied to the current.
- `mode` is mode name of the scan mode in the PGV view.
- `scan_in_pin` is the macro's `scan_in` pin name.
- `scan_out_pin` is the macro's `scan_out` pin name.
- `scan_en_pin` is the macro's `scan_enable` pin name.

## propagate\_activity

```
propagate_activity
[-set_net_frequency {true | false}]
```

Propagates the activity file in the database after it is read in using the `read_activity_file` command. This command propagates the activity for all primary inputs, nets, and other devices in the design whose activity has not been previously defined through user attributes.

`propagate_activity` can be used to propagate activities in the design and check for activity annotation before running power calculation. This is not a mandatory step as execution of `report_power` will also do the same and then do power calculation based on the propagated activities.

### Parameters

```
-set_net_frequency {true | false}
```

Specifies that activity from the generated TCF file needs to be used to capture net frequency for signal EM analysis. When this parameter is set, you do not have to read the TCF file to set net frequency.

### Example

- The following commands read and propagate the activity file in the database:

```
read_activity_file
propagate_activity
```

## Related Topics

- "[Signal ElectroMigration](#)" in the *Voltus User Guide*

# query\_power\_data

```
query_power_data
[-help]
[<pti_files <file1[<file2> ...>>]
[-average_current]
[-clock_average]
[-write_pwl]
[-frame <string>]
[-insts <inst_list>]
[-inst_list_file <filename>]
[-list]
[-out_dir <string>]
[-peak_current]
[-peak_time]
[-pin]
[-time_steps]
[-verbose]
[-total_current <input_current_file>]
[-output_tap_name <tap_name>]
```

The `query_power_data` command allows you to query the binary current files (.ptiavg/.ptipeak) that Power Calculation/Rail Analysis creates. It reads the tap current data in the current files and reports various information for debugging.

## Parameters

|                                 |                                                                                 |
|---------------------------------|---------------------------------------------------------------------------------|
| - help                          | Outputs the command usage and a brief description about the command parameters. |
| <pti_files <file1[<file2> ...>> |                                                                                 |
|                                 | Specifies the names of the VDD and VSS instance voltage pti files.              |
| -average_current                |                                                                                 |
|                                 | Specifies to write the average current of all instances.                        |
| -clock_average                  |                                                                                 |

|                                                |                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                | Specifies to write the clock based current report.                                                                                                                                                                                                                                                                              |
| <code>-write_pwl</code>                        |                                                                                                                                                                                                                                                                                                                                 |
|                                                | Specifies to write the tap current in the PWL format. You can use this parameter to view the contents of the binary data file.                                                                                                                                                                                                  |
| <code>-frame &lt;string&gt;</code>             |                                                                                                                                                                                                                                                                                                                                 |
|                                                | Specifies intervals for the clock_average report.                                                                                                                                                                                                                                                                               |
| <code>-insts &lt;inst_list&gt;</code>          |                                                                                                                                                                                                                                                                                                                                 |
|                                                | Specify the list of instances to be dumped in the ASCII format, one instance per line. If not specified, it prints all instances.<br><br>The <code>-insts</code> parameter is specified with the <code>-write_pwl</code> , <code>-peak_current</code> , <code>-peak_time</code> , and <code>-average_current</code> parameters. |
| <code>-inst_list_file filename</code>          |                                                                                                                                                                                                                                                                                                                                 |
|                                                | Specifies a file with the list of instances to be dumped in the ASCII format.                                                                                                                                                                                                                                                   |
| <code>-list</code>                             |                                                                                                                                                                                                                                                                                                                                 |
|                                                | Specifies to write the tap names from the input file.                                                                                                                                                                                                                                                                           |
| <code>-out_dir &lt;string&gt;</code>           |                                                                                                                                                                                                                                                                                                                                 |
|                                                | Specifies the name of the output file.                                                                                                                                                                                                                                                                                          |
| <code>-output_tap_name &lt;tap_name&gt;</code> |                                                                                                                                                                                                                                                                                                                                 |
|                                                | Specifies the name of the output tap in the new current file, which is created using the <code>-total_current</code> parameter.                                                                                                                                                                                                 |
| <code>-peak_current</code>                     |                                                                                                                                                                                                                                                                                                                                 |
|                                                | Specifies to write the peak current of all instances.                                                                                                                                                                                                                                                                           |
| <code>-peak_time</code>                        |                                                                                                                                                                                                                                                                                                                                 |
|                                                | Specifies to write the peak current time of all instances.                                                                                                                                                                                                                                                                      |
| <code>-pin</code>                              |                                                                                                                                                                                                                                                                                                                                 |
|                                                | Specifies to print the pin names with the instance names. The <code>-pin</code> parameter is specified with the <code>-write_pwl</code> and <code>-list</code> parameters.                                                                                                                                                      |
| <code>-verbose</code>                          |                                                                                                                                                                                                                                                                                                                                 |

|                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                        | Specifies to print the report to standard output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>-time_steps</code>                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                                                        | Specifies to summarize the minimum current, maximum current, average current, and total current for each interval in the data file. You can use this data to estimate which interval in a transient response might contain the worst-case data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>-total_current &lt;input_current_file&gt;</code> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                                                        | <p>Specifies to create a new current (.ptiavg) file containing the total current for all taps of a net. This parameter can be used if you have a very large current file generated by the Power Calculation engine and want to see only a total current waveform in the SimVision waveform viewer.</p> <p><i>input_current_file</i> is the current file that will be read in (output from the Power Calculation engine).</p> <p>Use the following syntax to create a total current file:</p> <pre>query_power_data -total_current &lt;input_current_file&gt; -out_dir &lt;output_total_current_file&gt;</pre> <div> <p> <code>-out_dir</code> is used to specify a user-defined output current filename, and is not a mandatory parameter. If not specified, the output file will be generated automatically with the name of the input file suffixed with .ptiavg.</p> </div> |

## Example

- The following command creates a total current waveform file `VDD` from the input file `dynamic_VDD.ptiavg`:  

```
query_power_data -output_tap_name vdd_tap -total_current dynamic_VDD.ptiavg -out_dir VDD
```

# read\_activity\_file

```
read_activity_file activity_file
[-end { time1 time2 ...timen }]
[-format {vcd | tcf | saif | fsdb | phy | shm}]
[-hierarchy_separator separator]
[-reset]
[-start { time1 time2 ...timen }]
[-write_net_freq {true | false}]
[-block block_name]
[-scope scope_name]
[-scale_time scalefactor]
[-start_time_shift value]
[-rtl {true|false}]
[-name_mapping_rule file]
[-weight value]
[-zero_delay {true|false}]
[-cell cell_name]
```

Specifies the name and type of activity file to be used as input. This command must be used when specifying activity files for static or dynamic power calculation.

## Parameters

|                          |                                                                                                                                                                                                                                                                                                                             |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -block <i>block_name</i> |                                                                                                                                                                                                                                                                                                                             |
|                          | <p>Specifies the name of the FSDB/SAIF/TCF/VCD block to map a sub-block activity file with a top level Verilog file. Provides the ability to support multiple activity files based upon block instance names.</p> <p>The block argument is added to the FSDB/SAIF/TCF/VCD name before comparing it to the Verilog file.</p> |
| -cell <i>cell_name</i>   |                                                                                                                                                                                                                                                                                                                             |

Specifies the master cell name for the activity file. This parameter allows you to support master-cell-based activity specification. That is, you need to specify only the master cell name for the activity file, instead of specifying all the instances that were instantiated from a master cell.

### Example

Let us consider a design that has a cell named "super\_filter" with four block instances "super\_filter1", "super\_filter2", "super\_filter3", and "super\_filter4":

#### Instance-Based Use Model:

```
read_activity_file -format VCD -block super_filter1
read_activity_file -format VCD -block super_filter2
read_activity_file -format VCD -block super_filter3
read_activity_file -format VCD -block super_filter4
```

#### Master-Cell-Based Use Model:

```
read_activity_file -format VCD -cell super_filter
```

```
-end { time1 time2 ...timen }
```

When you use the vector-driven method of performing dynamic instance-based power-consumption calculation, you can specify the part of the activity file from which you want power analysis to use for the power calculation. This option specifies the end time of this range and is used in conjunction with the `-start` option.

Specifies the end time as time-value pairs to report the average power across non-overlapping multiple windows specified in the activity file for a block, level of hierarchy, or other part of the design that you want to analyze. Units are in seconds (s), milliseconds (ms), microseconds (us), nanoseconds (ns), or picoseconds (ps).

*Default:* The time unit is defined in the first .lib file read during design import.

You can specify the `$worst_power_window_end` variable with the `-end` parameter to take the worst case end time from the last vector profiler run.

Not required for TCF and SAIF.

**Note:** You can read multiple windows in a single VCD file by specifying multiple pairs of the start time and end time for the non-overlapping multiple windows specified in the activity file. The use model for reading multiple windows is:

```
read_activity_file -format VCD design.vcd -start {start1 start2 start3} -
end {end1 end2 end3}
```

The `start1/2/3` and `end1/2/3` values should be in the ascending order.

Multiple current waveforms representing multiple VCD windows are merged into a single continuous current waveform. To capture the waveform for signals at the edge of user windows, a buffer time is added between the windows being stitched. This buffer time ensures that the stitched waveform is contiguous. The generated waveform hence has the duration of user windows and the intervening settling buffers. The default settling buffer period is 400ps.

`-format {vcd | tcf | saif | fsdb | phy | shm}`

Specifies the net activity of the design using an activity file in the VCD, TCF, FSDB, SAIF, PHY, or SHM format. The arguments specified with the `-format` parameter are case-insensitive.

- The VCD file format uses the toggle count information as the basis for the power consumption calculation. These files can be in compressed (zipped) format using the .gz extension.
- The TCF file format contains data on the switching activity of the nets in the design. The switching activity includes the toggle count information and the probability of the net or pin being in the logic 1 state. These files can be in compressed (zipped) format using the .gz extension.

Supports extended TCF which contains transition density for X and Z as shown

in the following extended TCF example:

```
"out" : "0.0 0" "0.005000 2" "0.0 0"
```

The fields are defined as follows:

Field 1: net or pin name

Field 2: duty and transition density for transition of 0-1

Field 3: duty and transition density for transition of X(0-X-1)

Field 4: duty and transition density for transition of Z(0-Z-1)

- The SAIF file format contains aggregate switching activity information on the nets and/or ports in the design. It does not contain time-based information. This file format is used for quick average power analysis of the design.
- The FSDB file format specifies the net activity of the design using an activity file in FSDB format. The software supports the FSDB version up to 5.8.

#### Use Model

```
read_activity_file -format fsdb fsdbfile
```

```
report_power
```

(or)

```
report_vector_profile
```

#### Example

```
read_activity_file -format fsdb test.fsdb -scope top
```

- The PHY (Palladium database format generated in the Palladium environment) format contains the simulation activity data generated during emulator-based simulation. The PHY format can be used in all vector-based power analysis flows (vector profiler, static power analysis and dynamic vector-based power analysis).

#### Use Model

```
read_activity_file-format phy <path to PHY database directory>
```

#### Example

```
read_activity_file -format phy ./phy2/trace.phy -scope test
```

#### Notes:

- The xeDebug software must be present in the `PATH` environment. Add xeDebug in the path using the following command:  

```
set path = (<install_dir>/bin $path)
```

The xeDebug software version should be the same as the one using which the PHY database is generated.
- The PHY database generated from the following UXE/VXE version is

supported:

UXE18.6.0 onwards

VXE18.6.0 onwards

- When reading a PHY format activity file, you require a DPA (DPA\_ToggleCountFormat) license.
- For information on error messages displayed while reading the PHY database, refer to the `xe.msg` file in the PHY database directory.
- Make sure that the PHY database is not locked before invoking the software.
- Make sure that the xeDebug software is not already running on the machine.
- Ensure that the following directories are present in the top-level PHY database directory: `*.phy`, `PDB`, `cellList`, `QTDB`, `dbFiles`, and `.design`.
- It is recommended that the write permission is assigned on the entire PHY database. In case the write permission cannot be granted, you must set the `SWFV_FREEZE_PHY` environment variable to 1.
- If you want to run parallel executables on the same top-level PHY directory with multiple `*.phy` databases, it is suggested to create local copies of the multiple top-level directories, with links to the original PHY database. This will allow local copies of the PHY database to acquire separate locks.
- The Simulation History Manager (SHM) database format is a record of the data signal changes that occur during design simulation. The SHM database consists of a directory, typically with the `".shm"` suffix. The directory contains two disk files, namely `*.trn` and `*.dsn`. For more information about the SHM format, refer to the *SimVision Analysis Environment* manual available on the Cadence Online Support (COS) website.

#### Example

```
read_activity_file -format shm ../shm/ADDER.trn -scope adder_e/u1 -
start 0ns -end 60ns
```

`-hierarchy_separator` *separator*

Specifies the separator character in the hierarchical net names, bus names, and pin names for the block or other part of the design that you want to analyze. It must be the same as the separator character in the design netlist.

**Default:** slash (/)

`-name_mapping_rule` *file*

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                | <p>Specifies to enable rule-based mapping to map RTL vectors to gate-level netlist. This parameter helps in resolving name mismatch between RTL and gate level netlists.</p> <p>The name mapping rule file format is:</p> <pre>Name_Mapping_Rule_file # RTL          # Gate &lt;rtlstring&gt; &lt;gatestring&gt;</pre> <p>where, each line is a rule. The string in the first column(RTL) is what we want to replace with the string in the second column(Gate). The rules in every line are added onto the previous rules.</p> <p>For example, to replace all the square [] brackets with under score _ for RTL-to-Gate matching, the rule file will be:</p> <pre>#RTL      #GATE [          _ ]          _</pre> |
| -reset                         | <p>If <b>-reset</b> is specified, all previous activity files specified using the <code>read_activity_file</code> command will be reset and ignored.</p> <p><i>Default:</i> All the previous activity files specified using the <code>read_activity_file</code> command are loaded and used (They are additive).</p>                                                                                                                                                                                                                                                                                                                                                                                               |

|                                | <p>Scales the FSDB/SAIF/TCF/VCD duration value by the specified scale factor. For example, an FSDB scale of 2 will double the FSDB duration value.</p> <p><b>Note:</b> The <b>-start</b> and <b>-end</b> parameters of the <code>read_activity_file</code> command are post scaled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>-scope scope_name</b>       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Specifies the FSDB/SAIF/TCF/VCD scope, that is, the name of the module within the activity file associated with the block or other part of the design that you want to analyze.

The scope argument is removed from the FSDB/SAIF/TCF/VCD name before comparing it to the Verilog file.

 If the scope value has backslash '\ ' or square brackets '[ ]', you must specify the scope within curly brackets '{...}' to ensure that '\ ' or '[ ]' are correctly processed by the Tcl Interpreter. In the following example, the scope value is specified within curly brackets as it contains '\ ' and '[ ]':

```
read_activity_file -scope
{{reg_based_buffer.reg_inst\sv_xpol_trans_q_reg[0][14][7][sv_re]
[4]}}
```

If '\ ' and '[ ]' are not there, curly brackets are not required.

```
-write_net_freq {true | false}
```

This option should be set when an activity from a TCF or VCD file needs to be used to capture net frequency for signal EM analysis (`check_ac_limits`). In addition, you must use the `check_ac_limits -use_db_freq` option to read the toggle rates from the activity file.

*Default:* false

### Example

The following example reads a TCF file which is used to capture net frequency for signal EM analysis:

```
read_activity_file -format tcf -write_net_freq true design.tcf
check_ac_limits -use_db_freq -report signal_em.rpt
```

```
-start { time1 time2 ... timen }
```

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                                      | <p>When you use the vector-driven method of performing dynamic instance-based power-consumption calculation, you can specify the part of the activity file from which you want power analysis to use for the power calculation. This option specifies the start time of this range and is used in conjunction with the <code>-end</code> option.</p> <p>Specifies the start time as time-value pairs to report the average power across non-overlapping multiple windows specified in the VCD file for a block, level of hierarchy, or other part of the design that you want to analyze. Units are in seconds (<code>s</code>), milliseconds (<code>ms</code>), microseconds (<code>us</code>), nanoseconds (<code>ns</code>), or picoseconds (<code>ps</code>).</p> <p><i>Default:</i> The time unit is defined in the first <code>.lib</code> file read during design import.</p> <p>You can specify the <code>\$worst_power_window_start</code> variable with the <code>-start</code> parameter to take the worst case start time from the last vector profiler run. Not required for TCF and SAIF.</p> <p><b>Note:</b> You can read multiple windows in a single VCD file by specifying multiple pairs of the start time and end time for the non-overlapping multiple windows specified in the activity file. The use model for reading multiple windows is:</p> <pre>read_activity_file -format VCD design.vcd -start {start1 start2 start3} - end {end1 end2 end3}</pre> <p>The <code>start1/2/3</code> and <code>end1/2/3</code> values should be in the ascending order.</p> <p>Multiple current waveforms representing multiple VCD windows are merged into a single continuous current waveform. To capture the waveform for signals at the edge of user windows, a buffer time is added between the windows being stitched. This buffer time ensures that the stitched waveform is contiguous. The generated waveform hence has the duration of user windows and the intervening settling buffers. The default settling buffer period is 400ps.</p> |

|                          | <p>Specifies the weight number of the TCF file. 1.0 is the default value. The value should be a floating number that is smaller than 1.0. This parameter allows you to merge multiple TCF files at different function modes for static power estimation of a design.</p> <p>In the following example, TCF <i>file1</i>, <i>file2</i>, and <i>file3</i> has the weight numbers 0.3, 0.2, and 0.4, respectively.</p> <pre>read_activity_file -format TCF  file1 -weight 0.3 read_activity_file -format TCF  file2 -weight 0.2 read_activity_file -format TCF  file3 -weight 0.4</pre> <p>Here, <i>file1</i>, <i>file2</i>, and <i>file3</i> will be merged together to represent the toggle and duty for the nets/pins in the design. The relative weight of 0.3/0.9, 0.2/0.9, and 0.4/0.9 would be used for static power calculation. In this example, 0.9 is the sum of weights.</p> |
| -zero_delay {true false} |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                          | <p>Specifies to process the vector as a zero-delay vector and perform delay annotation.</p> <p><i>Default:</i> false</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Activity Precedence

The following commands can define activity:

```
read_activity_file file
 [-format { VCD | TCF | SAIF | FSDB }]
 [-hierarchy_separator separator]
 [-start time]
 [-end time]
 [-reset]
 [-scope scope_name]
 [-block block_name]

set_default_switching_activity
 [-input_activity factor]
 [-seq_activity factor]
 [-period value]
 [-duty value]
 [-global_activity factor]
 [-hier hierarchy _name]
 [-clock_gates_output activity_factor]
```

```
set_switching_activity
 [-reset]
 [-clock clock_name]
 [-period value]
 [-unclocked]
 [-activity factor | -density transition_density]
 [-net net_name | -port port_name | -pin pin_name]
 [-duty value]
 [-inst]
```

The precedence of activity is as follows:

1. User-Defined: Activities applied to specific nets/pins/ports
2. Activity File: Activity specification through a VCD/FSDB/SAIF/TCF format
3. Clock Gates Output Activity: Activity specification to the output of all clock gates
4. SDC/TWF constants: Set constants to a list of pins or ports for use by the timing engine (timing analysis)
5. Hierarchical Global Activity: Activity specification for a specific hierarchy
6. Global Activity: Activity specification for all instances that are part of the data network.
7. Sequential Element Activity: Activity specification applied to the output of all sequential elements.
8. Primary Input Activity: Activity specification for all primary inputs

If you specify multiple activity data for the same items, the power engine will use the one with the higher precedence.

## Examples

- The following command reads the compressed ap\_wait\_test\_pll1\_mod.vcd.gz VCD file that contains the toggle count information for the power consumption calculations, specifies the crm\_ap module within the VCD file as the module associated with the part of the design being analyzed, specifies the slash character (/) as the hierarchical separator for hierarchical net names, bus names, and pin names for the part of the design being analyzed, and specifies the start (180002ns) and end (189802ns) times from the VCD file for the part of the design being analyzed:

```
read_activity_file -format VCD \
-scope testbench/top/ap/mcu_platform/crm_ap \
-hier_separator \
-start 180002ns \
-end 189802ns \
ap_wait_test_pll1_mod.vcd.gz
```

- The following command reads the compressed A.vcd.gz VCD file that contains the toggle count

information for the power consumption calculations, specifies A1 as the block to map a sub-block VCD file with a block instance at the top-level, and specifies the start (180002ns) and end (189802ns) times from the VCD file for the part of the design being analyzed:

```
read_activity_file -format VCD \
-block ap/A1 \
-start 180002ns \
-end 189802ns \
A.vcd.gz
```

- The next example specifies a VCD activity file called dmac\_mac.vcd for the scope top/dma\_dut.

```
read_activity_file -format VCD -start 10ns -end 20ns \
-scope top/dma_dut dmac_mac.vcd
```

- The following command specifies multiple pairs of the start time and end time for the multiple windows in the VCD file:

```
read_activity_file \
-format VCD \
-scope adder/u1 \
-start {0ps 2000ps} \
-end {1100ps 3100ps} \
-block ../vcd/dut_5buf_full_chip.vcd
```

## Related Commands

- `report_power`

# read\_activity\_map\_file

```
read_activity_map_file
[-help]
[-golden {rtl | gate}]
[-gate_block block_name]
[-reset]
[-rtl_block block_name]
-rtl_to_gate mapping_file
[-two_column_mapping_file mapping_file]
```

Specifies instance name mapping between RTL netlist and GATE level netlist. Power analysis uses this instance name mapping to annotate the output nets of this instance from the pin based RTL VCD or TCF.

You must specify this command before `report_power`.

## Parameters

|                                     |                                                                                                                                                                                                                                                                              |

|  | <code>-rtl_to_gate mapping_file</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|  | Specifies instance name mapping between RTL netlist and GATE level netlist. RTL level VCD or TCF are obtained from simulation on RTL Verilog netlist. Power analysis uses this instance name mapping to annotate the output nets of this instance from the pin based RTL VCD or TCF.                                                                                                                                                                                                                                                               |
|  | <code>-rtl_block block_name</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|  | Specifies the RTL activity block name to map the block-level RTL mapping files to the top-level RTL activity files. The RTL block name is appended before the RTL level entries in the mapping file to match the entries in the top-level RTL activity file.                                                                                                                                                                                                                                                                                       |
|  | <code>-two_column_mapping_file mapping_file</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|  | <p>Specifies a file that contains the instance name mapping between the RTL netlist and GATE level netlist.</p> <p>This parameter can be used to specify a mapping file instead of the LEC generated mapping file (<code>-rtl_to_gate mapping_file</code>) to map points from RTL to Gate netlist. The format of the two column mapping file is:</p> <pre>#Gate name =&gt; # RTL name gate_inst_name1 =&gt; rtl_inst_name1 ...</pre> <p>Here, the first column corresponds to the gate name and the second column corresponds to the RTL name.</p> |

## Example

- The following command specifies a mapping file `rtl_map`:  
`read_activity_map_file -rtl_to_gate rtl_map`
- The following command performs instance name mapping between RTL netlist and GATE level netlist, wherein the GATE level netlist is Golden and the RTL netlist is Revised; it specifies the mapping file `MapFile.alt`  
`read_activity_map_file -rtl_to_gate MapFile.alt -golden gate`
- The following commands appends the RTL block name and GATE block name before the RTL and GATE level entries in the mapping file to match the entries in the top-level RTL activity file:  
`read_activity_map_file -rtl_to_gate LEC.top \  
-rtl_block "core/block_top" \  
-gate_block "core/block_top"`

An example of the mapping file output from Conformal is described as follows:

Mapped points: SYSTEM class  
1-th mapped points:  
    (G) + 1 PI /x\_ick  
    (R) + 595 PI /x\_ick  
2-th mapped points:  
    (G) + 2 PI /x\_jreset\_cp\_p  
    (R) + 594 PI /x\_jreset\_cp\_p  
3-th mapped points:  
    (G) + 3 PI /x\_mreset\_cp\_p  
    (R) + 593 PI /x\_mreset\_cp\_p  
.....  
60-th mapped points:  
    (G) + 4582 DFF /cpexec0/cpddecls0/gi\_opls/q\_reg\_reg[35]  
    (R) + 3856 DFF /cpexec0/cpddecls0/gi\_opls/q\_reg\_reg\_35\_  
61-th mapped points:  
    (G) + 4583 DFF /cpexec0/cpddecls0/gi\_opls/q\_reg\_reg[34]  
    (R) + 3855 DFF /cpexec0/cpddecls0/gi\_opls/q\_reg\_reg\_34\_  
62-th mapped points:  
    (G) + 4633 DFF /cpexec0/cpddecex0/gi\_opex/q\_reg\_reg[21]  
    (R) + 3805 DFF /cpexec0/cpddecex0/gi\_opex/q\_reg\_reg\_21\_  
63-th mapped points:  
    (G) + 4634 DFF /cpexec0/cpddecex0/gi\_opex/q\_reg\_reg[20]  
    (R) + 3804 DFF /cpexec0/cpddecex0/gi\_opex/q\_reg\_reg\_20\_  
64-th mapped points:  
    (G) + 4635 DFF /cpexec0/cpddecex0/gi\_opex/q\_reg\_reg[19]  
    (R) + 3803 DFF /cpexec0/cpddecex0/gi\_opex/q\_reg\_reg\_19\_  
65-th mapped points:  
    (G) + 4636 DFF /cpexec0/cpddecex0/gi\_opex/q\_reg\_reg[18]  
    (R) + 3802 DFF /cpexec0/cpddecex0/gi\_opex/q\_reg\_reg\_18\_

where, **G** refers to the Golden netlist name and **R** refers to the Revised netlist name.

By default, the tool assumes that the Golden netlist name refers to the RTL net name and Revised netlist refers to the GATE level net name.

# read\_power\_db

```
read_power_db
[-help]
-in_file {file1 file2 file3 ...}
[-hierarchy {prefix1 prefix2 prefix3 ...}]
[-hierarchy_separator "/"]
```

Restores any `power.db` file in the Voltus/Tempus session. This command can be used after restoration of a design to view the static power results or incremental report generation without having to do power analysis again.

Note: You will be able to restore the power database that you created previously, only if you created the power database using the `power_write_db` attribute. Also, the command loads power databases created in the 9.1 release only, and not in the older releases.

- The command can map a hierarchical instance to a flat netlist.
- It can restore multiple power dbs for blocks and top level, that are generated separately.
- When the information for a net or an instance is present in multiple power dbs, the last one will overwrite.

## Parameters

|                                          |                                                                                                                                                                                                                                                            |

Specifies the separator character in the hierarchical net names, bus names, and pin names for the block or other part of the design that you want to analyze. It must be the same as the separator character in the design netlist.

This is an optional parameter.

*Default:* slash (/)

## Use Model

```
read_db / read_design
read_power_db -in_file power.db
report_power # for text based power reports
```

## Example

For each instance in file 'file2' a prefix "A" is added to instance name such as instC, A/instC. No prefix is added to 'file1' since prefix1 is none for file1.

```
read_power_db -in_file {file1 file2} -hierarchy {none A}
```

# read\_temperature

```
read_temperature
[-help]
[-default_temperature value]
[in_file filename]
[-reset]
```

Loads the instance-based temperature information to account for the effects of temperature when calculating the delays and slews.

## Parameters

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -help                      | Prints out the command usage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| -default_temperature value | Specifies the default temperature value (in celsius) to use.<br><b>Note:</b> The temperature settings in the temperature file take precedence over this parameter.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| -in_file filename          | Specifies the name of the temperature file that contains the instance-based temperature values (in celsius). When used with the -default_temperature option, the instances that do not appear in these files will use the specified default temperature. The format of the temperature file is as follows:<br><br>VERSION "1.0" ;<br>CREATION "Date" ;<br>PROGRAM "Vendor" `<br><br>DIVIDECHAR "/" ;<br>TEMPERATURE_UNIT "C" ;<br>- instance1 temperature ;<br>- instance2 temperature ;<br>- instance3 temperature ;<br>- instance4 temperature ;<br>- instance5 temperature ;<br>- END; |
| -reset                     | Resets all the temperature settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Examples

- The following command loads the temperature file named `sampletemp`:  

```
tempus > read_temperature -in_file sampletemp
```

## Related Commands

- `set_instance_temperature_file`

# report\_inst\_power

```
report_inst_power
[-help] instance [-out_file filename] [-inst_file filename]
```

Generates a text based report for the specified instance. This command enables you to determine how the different components of static power are calculated. You can use the report to debug static power numbers after performing power analysis (`report_power`).

This command is available through both the static and dynamic power engines.

**Note:** For dynamic power engine, the `report_inst_power` command does not generate text reports incrementally. If the dynamic run has been performed and you need the debug information for a static power number, you should re-run power analysis.

## Parameters

|                                  |                                                                                                                                                                                                                         |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-out_file filename</code>  | Writes out the static power analysis report into the file that you specify.                                                                                                                                             |
| <code>-help</code>               | Outputs the command usage and a brief description about the command parameters.                                                                                                                                         |
| <code>instance</code>            | Specifies the instances to include in the instance power report.                                                                                                                                                        |
| <code>-inst_file filename</code> | <p>Specifies a file that includes a list of instances. The parameter allows you to report and debug power numbers for multiple instances.</p> <p>A sample file is given below:</p> <pre>INST1<br/>INST2<br/>INST3</pre> |

## Example

- The following command specifies an instance power report file `debug.rep` for the instance `top/i_1`:  

```
report_inst_power -out_file debug.rep top/i_1
```

```

Reports global as well as specific instance power, clock network power, clock domain power, and net switching power. It also reports the power for power domains and specific power nets. Units are reported in milliwatts.

This command starts the execution of power analysis (both static and dynamic).

 The parameters of the `report_power` command, except `-cap`, are not supported in the dynamic only mode (specified using the `power_disable_static` attribute). These parameters are only supported in the static mode. However, `-clock_gating_efficiency`, `-register_gating_efficiency`, and `-power_domain` parameters are not supported even if the static power mode is enabled.

## Parameters

|                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                               | Specifies to generate a report that gives the ratio of combinational versus sequential power for each given hierarchy. You must specify this parameter with the <code>-insts</code> parameter.                                                                                                                                                                                                           |
| <code>-compress compression_ratio</code>      |                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                               | <p>Specifies to compress the power analysis report files in the GNU Zip format. suffix <code>.gz</code>.</p> <p><code>compression_ratio</code> is from 0-9. 0 indicates that the report files are not to be compressed. 1 varies from 1 to 9. 1 provides the fastest compression speed but at a lower ratio. 9 provides the highest compression ratio but at a lower speed.</p> <p><i>Default: 0</i></p> |
| <code>-distribute</code>                      | Enables standalone distributed power analysis. This parameter allows you to use the multi-CPU mode without running rail analysis.                                                                                                                                                                                                                                                                        |
| <code>-exclude_cells {cell_list}</code>       |                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                               | Specifies a list of cells that should be excluded from power analysis.                                                                                                                                                                                                                                                                                                                                   |
| <code>-exclude_cells_file filename</code>     |                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                               | Specifies a file containing a list of cells (one per line) which should be excluded from power analysis.                                                                                                                                                                                                                                                                                                 |
| <code>-exclude_instances_file filename</code> |                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                               | Specifies a file containing a list of instances (one per line) which should be excluded from power analysis.                                                                                                                                                                                                                                                                                             |
| <code>-exclude_insts {instance_list}</code>   |                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                               | Specifies a list of instances that should be excluded from power analysis.                                                                                                                                                                                                                                                                                                                               |
| <code>-float_precision value</code>           |                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                               | Sets the precision value to be used for power report generation. The default is 6.                                                                                                                                                                                                                                                                                                                       |

Specifies to report power (internal/switching/leakage/total) for a user-defined under a power group in the power summary report. You can use the following power groups:

- `define_property` - define a property.
- `set_property` - assign the defined property (group type) and its value (power)

The use model of the `-group_type` parameter is:

```
report_power -group_type user_defined_group_type
```

Here, `user_defined_group_type` is the user-defined power group type applied. If the `-group_type` parameter is specified, the command reports power for the specified group type in the power summary report.

### Example:

The following command defines the `poly_bias` property (group type) on library cells:

```
define_property poly_bias -obj_type lib_cell -type string
```

The following commands apply the property `poly_bias` with the group name `P0` and `P10`:

```
set_property [get_lib_cells -of_objects [get_cells -hierarchical * -poly_bias P0
set_property [get_lib_cells -of_objects [get_cells -hierarchical * -poly_bias P10
```

The following command reports power for the user-defined power groups `P0` and `P10`:

```
report_power -out_file basic_group_type.rpt -group_type poly_bias
```

The following is a snippet of the power report that shows the user-defined power groups `P0` and `P10` associated with the property `poly_bias`, in addition to the existing groups (sequential, macro, IO, combinational, clock, etc.).

| User Group | Internal Power | Switching Power | Leakage Power | Total Power (W) |
|------------|----------------|-----------------|---------------|-----------------|
| P0         | 0.01498        | 0.0002017       | 0.01765       | 0.03283         |
| P10        | 0.1268         | 0.04026         | 0.01011       | 0.1772          |
| Total      | 0.1418         | 0.04047         | 0.02776       | 0.21            |

| Group                 | Internal Power | Switching Power | Leakage Power | Total Power (W) | Percent (%) |
|-----------------------|----------------|-----------------|---------------|-----------------|-------------|

| <code>-stat</code>                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Reports a set of statistics on the net status after propagation, for example, the `report_power` parameter is useful in viewing and debugging user-defined activity factors a

**Example:**

```
report_power -time_based_report -distribute -out_file power.rpt -sta
```

```

-- Net status after propagation --

```

| Net   | Transition | Density | Duty | Activity |
|-------|------------|---------|------|----------|
| VDDA1 | 0          | 1       | 0    | 1.25e    |
| VSSA1 | 0          | 0       | 0    | 1.25e    |
| ...   |            |         |      |          |

```
-thermal_conductivity_inputs file_name
```

Specifies a file containing the thermal conductivity value for layers. You can specify the thermal conductivity value of the following layers in the power map file:

- Silicon
- Metal
- Dielectric
- Micro Bump (optional for 3DIC design)
- Fill material in micro bump layer (optional for 3DIC design)

The thermal conductivity file format is:

**Section 1 (layer type based thermal conductivity value)**

```
#default
$layer_type1 $thermal_conductivity_parameter1
$layer_type2 $thermal_conductivity_parameter2
...
```

**Section 2 (layer name based thermal conductivity value)**

```
#perlayer
$layer1_name $thermal_conductivity_parameter1 $dielectric_thermal_co
$layer2_name $thermal_conductivity_parameter2 $dielectric_thermal_co
...
```

Here,

- You can either specify both Section 1 (layer type based) and Section 2 (layer name based) or only one of the two sections. If both sections are specified, then layer name based section overrides the layer type based section.
- The layer name based section has thermal conductivity value and its dielectric constant value for each metal/via layer.

- If section 2 has no parameters defined, the software will use the default p

**Example:**

###default

Metal 430  
Silicon 250  
Dielectric 0.6

###Perlayer

Metal1 430 0.4  
Via1 410 0.5  
Metal2 390 0.5  
Via2 410 0.5

...

For information on the thermal conductivity input file and power map file, refer to the "EM Analysis" chapter in *Voltus User Guide*.

-thermal\_leakage\_temperature {temp1 temp2 temp3 ...}

Defines the temperature to calculate leakage for the power map file.

-thermal\_leakage\_temperature\_scale\_table {\$temp1 \$scalefactor1 \$temp2 \$scalefactor2 \$temp3 \$.

Specifies the global scale factor for a temperature value to enable scaling of power values from the input dotlib file. This parameter allows you to scale the power value at different temperatures.

This parameter allows you to generate a multi-temperature leakage power map file in the power map generation flow. -thermal\_leakage\_temperature\_scale\_table thermal\_leakage\_temperature\_scale\_table\_file are mutually exclusive.

-thermal\_leakage\_temperature\_scale\_table\_file filename

|                                                     | <p>Specifies the active timing view that was created using the multi-mode multi-view <code>-setup -hold</code> command. Power analysis is performed for the specified view name in the output file even if you do not specify the <code>-view</code> parameter.</p> <p>If <code>report_power -view view_name</code> is set, it will override the view set in the <code>power_report</code> command. If <code>set_analysis_view -dynamic</code> and <code>-leakage</code> parameters are specified, then the <code>set_analysis_view</code> command parameters have higher priority over the <code>report_power</code> command.</p> <p><i>Default:</i> Uses current view in Tempus</p> |

## Examples

- The following command reports the amount of power consumed by the clock nets `clk` and `test_clk` (including leaf flip-flop power) and writes the output information to a power report file named `clk_pwr.rep`:

```
report_power -clock_network{clk test_clk} \
-include_sequential_in_clock -out_file clk_pwr.rep
```

- The following command reports the amount of power consumed down to hierarchy level 3 from the top and writes the output information to a power report file named hier.rep:

```
report_power -hierarchy 3 -out_file hier.rep
```

- The following command compresses the power report file pg\_net.rep with gzip:

```
report_power -out_file pg_net.rep.gz
```

- The following command reports the amount of power consumed by leaf-level instances that match ECO\* and writes the output information to a power report file named inst.rep:

```
report_power -insts ECO* -out_file inst.rep
```

- The following command reports the amount of power consumed by all cells that match buf\*6 and writes the output information to a power report file named cell.rep:

```
report_power -cell buf*6 -out_file cell.rep
```

- The following command reports the amount of power consumed by all I/O and sequential cells and writes the output information to a power report file named cell\_type.rep:

```
report_power -cell_type {io sequential} -out_file cell_type.rep
```

- The following command sorts the instance-based power consumption data by leakage power and writes the output information to a power report file named sort.rep:

```
report_power -sort leakage -out_file sort.rep
```

- The following command reports the total power of all instances whose total power dissipation is less than 1 milliwatt and writes the output information to a power report file named threshold.rep:

```
report_power -threshold 1 -out_file threshold.rep
```

- The following command reports the net switching power, load capacitance, toggle rate, and switching values for each net in the design, reports the top 100 nets with the highest net switching power, and writes the output information to a power report file named net.rep:

```
report_power -net -nworst 100 -out_file net.rep
```

- The following command reports the amount of power consumed by each power domain and writes the output information to a power report file named pd\_all.rep:

```
report_power -power_domain all -out_file pd_all.rep
```

- The following command reports the amount of power consumed by each power domain PD2 and writes the output information to a power report file named pd.rep:

```
report_power -power_domain PD2 -out_file pd.rep
```

- The following command reports the amount of power consumed by view view\_max-hp-max-lp1 and writes the output information to a power report file named view.rep:

```
report_power -view view_max-hp-max-lp1 -out_file view.rep
```

- The following command reports the amount of power consumed by each instance connected to power nets vdd and vdd1 and writes the output information to a power report file named pg\_net.rep:

```
report_power -pg_net {vdd vddl} -out_file pg_net.rep
```

- The following command reports the leakage for the threshold voltage group HVT:

```
report_power -leakage -threshold_voltage_group { HVT }
```

- The following command writes out a detailed vector profiling report for the combinational and macro cell types in the `vectorprofile.rpt` file:

```
report_power -time_based_report -out_file vectorprofile.rpt -cell_type {combinational macro}
```

- The following command is an example of generating multiple reports at the same time:

```
report_power -out_dir static_power -report_prefix design -net {name1} -insts {inst_name}
```

The following reports will be generated:

```
static_power/design.rpt
static_power/design.netpwr.rpt
static_power/design.instpwr.rpt
```

- The following command specifies to report power for combinational cells on the clock network.

```
report_power -cell_type clock_combinational -out_file static_power/power_clk.rpt
```

- The following command specifies to report the power content for the `inst1` hierarchical instance in the `report.hierinstpwr.rpt` report:

```
report_power -output static -report_prefix report -clock_network {all} -instances * -no_wrap -hierarchy {all} -hierarchical_instances inst1 -cell_type {all}
```

- The following command generates a power map file in the simple format for the specified tile:

```
report_power -out_file powermeter.txt -thermal_power_map_file powermap.txt -thermal_power_map_tiles { 4 6 } -thermal_power_map_format simple
```

- Example of the output of the power report.

# report\_unannotated\_nets

```
report_unannotated_nets
[-help]
[-file filename]
-type annotationType
```

Shows the percentage of nets annotated by a specific type and also prints the names of all nets that are not annotated by that type. Annotation information is stored on a per-file basis for activity, VCD, TCF, and user commands to provide detailed annotation reports when requested.

`report_unannotated_nets` can be invoked multiple times with different report types (`-type`). You must specify this command before `report_power`.

## Parameters

|                             |                                                                                                                                                                                                                                                                                  |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-file filename</code> | Specifies the text file name that includes the annotation report information. If no file is specified, the report will be written to the default output file <code>annotation_type.log</code> , where <code>type</code> is taken from the <code>-type</code> argument specified. |
| <code>-help</code>          | Outputs the command usage and a brief description about the command parameters.                                                                                                                                                                                                  |

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-type</code><br><i>annotationType</i> | <p>The type can be any of the following:</p> <ul style="list-style-type: none"><li>• <code>all</code><br/>Shows annotation reports for all types.</li><li>• <code>activity</code><br/>Shows annotation data for all types of activity specifications including TCF, VCD, SDC, TWF, and user commands that set activity.</li><li>• <code>cap</code><br/>Shows annotations from the SPEF files.</li><li>• <code>fsdb</code><br/>Shows annotations from the FSDB files.</li><li>• <code>saif</code><br/>Shows annotations from the SAIF files.</li><li>• <code>tcf</code><br/>Shows annotations from the TCF files.</li><li>• <code>timing</code><br/>Shows annotations from the TWF files. This type is applicable only to the dynamic power analysis flow.</li><li>• <code>vcd</code><br/>Shows annotation from the VCD files.</li></ul> |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Example

- The following command dumps the nets in the netlist that are missing in the vcd file:

```
report_unannotated_nets -type vcd -file vcd.log
```

The net names are written in the file `vcd.log`.

- The following command dumps the nets in the netlist which do not have an activity annotated from any source (VCD/TCF/SDC/TWF/user defined) and writes the net names in the file

```
unannotatednets.log:
```

```
report_unannotated_nets -type all -file unannotatednets.log
```

# reset\_power\_activity

reset\_power\_activity

Resets all activity in the database. You can specify this command to reset all activity and power information in a given session.

 You can reset activity from an activity file using `read_activity_file -reset`, reset activity for nets, pins, and ports using `set_switching_activity -reset`, and reset the default switching activities using `set_default_switching_activity -reset`.

## Parameters

None

# set\_default\_switching\_activity

```
set_default_switching_activity
[-black_box_density value]
[-black_box_duty value]
[-block string]
[-duty value]
[-global_activity factor]
[-hierarchy hierarchy_name]
[-input_activity factor]
[-period value]
[-pg_net netname]
[-sequential_activity factor]
[-reset]
[-reset_type { global_activity | seq_activity ... }]
[-clock_gates_enable {activity_factor}]
[-integrated_clock_gate_ratio num]
[-combinational_clock_gate_ratio num]
[-clock_gates_output_ratio num]
[-clip_activity_to_domain_freq {true | false}]
[-clock_gates_output {activity_factor}]
[-name activity_name]
[-macro_activity factor]
```

Specifies the switching activity for all primary inputs, nets, and other devices in the design whose activity has not been previously defined through user attributes, the toggle count format (TCF) file, the simulation vectors file (VCD, SHM, and so on), or the tracing of the clock network.

You can use this command to specify user-defined activities at the design level.

## Parameters

|                          |                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

This parameter clips data paths 1x frequency whereas the clock networks are still at 2x frequency. This parameter allows you to have more control to determine the rate of clipping with respect to frequency.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                                               | <p>Specifies the activity factor for macros in a design. The allowed values for this parameter are between 0 to 1.</p> <p>If you set the macro activity to .30, 30% of macros in the design would be selected for switching in a given cycle during dynamic simulation. When <code>-macro_activity</code> is specified for the static power analysis, all output pins of the macros are assigned the specified activity.</p> <p><i>Default:</i> 0.2</p>        |

|                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-name activity_name</code>         | <p>Allows you to set the activity level for the specified jitter activity name. You can define a low/high activity level for jitter analysis.</p> <p><b>Examples:</b></p> <pre>set_default_switching_activity -name low -clock_gates_output 0 - global_activity 0.01 set_default_switching_activity -name high -clock_gates_output 2 - global_activity 0.2</pre>                                                                                                                                                                                                                                                                                                                                                  |
| <code>-period value</code>               | <p>Specifies the default operating period (1/frequency).</p> <p>Specifies the period that the activity is referenced to. If not specified, the software use the <i>dominant</i> clock in the design.</p> <p>If no clock is specified, the software then generates an error and prompts you to enter one. Units in seconds (<i>s</i>), milliseconds (<i>ms</i>), microseconds (<i>us</i>), nanoseconds (<i>ns</i>), or picoseconds (<i>ps</i>).</p> <p><b>Note:</b> If you enter the period as a negative number, the software reverts back to using the default frequency.</p> <p><i>Default:</i> The time unit is defined in the first <code>.lib</code> file read during design import.</p>                     |
| <code>-pg_net netname</code>             | <p>Specifies the name of the power net for domain-based switching activity assignment. The parameter allows you to define different switching activities for different domains within the same DEF block during stable flop scheduling.</p> <p>When this parameter is specified, the <code>voltus_power.stateprop.swichsrc</code> and <code>voltus_power.stateprop.swichinst</code> reports are affected because the flop toggle values will change.</p> <p>The parameter applies only to dynamic vectorless flow. The <code>-pg_net</code> parameter must be specified with <code>power_honor_default_switching_activity_in_scheduling true</code> attribute for domain-based switching activity assignment.</p> |
| <code>-sequential_activity factor</code> | <p>Specifies the activity of outputs of the sequential logic. This value will be used at the output ports of flops for propagating activity.</p> <p>If the sequential activity is not specified, propagation will be done for the full design starting from the input ports.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                                                                 |                                                                                                                                                                                                   |
|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-reset</code>                                             | Resets all specified options back to default values.                                                                                                                                              |
| <code>-reset_type { global_activity   seq_activity ... }</code> |                                                                                                                                                                                                   |
|                                                                 | <p>Specifies to selectively reset the activity specifications.</p> <p><b>Note:</b> You must use the <code>-reset_type</code> parameter in conjunction with the <code>-reset</code> parameter.</p> |

## Activity Precedence

See "[Activity Precedence](#)".

## Examples

- The following command specifies that the primary inputs in the design will switch once every ten clock cycles, with a clock period of 7520 ns and a duty cycle of 50 percent:

```
set_default_switching_activity -input_activity 0.10 -period 7520ns -duty .5
```

- The following command specifies that all unswitched nodes in the design will switch once every ten clock cycles, with a clock period of 7520 ns and a duty cycle of 50 percent:

```
set_default_switching_activity -global_activity 0.10 -period 7520ns -duty .5
```

- The next example defines the switching activity, sequential activity, and the period:

```
set_default_switching_activity -input_activity 0.2 -period 10 \
 -sequential_activity 0.1
```

- The next example sets the default global activity to 0.5 for the hierarchy `dma_dut`:

```
set_default_switching_activity -global_activity 0.5 -hierarchy dma_dut
```

- The following command resets the sequential and global activity specification:

```
set_default_switching_activity -reset -reset_type
{sequential_activity,global_activity}
```

## Related Commands

- [propagate\\_activity](#)
- [reset\\_power\\_activity](#)

- `set_switching_activity`

# set\_dynamic\_power\_simulation

```
set_dynamic_power_simulation
[-period value]
[-resolution value]
[-reset]
[-activity_pattern {time1 activity_name1 time2 activity_name2 }]
```

Specifies the period and resolution for a dynamic power simulation. This command is used to specify the simulation period in the dynamic vectorbased/vectorless and power-up flows.

## Parameters

|                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><code>-activity_pattern {time1 activity_name1 time2 activity_name2 .... }</code></p> | <p>Divides the total simulation time based on the windows given in the <code>activity_pattern</code> parameter. For a particular window, it uses the defined activity specified with the <code>set_default_switching_activity</code> command.</p> <p>When the user-defined low cycle and high cycle time is specified for the input/sequential activity, all the clocks will be in the low or high cycle until completely past the cycle transition time.</p> <p>Following is the use model of this parameter:</p> <ul style="list-style-type: none"> <li>• <code>set_default_switching_activity -name low -input_activity 0.05 -sequential_activity 0.1 -clock_gates_output 0.2</code></li> <li>• <code>set_default_switching_activity -name high -input_activity 0.1 -sequential_activity 0.2 -clock_gates_output 2.0</code></li> <li>• <code>set_dynamic_power_simulation -resolution 50ps -activity_pattern {0 high 5ns low 10ns high}</code></li> </ul> <p>Here, high activity is used for 0ns to 5ns, low activity is used for 5ns to 10ns, and high activity is used for 10ns to 15ns.</p> |
| <p><code>-period value</code></p>                                                       | <p>Specifies the simulation period that dynamic power analysis will use. The supported time units are <code>s</code>, <code>ms</code>, <code>us</code>, <code>ns</code>, and <code>ps</code>. If no explicit time unit is specified, the default <code>ns</code> (nanosecond) will be applied.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                             |                                                                                                                                                                                                                                              |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -reset                      | Resets all specified options back to default values.                                                                                                                                                                                         |
| -resolution<br><i>value</i> | Specifies the transient time step size or resolution. The supported time units are <i>s</i> , <i>ms</i> , <i>us</i> , <i>ns</i> , and <i>ps</i> . If no explicit time unit is specified, the default <i>ps</i> (picosecond) will be applied. |

## Examples

- The following command sets up the resolution for a dynamic simulation:

```
set_dynamic_power_simulation -resolution 100ps
```

## set\_instance\_temperature\_file

```
set_instance_temperature_file
file
[-reset]
```

Specifies the instance temperature file to support thermal-aware leakage. You can use this command to do thermal-aware power calculation. Based on the temperature specified in the file, the software will calculate temperature and leakage power.

In the presence of a trilib set, the internal and leakage power will be interpolated as the per the given temperature specification.

### Parameters

|             |                                                       |
|-------------|-------------------------------------------------------|
| <i>file</i> | Specifies the name of the instance temperature file.. |
| -reset      | Resets the temperature file.                          |

## set\_power

```
set_power
[value]
[-cap value]
[-fanout_limit value]
[-reset]
[-leakage value]
[-pg_pin {pg_pin}]
[-pg_net railname]
[-pwl_waveform]
[-sticky]
[-dynamic_async_mode { mode_name }]
[-dynamic_switch_pattern pattern]
[-dynamic_switch_event { switching_events }]
[-scale_factor value}]
[-include_ddv_modes {pattern_list}]
[-internal]
[-switching value]
[-clocks {all|clock_name}]
[-exclude_clocks]
[-exclude_ddv_modes {pattern_list}]
[-base_cells cell_name value]
[-insts inst_list value]
[-pin pin_name pin_power]
[-force]
[-custom_macro_pwl_waveform filename]
[-region]
[-repeat]
[-ascii_power_file filename]
[-trigger_time_adjustment time]
[-no_propagation]
[-static_mode { custom_label_name | mode_name }]
[-signal_net netname]
[-slew value]
[-default_dynamic_pgv_mode { mode_name }]
```

Specifies the amount of power for all or part of the design. This command is used to define user-specified power on cells and instances. You must specify this command before [report\\_power](#).

The `set_power` command can accept a cell/instance list using the `get_cells/get_lib_cells` commands. You can use the `get*` commands to create a collection of cells/instances whose name matches the supplied pattern list. Therefore, providing you with the flexibility in providing lists through use of regular filter patterns. This feature is supported in both static and dynamic analysis engines.

## Parameters

|                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-ascii_power_file filename</code>          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                                                  | <p>Specifies the name of an instance list file. This file contains the list of instances in the following format:</p> <pre>instance_name power_value &lt;pin_name&gt;</pre> <p>Here,</p> <ul style="list-style-type: none"> <li>• <i>instance_name</i> is the instance name to which power is to be distributed.</li> <li>• <i>power_value</i> is the power value for the instance in watts.</li> <li>• <i>pin_name</i> is an optional argument to specify the pin name. When specified, allows you to assign power to the specific pin of the instance.</li> <li>• The three fields should be in one line, and each instance should be in a new line.</li> </ul> |
| <code>-base_cells cell_name value</code>         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                                                  | <p>Specifies the cell name. If the cell or instance name is not specified, the power will be distributed to all rails.</p> <p>If you want to specify power for a group of cells/instances, use the <code>get_cells/get_lib_cells</code> commands. The <code>-cells</code> parameter can accept these commands to create a collection of cells/instances whose name matches the supplied pattern list. For example, <code>-cells[get_lib_cells NAND*] 2mw</code></p>                                                                                                                                                                                               |
| <code>-cap value</code>                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                                                  | <p>Specifies the capacitance value to all instances with nets more than or equal to the fanout limit (<code>-fanout_limit</code>).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Specifies stimulus pattern on the pins of an instance and cell. Specify this parameter only in the dynamic mode for the type `instance` and `cell`.

The *pattern* is applied to all pins (input and output) on the instance/cell. It is a string.

*pattern* specifies the switching pattern. If there is more than one clock domain with timing windows on a pin, only the windows on the fastest clock will be used, and the pattern will be applied to that clock period. It is a string of 0, 1, r, and f values. 0 for cycles not to switch and 1 for cycles to switch. r is for rise only and f for fall only.

The pattern string should include enough digits to cover all of the clock cycles in the simulation period. If there are not enough digits, the pattern will be padded with 0 values at the end. If there are too many, the pattern will be truncated to the number of applicable cycles. Transitions will be scheduled in the center of each applicable timing window.

### Notes

- 0 and 1 is supported only in the probability-based vectorless flow. It is not supported in the state-propagation-based vectorless flow and the vector-based flow.
- In case of macros, you can specify the mode names, that is, which mode switches in which clock cycle `-dynamic_switch_pattern { model - mode2 - }`.

You can specify “-” to indicate that instances will not switch in a particular clock cycle. If “-” is the first value in the string of values specified within {}, you must insert a space before “-”, as shown below:

- no switching: `-dynamic_switch_pattern { - - }`
- no switching in the 1st clock period: `-dynamic_switch_pattern { - r }`

### Examples:

In the following example, instance will not switch in the 4th clock cycle:

```
set_power -dynamic_switch_pattern { f r f - r }
```

In the following example, the mode `write` will switch in the 1st clock cycle, the mode `read` will switch in the 2nd and 4th clock cycle, and none of the modes will switch in the 3rd clock cycle:

```
set_power -dynamic_switch_pattern { write read - read }
```

**Note:** You can use the wildcard ( `*` ) character for the `-insts` and `-cell` parameters to specify a pattern of instance/cell names to which the specified switching pattern is to be applied.

```
-dynamic_switch_event { switching_events }
```

If the cell or instance name is not specified, the power will be distributed to all rails.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| -leakage                           | <p>Specifies the target leakage power of the design, cell, instance, or power net. To specify leakage power for cells and instances you can use <code>-leakage</code> option in conjunction with <code>-cells</code> or <code>-insts</code> option.</p> <p>To specify leakage power of a certain power net in the design you can use <code>-pg_net</code> option along with <code>-leakage</code> option.</p>                                                                                                                                                                                                         |
| <code>-no_propagation</code>       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                                    | <p>Specifies that the user-defined switch pattern is applied only after state-propagation is complete. The use model of the command parameter is:</p> <pre>set_power -dynamic_switch_pattern {pattern} -no_propagation</pre> <p>The <code>-no_propagation</code> parameter must be specified with the <code>-dynamic_switch_pattern</code> parameter. When the <code>-no_propagation</code> parameter is specified, the dynamic power engine performs state-propagation first, and then overrides the single instance switching event by the user-defined dynamic switch pattern without any further propagation.</p> |
| <code>-pg_net railname</code>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                      | <p>Optional. The specified power or pwl for the cell, instance or design is applied to the specified rail. When not specified, the power or pwl is applied to all the rails associated with the instance. This option is generally used for MSMV cells.</p> <p>When this option is not specified the behavior is different for pwl and power options. When not specified and power option is used, the power is applied for the whole design, cell, or instance. When not specified and pwl option is used, the pwl is applied to every rail of the cell or instance.</p> |
| <code>-pg_pin {pg_pin}</code>        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                                      | Specifies the switch pattern for a specific PG pin of an instance. This parameter must be specified with the <code>-dynamic_switch_pattern</code> parameter.                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>-pin pin_name pin_power</code> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                                      | <p>Specifies pin-wise power numbers for a specific instance. This parameter allows you to control the power assigned to power ground pins of an instance. Following is the use model of this parameter:</p> <pre>set_power -insts &lt;inst_name&gt; -pin &lt;VDDA&gt; &lt;pin_power&gt; set_power -insts &lt;inst_name&gt; -pin &lt;VDDB&gt; &lt;pin_power&gt;</pre>                                                                                                                                                                                                      |
| <code>-pwl_waveform</code>           | Specifies that power argument ( <code>power</code>   <code>pwl</code> ) is a waveform rather than a power number.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>-region</code>                 | Specifies the region for power target.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>-repeat</code>                 | Repeats dynamic switch pattern of all the clock cycles in the simulation period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>-reset</code>                  | <p>This parameter causes all previous <code>set_power</code> commands to be ignored.</p> <p>Note: You can selectively reset the instance/cell specifications. In addition, you can also selectively reset the cell and instance specifications of a list of objects through the <code>get_cells</code> and <code>get_lib_cells</code> commands.</p>                                                                                                                                                                                                                       |
| <code>-scale_factor value</code>     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                                      | Scales the power value by the specified scale factor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
